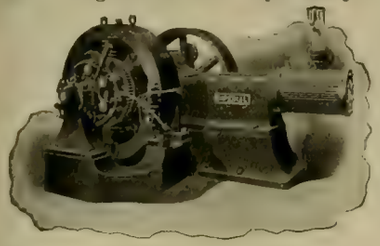
CANTON Drill, Groove and Pick STEEL.
Costs no more than is asked for inferior Steel, and is guaranteed equal to Jessop's best.

Assayers', Miners' and Chemists' Supplies.



Crucibles, Muffles, Furnaces, Etc.
C. P. CYANIDE POTASH (98-99 per cent.)
DIOXIDE SODIUM, ZINC SHAVINGS, BORAX GLASS, C. P. TEST LEAD,
GASOLINE TANKS,
And everything required by Assayers, Miners and Chemists.

Write for a copy of our New Illustrated Catalogue.

F. W. BRAUN & CO.,
401 to 407 N. MAIN STREET,
LOS ANGELES, CALIFORNIA.

The IMPERIAL ENGINES.

Self-Oiling, without Oil Cups, Pumps or Tanks. Adjustable and accessible bearings. Renewable bushings for main and rocker arm bearings. Frictionless four-admission slide valve. Oil chamber entirely separated from steam cylinder contact. Rite's inertia governor. Perfect regulation. All sizes. Simple or compound. Belted or direct connection. High, medium or low speed. Designed for every use.

WESTON ENGINE CO.---Painted Post, N. Y.
C. B. BOOTHE & CO., Los Angeles, Cal., Gen'l Western Ag'ts.
HENDRIE & BOLTHOFF M'F'G CO., Denver, Ag'ts for Colorado.

THE MACHINERY & ELECTRICAL CO.,

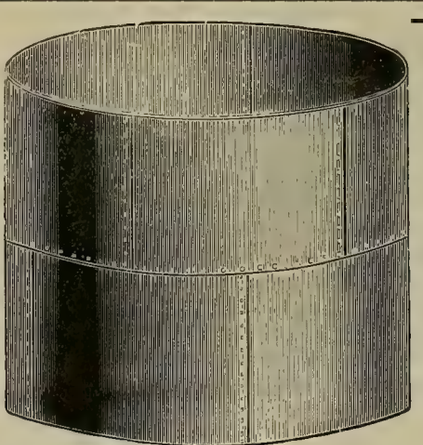
Southern California and Arizona Agents for
Gates Iron Works Mining Machinery.
Stamp Mills, Ore Crushers, Ore Cars, Etc.
Tremain Steam Stamp Mills.
Oil City Boilers and Engines.
Snow Duplex Mine and Sinking Pumps.
Hercules Gasoline Stationary and Hoisting Engines.
Bates Corliss Engines. Ideal Automatic Engines.

Also Dealers and Jobbers in
Machinery and Electrical Supplies.
Shafting, Belting, Pulleys, Packing, Etc.
Incandescent Lamps, Samson, Edison, Leland Batteries.
Construction of Electric Light and Power Plants a Specialty.
Correspondence Invited.

351 and 353 N. Main St., Los Angeles, Cal.

Mining Timber

WRITE TO-DAY and let us make an estimate on your next order for LUMBER, SHINGLES, SHAKES and R. R. TIES. We make a specialty of MINING TIMBER and PLANK for Arizona and Mexico shipment.



The L. W. BLINN LUMBER CO.,
Main Office, 348 E. Second St. = LOS ANGELES, CAL.

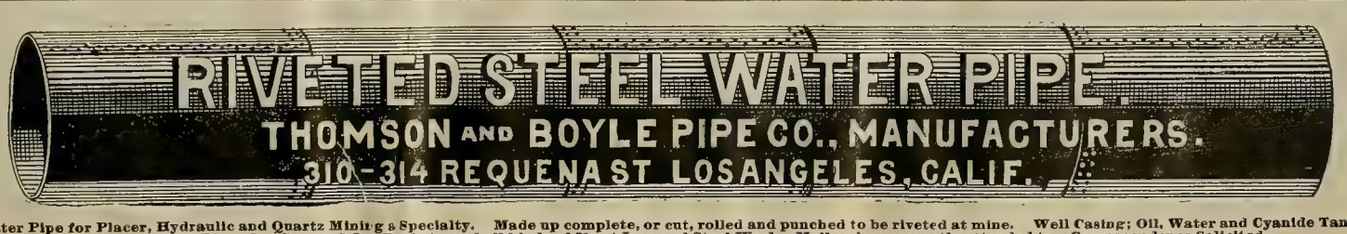
BAKER IRON WORKS,

950 to 956 BUENA VISTA STREET, LOS ANGELES, CAL.

Stamp Mills a Specialty (from two-stamp up). HOISTING ENGINES. Agents for Henry R. Worthington STEAM PUMPING MACHINERY and the ATLAS ENGINES AND BOILERS. General Foundry Work and all kinds of Heavy Forgings. Oil and Water Well Tools. CORRESPONDENCE SOLICITED.

Manufacturers of MINING AND MILLING MACHINERY.

PIPE!



We manufacture Water Pipe for
Hydraulic Mining and Irrigation.

IRRIGATION SUPPLIES OF ALL KINDS.

WELL CASING, OIL TANKS, —AND— General Sheet Iron Work.

Write to us for an estimate on your next job.

Lacy Manufacturing Co., Office, Room 4, Baker Block, LOS ANGELES.

Water Pipe for Placer, Hydraulic and Quartz Mining a Specialty. Made up complete, or cut, rolled and punched to be riveted at mine. Well Casing; Oil, Water and Cyanide Tanks; Galvanized Air Pipe; Ore Cars and Ore Buckets, and all kinds of Sheet Iron and Steel Work. Mail orders promptly attended to. Correspondence Solicited.

Market Reports.

The Markets.

SAN FRANCISCO, Feb. 10, 1898.

General trade continues fair, with the call from up north exceptionally good. The increase from British Columbia, Washington and Oregon is due to the growing demand by outfitters for Alaska and Northwestern Territory. The rush of persons bound for the gold fields there is not only early and very heavy but is increasing. From the tenor of advices given out by railroad and transportation companies on this coast and at the East there will be from 80,000 and up of persons that will go there this year. To transport them there will be large additions to the fleet of vessels in the Alaska service. As near as the writer can learn there will be from eight to twelve large steamers to arrive from the Atlantic which will go into service. Aside from these quite an addition is being made to the fleet by putting steamers on this coast into service.

General rains the past week broke the drouth and also caused a flow of water in mining districts mostly in need of it. The growing weather since the rains has caused a more cheerful feeling, and with the usual rains from now on will insure very large crops of all kinds of farm products. With this assurance there will be more disposition to place loans on farms and other outside propositions. The steadily increasing disbursements of funds by persons bound for the Klondike adds still more to the large sums held by banks. It is estimated by conservative persons that the amount which will be disbursed by Klondikers will average from $500 to $800. If estimates of the number of persons who will go there this year are correct, then there will be expended at San Francisco and other shipping ports from $40,000,000 and upwards. This looks preposterous. Even if one-half is disbursed, it will add very materially to the idle money here and keep the rates of interest down. It ought to stimulate speculation and investments.

New York Silver Prices.

NEW YORK, Feb. 10. — Following are the closing prices for the week:

	—Silver in— London.	N. Y.
Friday	26 1-16	56⅛
Saturday	26¼	56¾
Monday	26¼	56¾
Tuesday	26 1-16	56⅜
Wednesday	26 1-16	56⅜
Thursday	26 1-16	56⅛

	Copper.	Lead.	Iron.	Tin.

Mon.	10 90 @11 00	3 60	10 00@12 00	13 92½
Tue.	10 90 @11 00	3 62½	10 00@12 00	13 90
Wed.	10 90 @11 00	3 65	10 00@12 00	13 92½
Thur.	10 90 @11 00	3 65	10 00@12 00	13 92½

The local bullion, money and exchange quotations current are as follows:

Commercial Loans, % per annum	6
Commercial Loans, prime	5
Call Loans gilt edged	4@4½
Call Loans mixed securities	5@6
Mortgages prime, taxes paid by lender	6@8
New York Sight Draft	17½c Prem
New York Telegraphic Transfer	20c Prem
London Bankers' 60 days	$4.82¾
London Merchants	$4.81½
London Sight Bankers	$4.85½
Refined Silver, per oz., 1000 fine	56½
Mexican Dollars nominal	46@—

SILVER.—The market hung around at low prices throughout the past week. There seems to be an entire absence of any move indicating a demand, either in this country or abroad, other than for legitimate wants. From England our advices are to the effect that with the spring trade there will be an improved call for the white metal, owing to the several nations not having enough to meet much of an increase in general business. It is believed, also, that the Orient will take more. The last steamer hence for Hongkong took out $95,000 in bullion for Hongkong and $42,100 for Bombay.

MEXICAN DOLLARS.—The market is quiet, with prices lower and weak. The last steamer for Hongkong took out $14,409.

COPPER.—The market continues to hold steady at full figures. Eastern advices indicate that the demand is siowly increasing. A New York letter says: "The export movement, particularly to the Continent, is keeping up remarkably well, but prices hold fairly firm, and surface indications are that the large quantity of metal sent from the United States is not more than covering the amount consumed, if, indeed, even doing that. The home trade demand is only fair, however, although improvement is noted in some lines of manufactured goods."

Our market is quoted as follows:

Ingot casting, jobbing	— @13
Ingot " wholesale	— @12½
Sheet copper	— @16½
Bolt ¼ and 5-16, 20c; ⅜ and larger, 16½	

TIN.—In the general situation of the market there is nothing new. There is some decline on sales to arrive of both plate and ingot. For plate the market is irregular.

The market is quoted in jobbing lots as follows:

Pig, per lb., jobbing	—@ 15
Plate, I C coke, heavy, per box	$4 10@4 25
" " " light, "	4 00@—

LEAD.—The market at the East went off but was slightly stronger towards the close. Concessions are obtainable on quotations in our market.

Pig	4 75	@	5 00
Sheet		@	6 50
Pipe	5 30	@	5 80

QUICKSILVER. — The market is quiet. Shipments the past week by sea were 106 flasks to Mexico and ten to New Zealand.

Our market is quoted at $39 for domestic consumption and $35@36 for export to the west coast of Mexico.

IRON.—In our market, and also up north, the consumption of pig is liberal. The East reports a spasmodic demand and, as there is keen competition, selling prices have shaded off.

AMERICAN.	To Arrive.	Spot.
Sloss	$20 00	$22 00
Thomas	21 00	22 00
Salisbury	29 00	31 50
ENGLISH.		
Barrow	$21 00	$23 00
Gartsherrie	21 50	23 00

SHOT.—The market is easy at quotations.

Our market is quoted as follows:

Drop, sizes smaller than B, per bag of 25 lbs	$1 35
Drop, B and larger sizes, " "	1 60
Buck, Balls and Chilled, do, " "	1 60

COAL.—The higher prices asked are causing free shipments to this State of Rocky Mountain coal. This promises to be quite a factor. With lower temperature the consumption of house coals is falling off. Receipts of coal for the week ending with Tuesday were as follows in tons: Departure Bay, 4641; Newcastle, N. S. W., 13,818; Nanaimo, 4233; Coos Bay, 800; Swansea, 2540; Puget Sound, 14,950. Total, 40,982 tons.

SPOT FROM YARD—PER TON.	
Wellington	$10 00@— —
Greta	6 50@— —
Nanaimo	8 00@— —
Gilman	6 50@— —
Seattle	6 50@— —

Australian	6 25
Liverpool Steam	7 00
Scotch Splint	— —
Cardiff	— —
Lehigh Lump	12 00
Cumberland, bulk	9 00
Egg, hard	10 50
West Hartley	7 25

COKE.—Imports the past week aggregate 244 tons from Liverpool.

The market is quoted as follows:

Gas Companies'	— —		— —
English, to load	— —	@	— —
" spot, in bulk	11 00	@	— —
" in sacks	12 00	@	— —
Cumberland	10 00	@	— —

PLATINUM.—The market is steady.

Our market is quoted in a jobbing way at $15 per ounce and for scrap $10 an ounce.

BORAX.—The market is firm, with free shipments to the East, where there is a scarcity.

The market is quoted as follows:

Refined, in carload lots, in barrels	7
Refined, in carload lots in sacks	6¾
Powdered, in car lots	7
Concentrated, "	6¼

ZINC.—The market is steady.

Our market is quoted at 10 to 15 cents, according to thickness.

ALUMINUM.—The market is steady.

We quote in jobbing lots at 45 to 50 cents per pound for ingots.

ANTIMONY.—The market is steady.

POWDER.—The market is steady at current quotations.

The market is quoted as follows for Hercules: No. 1, from 11¾c to 17¼c, according to strength and quantity; No. 2, from 9 to 11c, according to strength and quantity.

Chemicals.

There is a fair distributive demand for the season. Two cargoes of nitrate of soda came in the past week. New York mail advices state that there is a fair demand for all kinds, with quotations unchanged.

CYANIDE OF POTASSIUM.—The market is steady.

Our market is quoted for chemical pure 32 cents per pound for jobbing lots, and 29 cents for carloads.

SULPHURIC ACID.—The market is firm.

We quote in a jobbing way at 1¾c per lb for 66%.

ACETIC ACID.—The market is steady at 6 to 12c per pound from store for carboys, according to make.

NITRIC ACID.—Our market is reported steady from store at 6¾@7c per pound in carboys.

BONEASH.—There is a fair export movement.

Our market is quoted in a jobbing way as follows: Extra, 4c a pound; No. 1, 3¼c; No. 2, 2½c.

BLUE VITRIOL.—Our market is steady.

We quote in a jobbing way at 4c per pound.

SPELTER.—The market is steady.

We quote our market in a jobbing way at 5 cents a pound.

BISMUTH.—The market is firm.

Our market is quoted in a jobbing way at $1.40 a pound.

SODA ASH, 58% (LeBlanc process).—The market is steady at $1.55 per 100 lbs. in a jobbing way.

CAUSTIC SODA, 60%.—The market is steady at 3c per pound in a jobbing way.

HYPOSULPHATE OF SODA.—The market is quiet at 2½c a pound from stores.

NITRATE OF SODA.—The market fluctuates for round lots, but is steady for small.

Our market is quoted from store at 4c for 95%.

PHOSPHORUS.—The market is steady.

We quote in a jobbing way at 70 to 75 cents per pound.

Mining Share Market.

SAN FRANCISCO, Feb. 10, 1898.

The market fluctuated the past week to lower figures for the entire line except Hale & Norcross, Occidental, Standard and Sierra Nevada. The decline in Con. Virginia to 86 cents, although looked for by the better informed, caused lower prices along the entire line with the exception of those noted above. Several assessments became delinquent, but were not carried. The market acts more than ever as if a good-sized deal is on the tapis and that the inside is manipulating for it. If this opinion is correct, then it should not cause surprise if prices go still lower, particularly of the more desirable. Preceding every deal in mining shares, prices have been sent to very low figures, work procrastinated, bear points put out. The manipulator for the inside pool makes lower prices by cross-orders, which bring in chippers who help in the decline, and which is aided still more by margin shares coming in. It has been years since such times were more propitious for high prices. Money is plentiful, and the public throughout the country are ripe for a gamble; but it will take ore and honest management to get the richer class in, both of which can be done when desired by the moneyed pool. The excitement about the Klondike will also help, particularly if large amounts of gold come from there this summer and fall. From all we can learn, the work in the mines is of a character which encourages the belief that before the fall months, most important results will follow. It may be possible in one or two before the spring months pass. It is well known in mining circles that, above the water, good grade ore, mostly gold bearing, has been found; and work for many months, and in two cases several years, has been done, not to develop it, but to tire the public out of their holdings by assessments and making false moves in the share market. While it is desirable to pump out the mines, which will be done in time to resume deep mining, yet the impression that there is no body of good grade ore above the water level is entirely wrong, which will be proven by time.

The news from the Comstock mines points to more active work in several and good results in others, yet it will take time, or until shares are better concentrated. Reports—and seemingly correct, too—are out that on the 1650-foot level important work will be started soon. In Sierra Nevada the ore found is quite important. So far as prospected, it goes about $40 a ton, with 75 per cent gold. It will take two weeks to make connections for air and manway by an upraise, after which the level will be exploited to find the extent of the ore. In Alta prospects are improving, which encourages the management in the belief that a body of good ore may be uncovered. Fair progress is being made in the north drift in Utah. Soft porphyry is being passed through. In Sierra Nevada they are raising from the Riley tunnel to make connection for air and other purposes. With this completed, exploiting this level will be in order, as will extracting ore. The official letter reports taking out eighty-three tons, assaying from $30 to $40 to the ton. The impression prevails with some that this body of ore will be found from 20 to 30 feet wide, yet it may not average so much all the way through. West crosscut No. 5 on the 900-foot level is being pushed ahead at the rate of over 20 feet a week. Work is continued in the north drift on the 900-foot level in Union. The face shows porphyry, vein matter and clay seams. The letter from Mexican reports work only on the 1000-foot level going east. In Ophir crosscutting to the west is being done on the 1000-foot and Central tunnel levels. It seems as if they ought to be nearing the west ledge on the former level. In Con. Virginia work is confined to and around the 1550-foot, 1650-foot and 1750-foot levels. The official letter does not report any material change, but it is understood that since Mr. Flood's return from consulting with J. W. Mackay, word has gone to Virginia City to start more important work in that mine at an early day; but, before it is done, an assessment will probably be levied by Ophir and also Con. Virginia. Work is continued by Best & Belcher and Gould & Curry on the joint east crossdrift on the 800-foot Bonner shaft level. The work in Savage ought to attract attention before long. Nothing doing in Hale & Norcross. In Chollar they are getting ready to resume work to the west on the 550-foot level. They will find ore, unless the work in the crossdrift is stopped. All repairs are said to be completed with the Sutro tunnel on the 1600-foot level. In Potosi no change is reported in the work under way. They are milling the accumulated ore. In Bullion they are still repairing the old Crœsus shaft. Procrastinating work is still the order in Alpha and will probably continue to be until the assessment is off. The surface tunnel in Con. Imperial is in about 500 feet, and the joint Challenge, Confidence and Con. Imperial west crossdrift is in nearly 1800 feet. The flow of water is still quite strong. Nothing new from Challenge and Confidence. In Yellow Jacket the work that is being done is said to be in the right direction, but it is being done so as to kill time, and it will take many weeks to strike ore, even if the work is not stopped. In Crown Point they are raising from the end of the south drift, 750-foot level, and saving some low-grade ore. The joint raise with Belcher from the 850-foot level is up over 80 feet. In Belcher they are cleaning out the north drift on the 1200-foot level. They raised last week thirty-seven tons of ore, assaying $26.59 a ton. In Alta an improvement is reported on the 950-foot level. From Justice nothing new is reported. A few tons of ore are raised, assaying about $20 gold and $12 silver to the ton.

On the Brunswick lode interest centers largely in Potosi in the work on the 600-foot level, towards Occidental. On this level the west crossdrift ran into a well-defined ledge about 35 feet wide, when the work was turned south so as to see what it would lead to. At last advices the ore assayed about $4 and was seemingly improving. The experts said a body of paying ore ought to be found in that direction. The winze in Occidental going down from the 750-foot level is looking well, with the bottom in fair-grade ore. The joint Chollar and Potosi west crossdrift is in over 210 feet. Sinking has been resumed in shaft No. 1. It is down on an incline about 1050 feet. In Chollar they are crossdrifting west on the 200-foot and 500-foot levels. No change is reported in the joint work being done by Con. Virginia, Best & Belcher and Gould & Curry.

The following illustrates the changes for the week:

Assessment Notices.

THE ORLEANS MINING COMPANY. Location of principal place of business, San Francisco, California; location of works, Grass Valley Mining District, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 1st day of February, 1898, an assessment (No. 7, new series) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary at the office of the company, No. 575 Mission street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 8th day of March, 1898, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 28th day of March, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

GEO. O. THURSTON, Secretary.

Office—No. 575 Mission street, San Francisco, California.

FALL RIVER CONSOLIDATED GOLD QUARTZ Company.—Location of principal place of business, San Francisco, California; location of works, Plumas County, California.

Notice is hereby given, that at a meeting of the Board of Directors held on the 15th day of January, 1898, an assessment (No. 11) of 5 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 313-315 Front street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 25th day of February, 1898, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on THURSDAY, the 21st day of April, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

A. LORSBACH, Secretary.

Office—313-315 Front street, San Francisco, California.

THORPE MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Fourth Crossing, Calaveras County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 19th day of January, 1898, an assessment (No. 9) of 2½ cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 44, Phelan building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 26th day of February, 1898, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 21st day of March, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

A. F. FREY, Secretary.

Office—Room 44, Phelan building, San Francisco, California.

DIVIDEND NOTICE.

JAMISON MINING COMPANY, Rooms 50 and 54, 120 Sutter St., San Francisco Cal., January 25th, 1898.

DIVIDEND NUMBER ONE.—At their meeting of January 25th, 1898, it was resolved by the Board of Directors of the Jamison Mining Company to pay to the Stockholders of the Company from the surplus funds in the treasury, a dividend of Nineteen Thousand Five Hundred Dollars ($19,500), being Five Cents (5 cts.) per share on the capital stock of the Company. The dividend will be payable at the office of the Company on the Fifteenth (15th) day of February, 1898, to all stockholders of record on the Fifth (5th) day of February, 1898. Transfer books will be closed at the close of business on the 5th of February, and reopened on the morning of February 16, 1898. SAM. W. CHEYNEY, Secretary.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from William N. Lamb, in the Croff Mine, near Oleta, Amador Co., to deposit tailings behind the dam of the Cumbridge Mine, in Dry Creek; from B. F. Steese and O. Wochler, in the Long Ravine Mine, near Spenceville, Nevada Co., to deposit tailings in Long Ravine; and from J. W. Cummins, in the Amo Mine, near Oroville, Butte Co., to deposit tailings in Cherokee Ravine, gives notice that a meeting will be held at Room 50, Flood Building, San Francisco, Cal., on February 28, 1898, at 2:30 P. M.

DELINQUENT SALE NOTICE.

RED CAP MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Humboldt County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 2) levied on the 20th day of November, 1897, the several amounts set opposite the names of the respective shareholders, as follows:

Name.	No. Cert.	No. Shares.	Amt.
Harvey M. Binckley	2	1	5 00
Alice E. Binckley	20	4	20 00
Alice E. Binckley	23	20	100 00
Alice E. Binckley	24	20	100 00
Alice E. Binckley	25	20	100 00
Alice E. Binckley	26	20	100 00
Alice E. Binckley	39	1	5 00
Alice E. Binckley	40	2	10 00
Caroline S. Townsend	18	20	100 00

And in accordance with law, and an order from the Board of Directors, made on the 29th day of November, 1897, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the corporation, 125 Beale street, San Francisco, California, on SATURDAY, the 29th day of January, 1898, at the hour of 1 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

H. H. MARTIN, Secretary.

Office—125 Beale street, San Francisco, California.

POSTPONEMENT.

By order of the Board of Directors the day of sale of the above delinquent stock has been postponed to SATURDAY, February 26th, 1898, at the same hour and place. H. H. MARTIN, Secretary.

Office—125 Beale street, San Francisco, California.

DELINQUENT SALE NOTICE.

MARINA MARSICANO GOLD MINING COMPANY. Location of principal place of business, San Francisco, California; location of works, Sunny Hill, Shasta County, California.

Notice. There are delinquent upon the following described stock, on account of assessment (No. 12) levied on the 3rd day of January, 1898, the several amounts set opposite the names of the respective shareholders, as follows:

Name.	No. Cert.	No. Shares.	Amt.
L. P. Drexler	87	10	90
Leo Alexander, Trustee	85	17,990	1,619 10

And in accordance with law, and an order from the Board of Directors, made on the 3rd day of January, 1898 so many shares of each parcel of such stock as may be necessary will be sold at public auction, at the office of the company, 217 Sacramento street, San Francisco, California, on MONDAY, the 28th day of February, 1898, at the hour of 2 o'clock P. M of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale. CHARLES BOVONE, Secretary.

Office—217 Sacramento street, San Francisco, California.

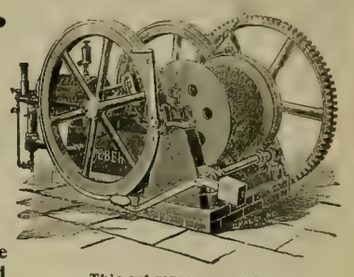
'.Lunkenheimer's.'
GLASS BODY OIL PUMP.



To obtain thorough lubrication, and as an auxiliary to the Sight Feed Lubricator, this pump will be found indispensable, especially before the engine starts running and the lubricator begins to work. Made in four sizes, holding ⅛ pt., ½ pt., 1 pt., 1 qt. Glass Body indicates stage of oil. This is the handsomest pump made and the only one having an all-brass lever and wood wheel.

None as good as "Lunkenheimer's," if you want the best. Every pump tested and warranted. Look for the name. Supplied by dealers. Catalogue gratis.

THE BROWNELL "PATENT LIP" FLANGE FRUE VANNER BELTS.

It has taken years of ceaseless testing and experimenting to produce the superior belt which we now offer, with elastic flanges and pliable body reinforced with specially woven duck. Every belt is manufactured by experienced workmen, and carefully tested on machines especially built for that purpose; consequently we are to-day manufacturing the best belts that mechanical ingenuity, combined with honesty of construction, can possibly produce.

ORIGINAL EMPIRE MILL & MINING COMPANY,
GRASS VALLEY, NEVADA CO., CAL., Feb. 20, 1897.

JAS. S. BROWNELL, FSQ., San Francisco, Cal.—DEAR SIR: The Brownell Patent Lip flange belt for ore concentrators, which I bought of you nearly two years ago, has been in constant use and is in good order and gives us perfect satisfaction. We have several other kinds of belts in the mill, and your belt and flange I consider the best of all. Yours respectfully, ROBT. WALKER, Superintendent.

ROANOKE MINING COMPANY,
MOKELUMNE HILL, March 4, 1897.

MR. JAS. S. BROWNELL, 132 Market St., San Francisco, Cal.—DEAR SIR: We have in our 20-stamp mill at this place five Frue vanners; three of these are equipped with the Patent Lip flange belt and two with the plain flange belt. We certainly consider the former a great improvement on the latter. They will certainly wear much longer, as cracking now seems out of the question. Any one purchasing the Frue vanning machine should see that it is equipped with the Patent Lip flange belt. Very truly yours, ROANOKE MINING COMPANY. Per G. M. WILDE, Acting Superintendent.

MINING AND SCIENTIFIC PRESS.

AND PACIFIC ELECTRICAL REVIEW.

No. 1963.—VOLUME LXXVI. Number 8. SAN FRANCISCO, SATURDAY, FEBRUARY 19, 1898. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

The Newest El Dorado.

The present Klondike excitement will result in putting Alaska and that entire northern region a century in advance of what it would have been in point of development had the Klondike craze not come. Organized government, increased population, facilities of travel, better postal service, knowledge of the country will be among the good results of the present stampede.

For twenty years the columns of this paper contained about all that was to be learned of the mineral wealth of that region, and much that was printed herein is now being circulated all over the world as authentic and reliable data regarding that region. On this page is reproduced from the enterprising *Mining Record* of Juneau some scenes that tell their own story.

120-STAMP MILL OF THE ALASKA-MEXICAN GOLD MINING CO.

AT CIRCLE CITY—ARRIVING FROM THE DIGGINGS.

MINERS AT SHEEP CAMP, BOUND FOR THE KLONDIKE.

Some of the world's energy and treasure is now being devoted to the exploitation of this rich northern storehouse, and the latest and most successful appliances in gold mining are to be applied in the work. In this regard it is interesting to note that the largest stamp mill in the world is shortly to be erected on one of Alaska's gold quartz mines — the Alaska-Treadwell, on Douglas island, illustrating the extent and value of Alaska's quartz milling; and if one-half that is claimed turns out true, the placer yield of the Yukon region will rival in richness the early days of gold product in California.

RIVER IMPROVEMENT, so far as California is concerned, has received a black eye in Congress this session. No appropriation will be made, and, under the circumstances, none could be reasonably expected. There is at present available in the State and national appropriations $800,000, less the salaries of the State officials, who seem to have solely learned how to avoid doing what they were officially created to do.

THE Committee on Public Lands of the House of Representatives has reported favorably on the California mineral lands bill. The report includes letters from Commissioner Hermann and Secretary Bliss, setting forth the amount of land to be classified and the cost which has attended the examination of the lands in Idaho and Montana under similar acts. A strong effort to pass the bill will be made. The committee reports that there are 13,487,602 acres in California subject to such reclassification.

THE advertisements of transportation to Coolgardie and South Africa are seen no more. The Alaska transportation companies on land and sea are doing an enormous present business. The rush northward continues, and apparently has not yet reached its limit. All sorts of old tubs are in use, and occasionally a fearful disaster is reported. Those who are determined to go should at least see that a stout vessel, properly manned, carries them. There are several such craft on the northern route.

A CUBE OF CRYSTAL ICE and a branch covered with large ripe oranges are shown in the Nevada Co. exhibit at the Mining Fair. A modest little placard says "this ice was cut and these oranges were plucked in Nevada county the same day," illustrating the diversity of California climate. There are fifty-seven counties in California, some having an area of over 20,000 square miles. Nevada is comparatively a small county—958 square miles—but, besides ice and oranges, has contributed over $218,000,000 in gold. And there are fifty-six others.

AGENTS securing new subscriptions to this paper are now traversing this west half of America. So far as known, this system is not generally practiced by technical journals; but no matter how large our subscription lists, it is always desirable to have them still larger. The advertiser has very little use for a paper that does not constantly keep up a large subscription list, and a subscriber has as little use for a paper that ceases to be interesting or valuable. It is with pleasure the fact is stated that the number who weekly read this paper is just double what it was four years ago. In this regard it is also in order to say that no one anywhere is authorized to solicit subscriptions for this paper without due authorization and the possession of regularly signed and numbered blank receipts from the business office.

An Unwelcome Ruling.

Since the publication in these columns on the 5th inst. of the latest ruling of the Interior Department and the General Land Office, regarding the important question of how much work must be put on a group of mining claims before patent will be issued, it is evident that nothing in recent years has so stirred the general mining public. Numerous letters have been received by this paper, nearly all expressing the belief that the interests of miners can best be conserved by a general protest against such ruling, and asking for at least a suspension of the ruling for a certain time, to obviate probable trouble and expense to the miners everywhere. This vexatious condition of affairs affects especially those whose applications are pending, and those about to apply for patents under the old ruling. In this connection it is to be noted that the communications from Los Angeles and other southern California subscribers regarding the wording of the editorial of the 5th inst. deserve consideration. To obviate any possible misunderstanding it is here restated, that, whereas, the former ruling governing the amount of work necessary in procuring patents on groups of mining claims was virtually that applicants for U. S. patents could secure patent on a group containing any number of claims upon proper affidavits that $500 worth of labor had been done on a tunnel, shaft, incline or other work where that work was intended to and actually did go to the development of the entire group, this has been changed by paragraph 53 of the new ruling, approved December 15th, 1897 (which was published in full in the issue of the 5th inst.), and which in effect is: That if more than one claim is included in the application for patent, that an amount equal to $500 for each claim in the group for which patent is asked must be shown to have been expended by the applicant or his grantors; so that if one or more owners should apply for patent for a group containing five claims, the affidavits must show that he or they have done $2500 worth of work on one or more claims in the group; or if ten claims, $5000 worth of work.

In addition to these onerous obligations it is to be noted that acting under the former ruling—which was supposed to be of a permanent nature—a great many throughout this entire region made purchases of original locations, and did what under the then ruling was the necessary amount of work on groups of claims; and after having had the required land office surveys made up to the first of the year, made application and paid at the rate of $5 an acre for the claims so applied for. All this expense has been incurred, and now from the wording of the regulation it would seem as though any of those transactions prior to January 1st, 1898, are subject to cancellation.

So far as this paper has been able to obtain information, no one in authority can say just to what extent this new ruling will be retroactive. At this writing, so far as California is concerned, the present Surveyor-General of the State has been displaced by a new appointment from Washington—Mr. Gleaves of Shasta county—and it is impossible to obtain any ruling thereon. Applications for patent under the old ruling are also being advertised in papers throughout the mining regions; and in general this ruling throws everything in connection with it into a state of confusion. Under the circumstances it is believed that the best interests of the miners (in whose interests all this legislation is supposed to be) require that there shall be a suspension of the ruling in question until, say, the first of July, 1898.

There is no desire to comment on the matter, simply make a statement of existing facts. The old ruling was abused in some instances. The new ruling should not have gone into effect with so little time for those whom it affected to guard their interests. The whole thing illustrates forcibly what has so often been stated herein—the absolute need of a Department of Mines and Mining. If it cost a million dollars a year it would be economical in comparison with the present apparently unavoidable system of executive connection with the nation's greatest basic industry.

Deep Mining in Nevada and California.

The article on the deep levels of the Comstock, Nevada, lode, which appeared in the issue of the 5th inst., has been so extensively copied and endorsed as to indicate a general recognition of its truth. In general, the fact that values continue at great depth is daily receiving fresh and additional proof in California, where deep mining pays. The Idaho, Nevada county, 2200 feet deep, the Kennedy, Amador county, 2300 feet deep, the Eureka, Argonaut, Keystone, Gwin and other well-known California mines may be cited. The Eureka, at Sutter Creek, Amador county, paid millions in dividends, worked to the 2200-foot level, and, it is believed, would pay additional millions if pushed 1000 feet deeper. The biggest body of ore ever found in the Kennedy mine, in the same county, was recently developed at a vertical depth of 2200 feet. The Keystone, also in Amador county, was abandoned at the 1300-foot level after paying several millions in dividends. When new owners with different ideas took hold, they sunk deeper and soon had forty stamps dropping on pay ore. The Gwin mine, Calaveras county, is another good example. It also paid many millions in dividends, but at a depth of 1200 feet was abandoned and lay idle for eighteen years. Some California miners who were not afraid to spend money, and who were thoroughly imbued with the belief which this paper has constantly maintained—viz., that deep mining will pay—took hold, spent $150,000, sunk deeper. The result is profit and proof of permanency of the lode at greater depth. The Gwin has what is as large a pay chute as any in the State—over 1300 feet in length. A 40-stamp mill is coining money for its enterprising owners. These are not few or isolated cases. They are illustrative of the fact that deep mining is profitable in California. That deeper mining would be as profitable on the Comstock is almost as self-evident a proposition.

This whole question of deep mining in Nevada and California is worthy of notice in regard to the speculative aspect of the matter. In this State one of the most influential reasons why there had not, up to recently, been more deep mining is that there was never what may be styled public money—that is, money derived from the sale of shares of mining stock. In California most of the quartz and hydraulic mining has been all along done by private individuals or by close corporations who did not care to take the risk of bold ventures involving the expenditure of millions. Usually the mine paid as it went. If it did not pay, it did not go; but there was little laid by as profit or a contingent of working capital, and so when the ore appeared to give out, or the cost of sinking grew too great, or the placer ground ceased to yield very well, operations were discontinued. It was different on the Comstock, where the biggest and boldest mining exploitation in the world was done at an enormous expense, by reason of the fact that the Comstock shares were on the market, were bought and sold, and there was any amount of money. To the purchasers or sellers of these shares in this city or elsewhere it made very little difference what day's wages were paid, or what powder or timbering or machinery cost, most of the buyers holding the stock only over night, and knowing little and caring less as to the future of the mine whose stock they held in fleeting transit. As a matter of fact, it must be said that the value of stock gambling was great to deep mining on the Comstock, inasmuch as it afforded abundant means to carry on the work. While we would not be understood as indorsing or recommending that style of procedure, the idea is worthy of note in connection with consideration of the article on deep mining in the issue of the 5th inst.

ADVICE is asked by several with incipient Klondicitis as to where best to go. The true Alaskamaniac does not want advice; he is already going; he simply wants reinforcement of his opinion. The advice of the MINING AND SCIENTIFIC PRESS is, don't go. However, there are adventurous spirits who deserve to succeed. To those may be pointed out the folly of going to the Klondike, as everything worth taking is taken up, and everything worth holding is held at an enormous figure. There are better chances in such districts as the Copper river, where

ground is still unlocated and may be taken up. The folly of going where everything is already secured, and where even the promise of high wages is discounted by the inevitable reduction in wages in the competition of numbers, is manifest to any one not hypnotized by the wild stories mostly put in circulation for profit.

Prizes for the Winners.

Next Tuesday, the 22nd inst., will be Miners' Day at the Mining Fair. The MINING AND SCIENTIFIC PRESS will give a massive gold championship medal to the prize winner in the drilling contest. Mayor Phelan will also give a gold medal to the champion in the wrestling contest. These are in addition to the prizes mentioned in the following, which are the rules governing the drilling contests on that day:

Double-Handed Championship Contest.—Entrance fee, $10; at least ten teams to enter; down hole. First prize, championship and a purse of $250 in cash and all entrance fees, making a cash prize of at least $350 to go to the winners; second prize, $150 in cash; third prize, purse of $75 in cash; fourth prize, purse of $37.50. All steel must be full size, seven-eighths of an inch. No swedged bits allowed. The smallest bit must measure seven-eighths of an inch. "Milling" hole with two hammers not allowed beyond two blows from each hammer when change is made. Weight of hammer not to exceed eight pounds. Rock to be used, Rocklin granite. Time of contest, fifteen minutes.

Single-Handed Championship Contest.—Entrance fee, $5; ten to enter; down hole. First prize, championship of California, purse of $125 in cash and all entrance fees, making a cash prize of at least $175 to go to the winner; second prize, purse of $75 in cash; third prize, purse of $37.50 in cash; fourth prize, purse of $18.75 in cash. All steel must be full size, three-fourths of an inch. No swedged bits allowed. The smallest bit must measure three-quarters of an inch. Weight of hammer not to exceed four and one-half pounds. Rock to be used, Rocklin granite. Time of contest, fifteen minutes.

Considerable interest has always been taken in these hand drilling contests. The most recent of any note was at Helena, Mont., June 13th, '97, when Davy and Freethy of Butte won first money, drilling 41 5/16 inches in fifteen minutes. The same team made a record of 39 inches in Spokane, Wash., last year. W. Bieber of Lump Gulch, Mont., single-handed, drilled 15⅝ inches in ten minutes.

United States Mining Laws, and Regulations Thereunder, Relative to the Reservation, Exploration, Location, Possession, Purchase and Patenting of the Mineral Lands in the Public Domain.

So many requests are received from all over the west half of America regarding U. S. mining laws that, as a matter of general information, and as the easiest way of answering such inquiries, the latest official compilation of Federal Mining Law is herewith published. It is officially approved by Secretary of the Interior Bliss and Commissioner of the General Land Office Hermann under date of Dec. 15th, '97. Like a good many other things in these columns, this matter is worth preserving for authentic reference on questions that constantly arise:

MINERAL LANDS OPEN TO EXPLORATION, OCCUPATION AND PURCHASE.

SEC. 2318, R. S. In all cases lands valuable for minerals shall be reserved from sale, except as otherwise expressly directed by law.

SEC. 2319. All valuable mineral deposits in lands belonging to the United States, both surveyed and unsurveyed, are hereby declared to be free and open to exploration and purchase, and the lands in which they are found to occupation and purchase, by citizens of the United States and those who have declared their intention to become such, under regulations prescribed by law, and according to the local customs or rules of miners in the several mining districts, so far as the same are applicable and not inconsistent with the laws of the United States.

NATURE AND EXTENT OF MINING CLAIMS.

1. Mining claims are of two distinct classes—lode claims and placers.

LODE CLAIMS.

SEC. 2320. R. S. Mining claims upon veins or lodes of quartz or other rock in place bearing gold, silver, cinnabar, lead, tin, copper or other valuable deposits, heretofore located, shall be governed as to length along the vein or lode by the customs, regulations and laws in force at the date of their location. A mining claim located after the tenth day of May, eighteen hundred and seventy-two, whether located by one or more persons, may equal, but shall not exceed, one thousand five hundred feet in length along the vein or lode; but no location of a mining claim shall be made until the discovery of the vein or lode within the limits of the claim located. No claim shall extend more than three hundred feet on each side of the middle of the vein at the surface, nor shall any claim be limited by any mining regulation to less than twenty-five feet on each side of the middle of the vein at the surface, except where adverse rights existing on the tenth day of May, eighteen hundred and seventy-two, render such limitation necessary. The end lines of each claim shall be parallel to each other.

SEC. 2322. The locators of all mining locations heretofore made, or which shall hereafter be made, on any mineral vein, lode or ledge situated on the public domain, their heirs and assigns, where no adverse claim exists on the tenth day of May, eighteen hundred and seventy-two, so long as they comply with the laws of the United States and with State, Territorial and local regulations not in conflict with the laws of the United States governing their possessory title, shall have the exclusive right of possession and enjoyment of all the surface included within the lines of their locations, and of all veins, lodes and ledges throughout their entire depth, the top or apex of which lies inside of such surface lines extended downward vertically, although such veins, lodes or ledges may so far depart from a perpendicular in their course downward as to extend outside the vertical side lines of such surface locations. But their right of possession to such outside parts of such veins or ledges shall be confined to such portions thereof as the between vertical planes drawn downward as above described, through the end lines of their locations, so continued in their own direction that such planes will intersect such exterior parts of such veins or ledges. And nothing in this section shall authorize the owner or possessor of a vein or lode which extends in its downward course beyond the vertical lines of his claim to enter upon the surface of a claim owned or possessed by another.

SEC. 2336. Where two or more veins intersect or cross each other, priority of title shall govern, and such prior location shall be entitled to all ore or mineral contained within the space of intersection; but the subsequent location shall have the right of way through the space of intersection for the purposes of the convenient working of the mine. And where two or more veins unite, the oldest or prior location shall take the vein below the point of union, including all the space of intersection.

CLAIMS LOCATED OR PATENTED PRIOR TO MAY 10, 1872.

2. The status of lode claims located or patented previous to the 10th day of May, 1872, is not changed with regard to their extent along the lode or width of surface; but the claim is enlarged by sections 2322 and 2328, by investing the locator, his heirs or assigns, with the right to follow, upon the conditions stated therein, all veins, lodes or ledges, the top or apex of which lies inside of the surface lines of his claim.

3. It is to be distinctly understood, however, that the law limits the possessory right to veins, lodes or ledges, *other* than the one named in the original location, to such as were not *adversely claimed on May 10, 1872*, and that where such other vein or ledge was so adversely claimed at that date the right of the party so adversely claiming is in no way impaired by the provisions of the Revised Statutes.

CLAIMS LOCATED SUBSEQUENTLY TO MAY 10, 1872.

4. From and after the 10th day of May, 1872, any person who is a citizen of the United States, or who has declared his intention to become a citizen, may locate, record and hold a mining claim of *fifteen hundred linear feet* along the course of any mineral vein or lode subject to location; or an association of persons, severally qualified as above, may make joint location of such claim of *fifteen hundred feet*, but in no event can a location of a vein or lode made subsequent to May 10, 1872, exceed fifteen hundred feet along the course thereof, whatever may be the number of persons composing the association.

5. With regard to the extent of surface ground adjoining a vein or lode, and claimed for the convenient working thereof, the Revised Statutes provide that the lateral extent of locations of veins or lodes made after May 10, 1872, shall in no case *exceed three hundred feet on each side of the middle of the vein at the surface*, and that no such surface rights shall be limited by any mining regulations to less than twenty-five feet on each side of the middle of the vein at the surface, except where adverse rights existing on the 10th of May, 1872, may render such limitation necessary, the end lines of such claims to be in all cases parallel to each other. Said lateral measurements cannot extend beyond three hundred feet on *either* side of the middle of the vein at the surface, or such distance as is allowed by local laws. For example: 400 feet cannot be taken on one side and 200 feet on the other. If, however, 300 feet on each side are allowed, and by reason of prior claims but 100 feet can be taken on one side, the locator will not be restricted to less than 300 feet on the other side; and when the locator does not determine by exploration *where* the middle of the vein at the surface is, his discovery shaft must be assumed to mark such point.

6. By the foregoing it will be perceived that no lode claim located after the 10th of May, 1872, can exceed a parallelogram fifteen hundred feet in length by six hundred feet in width, but whether surface ground of that width can be taken depends upon the local regulations or State or Territorial laws in force in the several mining districts; and that no such local regulations or State or Territorial laws shall limit a vein or lode claim to less than fifteen hundred feet along the course thereof, whether the location is made by one or more persons, nor can surface rights be limited to less than fifty feet in width unless adverse claims existing on the 10th day of May, 1872, render such lateral limitation necessary.

7. The rights granted to locators under section 2322, Revised Statutes, are restricted to such locations on veins, lodes or ledges as may be "situated on the *public domain*." In applications for lode claims where the survey conflicts with the survey or location lines of a prior valid lode claim, and the ground within the conflicting surveys is excluded, the applicant not only has no right to the excluded ground, but he has no right to that portion of any vein or lode the top or apex of which lies within such excluded ground, unless his location was prior to May 10, 1872. His right to the lode claimed terminates where the lode, in its onward course or strike, intersects the exterior boundary of such excluded ground and passes within it. The end line of his survey should not, therefore, be established beyond such intersection.

8. Where, however, the lode claim for which survey is being made was located prior to the conflicting claim, and such conflict is to be excluded, in order to include all ground not so excluded, the end line of the survey may be established within the conflicting lode claim, but the line must be so run as not to extend any farther into such conflicting claim than may be necessary to make such end line parallel to the other end line and at the same time embrace the ground so held and claimed. The useless practice in such cases of extending *both* the side lines of a survey into the conflicting claim, and establishing an end line wholly within it beyond a point necessary under the rule just stated, will be discontinued.

DESCRIPTION OF CLAIM AND ACTS NECESSARY IN ORDER TO HOLD THE SAME—LOCAL RULES AND REGULATIONS.

SEC. 2324, R. S. The miners of each mining district may make regulations not in conflict with the laws of the United States, or with the laws of the State or Territory in which the district is situated, governing the location, manner of recording, amount of work necessary to hold possession of a mining claim, subject to the following requirements: The location must be distinctly marked on the ground so that its boundaries can be readily traced. All records of mining claims hereafter made shall contain the name or names of the locators, the date of the location and such a description of the claim or claims located by reference to some natural object or permanent monument as will identify the claim. On each claim located after the tenth day of May, eighteen hundred and seventy-two, and until a patent has been issued therefor, not less than one hundred dollars' worth of labor shall be performed or improvements made during each year. On all claims located prior to the tenth day of May, eighteen hundred and seventy-two, ten dollars' worth of labor shall be performed or improvements made by the tenth day of June, eighteen hundred and seventy-four, and each year thereafter, for each one hundred feet in length along the vein until a patent has been issued therefor: but where such claims are held in common, such expenditure may be made upon any one claim, and upon a failure to comply with these conditions, the claim or mine upon which such failure occurred shall be open to relocation in the same manner as if no location of the same had ever been made, provided that the original locators their heirs, assigns or legal representatives have not resumed work upon the claim after failure and before such location. Upon the failure of any one of several co-owners to contribute his proportion of the expenditures required hereby, the co-owners who have performed the labor or made the improvements may, at the expiration of the year, give such delinquent co-owner personal notice in writing or notice by publication in the newspaper published nearest the claim, for at least once a week for ninety days, and if, at the expiration of ninety days after such notice in writing or by publication such delinquent should fail or refuse to contribute his proportion of the expenditure required by this section, his interest in the claim shall become the property of his co-owners who have made the required expenditures.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That the provisions of the fifth section of the act entitled "An act to promote the development of the mining resources of the United States," passed May 10th, eighteen hundred and seventy-two, which requires expenditures of labor and improvements on claims located prior to the passage of said act, are hereby so amended that the time for the first annual expenditure on claims located prior to the passage of said act shall be extended to the first day of January, eighteen hundred and seventy-five.

That section twenty-three hundred and twenty-four of the Revised Statutes of the United States be amended by adding the following words: "*Provided*, That the period within which the work required to be done annually on all unpatented mineral claims shall commence on the first day of January succeeding the date of location of such claim, and this section shall apply to all claims located since the tenth day of May, anno Domini eighteen hundred and seventy-two."

SEC. 2327, R. S. The description of vein or lode claims, upon surveyed lands, shall designate the location of the claim with reference to the lines of the public surveys, but need not conform therewith; but where a patent shall be issued for claims upon unsurveyed lands, the surveyor-general, in extending the surveys, shall adjust the same to the boundaries of such patented claim, according to the plat or description thereof, but so as in no case to interfere with or change the location of any such patented claim.

9. Locators cannot exercise too much care in defining their locations at the outset, inasmuch as the law requires that all records of mining locations made subsequent to May 10, 1872, shall contain the name or names of the locators, the date of the location, and such a *description of the claim or claims located*, by reference to some natural object or permanent monument, as will identify the claim.

10. No lode claim shall be located until after the discovery of a vein or lode within the limits of the claim, the object of which provision is evidently to prevent the appropriation of presumed mineral ground for speculative purposes to the exclusion of *bona fide* prospectors, before sufficient work has been done to determine whether a vein or lode really exists.

11. The claimant should, therefore, prior to locating his claim, unless the vein can be traced upon the surface, sink a shaft, or run a tunnel or drift, to a sufficient depth therein to discover and develop a mineral-bearing vein, lode, or crevice; should determine, if possible, the general course of such vein in either direction from the point of discovery, by which direction he will be governed in marking the boundaries of his claim on the surface. His location notice should give the course and distance as nearly as practicable from the discovery shaft on the claim to some permanent, well-known points or objects, such, for instance, as stone monuments, blazed trees, confluence of streams, point of intersection of well-known gulches, ravines, or roads, prominent buttes, hills, etc., which may be in the immediate vicinity, and which will serve to perpetuate and fix the *locus* of the claim and render it susceptible of identification from the description thereof given in the record of locations in the district, and should be duly recorded.

12. In addition to the foregoing data, the claimant should state the names of adjoining claims, or, if none adjoin, the relative positions of the nearest claims; should drive a post or erect a monument of stones at each corner of his surface ground, and at the point of discovery or discovery shaft should fix a post, stake, or board, upon which should be designated the name of the lode, the name or names of the locators, the number of feet claimed, and in which direction from the point of discovery; it being essential that the location notice filed for record, in addition to the foregoing description, should state whether the entire claim of fifteen hundred feet is taken on one side of the point of discovery, or whether it is partly upon one partly upon the other side thereof, and in the latter case, how many feet are claimed upon each side of such discovery point.

13. The location notice must be filed for record in all respects as required by the State or Territorial laws and local rules and regulations, if there be any.

14. In order to hold the possessory title to a mining claim located prior to May 10, 1872, and for which a patent has not been issued, the law requires that *ten dollars* shall be expended annually in labor or improvements on each claim of *one hundred feet* on the course of the vein or lode until a patent shall have been issued therefor; but where a number of such claims are held in common upon the same vein or lode, the aggregate expenditure that would be necessary to hold all the claims, at the rate of ten dollars per hundred feet, may be made upon any one claim. The first annual expenditure upon claims of this class should have been performed subsequent to May 10, 1872, and prior to January 1, 1875. From and after January 1, 1875, the required amount must be expended *annually* until patent issues.

15. In order to hold the possessory right to a location made since May 10, 1872, not less than one hundred dollars' worth of labor must be performed or improvements made thereon annually until entry shall have been made. Under the provisions of the act of Congress approved January 22, 1880, the first annual expenditure becomes due and must be performed during the calendar year succeeding that in which the location was made. Expenditure made or labor performed prior to the first day of January succeeding the date of location will not be considered as a part of or applied upon the first annual expenditure required by law.

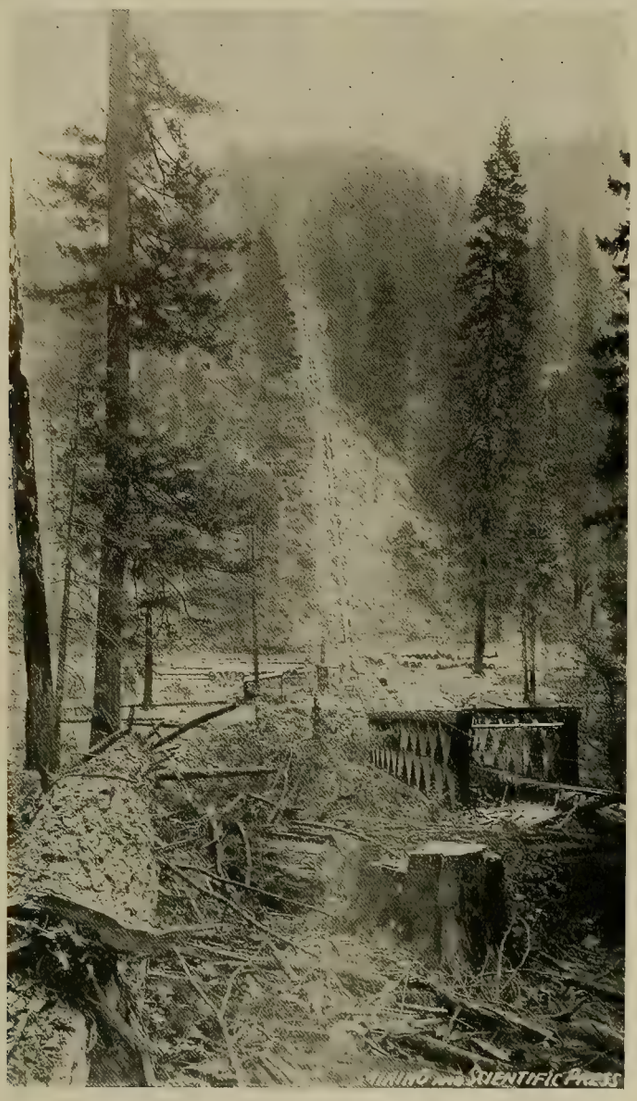
16. Failure to make the expenditure or perform the labor required upon a location made before or since May 10, 1872, will subject a claim to relocation, unless the original locator, his heirs, assigns, or legal representatives have resumed work after such failure and before relocation.

17. Annual expenditure is not required subsequent to entry, the date of issuing the patent certificate being the date contemplated by statute.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That the provisions of section numbered twenty-three hundred and twenty-four of the Revised Statutes of the United States, which require that on each claim located after the tenth day of May, eighteen hundred and seventy-two, and until patent has been issued therefor, not less than one hundred dollars' worth of labor shall be performed or improvements made during each year, be suspended for the year eighteen hundred and ninety-four, so that no mining claim which has been regularly located and recorded as required by the local laws and mining regulations shall be subject to forfeiture for non-performance of the annual assessment for the year eighteen hundred and ninety-four; *Provided*, That the claimant or claimants of any mining location, in order to secure the benefits of this act, shall cause to be recorded in the office where the location notice or certificate is filed, on or before December thirty-first, eighteen hundred and ninety-four, a notice that he or they in good faith intend to hold and work said claim: *Provided, however*, That the provisions of this act shall not apply to the State of South Dakota.

SEC. 2. That this act shall take effect from and after its passage.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That section two thousand three hundred and twenty-four of the Revised Statutes be, and the same is hereby, amended so that where a person or company has or may run a tunnel for the purpose of developing a lode or lodes, owned by said person or company, the money so expended in said tunnel shall be taken and considered as expended on said lode or lodes, whether located prior to or since the passage of said act; and such person or company shall not be required to perform work on the surface of said lode or lodes in order to hold the same as required by said act.



(To be Continued.)

A Trinity County, California, Hydraulic Enterprise.

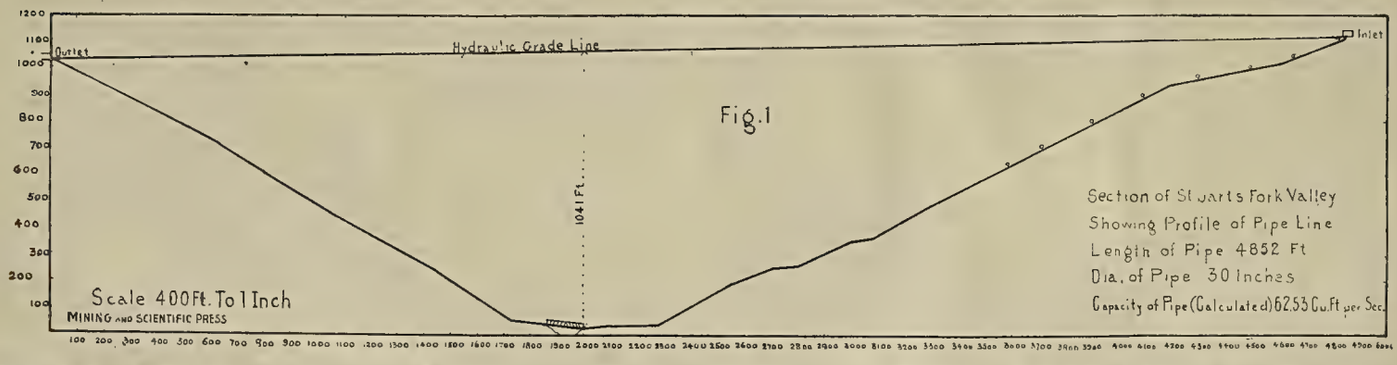
In the issue of November 27th, '97, was illustrated and described the large hydraulic enterprise of the Cie Fse des Placers Hydrauliques de Junction City, Trinity county, California, the data being mostly furnished by Mr. E. Saladin, the manager of the French company, in which considerable interest was taken, the magnitude of the enterprise eliciting comment, the size and length of the pipe being particularly noticed.

In Trinity county, as in other parts of this State, are being exhibited good examples of what may be styled the "progressive element of hydraulic mining." It is within the remembrance of many California miners when what is now being daily done in hydraulic mining in this State was considered an impossibility. Many old miners will recall when such problems as those on the Feather river were considered difficult, and what is now being done looked upon as an impossibility. We have a good deal to say about the progress in quartz mining, and justly, but it is to be noticed that hydraulic mining in this State progresses as well. This calls up remembrance of such a man as H. B. Lathrop, who many years ago was foreman for a hydraulic company on Feather river; and one day, overhearing the engineer of the company explaining to the president, who was visiting the works, that something was an "impossibility," asked the engineer: "What is it that is impossible?" The engineer explained that the desire was to bring water for the claim through a pipe which ought to be 20 inches in diameter, upon which would be a pressure of 400 vertical feet. Lathrop picked up a pitcher of water standing on the table, poured out a glassful, and said: "Was there any trouble about that?" "No," was the reply. "Well," said Lathrop, "just make that glass 400 feet high, and you can still fill it just the same, if the glass is strong enough." "That's just it," said the engineer; "you can't make a pipe of that size, nor make it strong enough." "But I can, and will," said Lathrop. He took a pencil and began figuring what the pressure would be, and finally decided that an 18-inch pipe would do. "But," the engineer said, "an 18-inch pipe is out of the question." Finally the president told Lathrop to go ahead and get his 18-inch pipe. In those days he had some little difficulty; but he had the pipe built and put in just as he wanted it, and it worked all right. Neither Lathrop nor anyone connected with the work those days thought that the time would come when up in Trinity county would be built, as the French company has done, an eleven-mile ditch and 5700 feet of pipe put in, of which 2200 feet is 30-inch pipe and 3400 feet is 36-inch pipe.

The purport, however, of this present article is to illustrate another large hydraulic enterprise in Trinity county, namely, that of the La Grange Hydraulic Gold Mining Company, of which Mr. Wm. H. Radford of Weaverville is the superintendent. Through the courtesy of Mr. Radford the MINING AND SCIENTIFIC PRESS has received profiles, sketches

STUART'S FORK PIPE LINE, LOOKING NORTH.

STUART'S FORK PIPE LINE, LOOKING SOUTH.



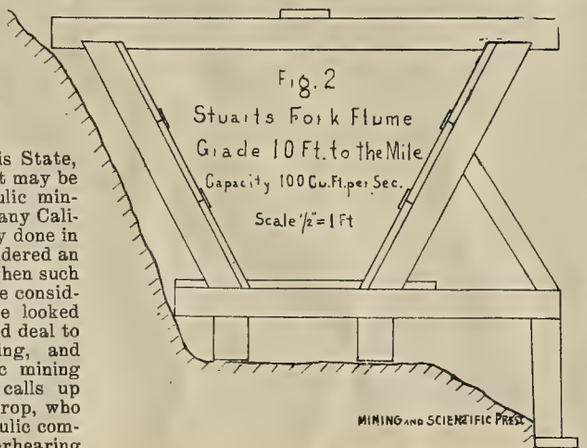


Fig. 1

and figures, from which the accompanying are engraved; and he has also supplied some data of interest to hydraulic miners everywhere.

Fig. 1 on this page shows a profile of the inverted syphon lately put in by the La Grange Hydraulic Gold Mining Company, forming a part of its main water system, which, when completed, will convey the water of Stuart's Fork and Rush creek to its mines on Oregon Gulch mountain and Morris hill in Trinity county. The pipe is 30 inches in diameter, is made of the best steel and was tarred and tested before being put in place. It is well anchored at all the angles and is buried for a greater part of its length in a trench which averages about 3 feet in depth and 3 feet in width. There are eight 3-inch air valves on the inlet side and five manholes at points about 1000 feet apart. The air valves are of the ball pattern, the balls being made of gutta percha, and are of such a density that they will just float in water. Expansion joints are provided at each end of the pipe and are situated just below the inlet and outlet pieces. The inlet piece is bell-shaped, 4 inches in diameter at the upper end and tapers gradually to 30 inches. It receives the water from the bottom of the head box and is curved at the smaller end to come into line with the pipe on the hillside. The outlet piece is in the shape of a bonnet, 4 feet in diameter at the upper end and discharges the water into the vertical end of the outlet box.

At the lowest point of the syphon the pipe is provided with a 4-inch gate valve, which serves as a blow-off cock in case it is necessary to at any time empty the pipe. This valve is opened and closed by means of bevel gearing, to insure a very slow motion. The pipe crosses Stuart's Fork on a wooden bridge of the Howe truss pattern, 12 feet in width and 138 feet long. So far only about 600 inches of water have been turned through the pipe in order to furnish power for the air compressor used in connection with the driving of the tunnel that is to connect the Stuart's Fork section with the Rush creek section. This amount issues from the pipe perfectly smoothly and without exhibiting any bubbles, fluctuations or the milky appearance usually to be seen at the discharge end of inverted syphons.

Fig. 2 shows a vertical section of the flume used to convey the water from the head of the pipe line and from the pipe line to the tunnel. This shape was adopted to suit the generally steep character of the country over which it had to pass, and to obviate making too wide a flume bed in ground which requires but little to start it sliding. With this style of flume a bed only 4 feet wide was necessary. The flume, lying snugly under the bank, is to some extent protected from snowslides. There are 584 feet of lumber in each 12-foot box of flume, and as many as forty boxes were laid in a day, working from one end. As fast as the bottom and lower sideboards were laid more lumber was floated down from the head and the flume extended. The flume passes over some very rough, rocky country, necessitating a great deal of blasting. Where ravines subject to snowslides were encountered the flume was sunk in the rock or soil, so that it could not be swept out. With the completion of the long tunnel now being driven the main water system will consist of 23.85 miles of flume and ditch, three inverted syphons, aggregating 8754 feet in length, and eight tunnels, aggregating 11,134 feet, making a total length of 27.61 miles and forming one of the most extensive and picturesque mining ditches in California.

The La Grange Hydraulic Gold Mining Company's property embraces an area of 3174 acres and was bought five years ago by F. Beaudry and Baron La Grange of France.

The canal from Rush creek, 14½ miles, has five tunnels, aggregating 2118 feet in length. These tunnels have a grade of ¾ to 1 inch to the rod, and some of them are heavily timbered almost their entire length, while about seven-eighths of the ditch is in rock. These water courses are 7 feet on top, 4½ at the bottom, 4 deep, grade 14½ feet to the mile, and carry 3000 miners' inches, or 60 cubic feet, per second.

The main canal is 14½ miles in length, with a capacity of 4000 inches; upper Loveridge ditch, 4 miles, capacity 1500 inches; lower Loveridge ditch, 1¾ miles, capacity 600 inches, with five or six of minor importance, making the aggregate about 23 miles, with capacity of 7000 inches. The waters are taken from Rush, West Weaver and other creeks.

To increase the volume of water, Rush creek and Stuart's Fork are being connected by tunnel through the mountain, 9000 feet in length, 5x7 feet diameter, passing under the comb of the mountain at a depth of over 3000 feet.

At the top of Table mountain a large reservoir is supplied by the canal system, from which pipes radiate to the various giants, 15, 18 and 22 inches in diameter, and under various heads. The mine is equipped with a top sluice 108 feet in length, 6 feet wide, 3 deep, with a grade of 8 inches to 12 feet, paved with block riffles 16x16½, 11x13, 13x13, followed by ground sluices 100 feet long. Still below are forty-three boxes, 12 feet each, paved with block and stone riffles. At the end of the main sluice is a chute with right and left undercurrent, one 18x38, the other 24x46, paved with rock riffles. Grade of upper sluice is 8 to 12 inches to the box of 12 feet. The larger intervening boulders are handled by derrick. Electric plant, telephone and telegraph systems and other improved features are in the equipment. The tailings are dumped into Oregon gulch, which discharges into Trinity river above Junction City, and in that region there is no vexatious question of debris.

The two views on the opposite page show the line of flume and the pipe line, and will give some idea of the work. They are engraved from photographs taken especially to illustrate this article.

In connection with this it is to be noted that such work presents some engineering problems that must be satisfactorily solved as the work progresses; a hoisting machine, a trolley cable, power, etc., are necessary to handle such large pipe, each 48-foot section of which will weigh 340 pounds.

Beginning with the issue of Nov. 27th, '97, has appeared a series of articles on practical hydraulic mining, of which the above is the close, the first and last illustrating the latest and largest enterprises in the northern part of California.

The Bromine Extraction Process.

The following particulars of the above-mentioned process are furnished by H. F. Brown to E. D. Peters: In response to your request for information in regard to the "bromine process" of gold extraction, as carried out at the Nellie Bly mill at Boulder, Colorado, I take great pleasure in submitting the following statement, which I think will be sufficiently in detail for you to gather the general idea that forms the distinctive features of the "bromine process." My knowledge of the practical workings of the process begins with the erection of the Nellie Bly mill, which was built as an experimental plant, after drawings made by me. The mill consists of the usual appliances for fine crushing with Cornish rolls, a roasting furnace, mechanical cooling-hearth, etc., arranged practically as in an ordinary dry-crushing mill for chlorination. In addition to the barrels were solution tanks, tanks for precipitation, and columns for recovering the bromine. The Boulder ores, as you are well aware, present some difficult metallurgical problems that have proved hard to solve. The presence of tellurium renders amalgamation impossible, and no efforts at concentration have proved successful, and the ordinary barrel chlorination and cyanide gave but meager results. The richer tellurides were sold to the smelters, but the mass of the low-grade ores were practically worthless. Owing to these combined difficulties, I took more than an ordinary interest in the bromine experiment, while at the same time I thought that the experiment should be made where conditions were more favorable.

The process, in brief, is as follows: The ore is first crushed to pass a 30-mesh screen, and is then roasted "sweet." Owing to the excess of tellurium, the roasting problem was a matter of serious concern, but after full investigation it was decided that the Brown horseshoe type of mechanical roasters was best adapted for the purpose. The requirements were deemed to be frequent stirring, with a length of hearth that would insure very gradual heating of the charge, with a high heat at the finish. The process of roasting has proved a success, there being but a very trifling gold loss perceptible, after a most careful analysis, covering actual work for about one year. From the roaster the ore is carried over the Brown mechanical cooling and conveying hearth, and automatically discharged to the storebin above the barrel. The barrel is first charged with the required amount of 2 per cent solution of bromine, after which the ore charge is put in, and the barrel closed and revolved for about one hour and a half. The length of time the barrel is revolved depends largely on the fineness of the mineral, and varies from one to two hours. The solution is then forced out through the usual filter and into a storetank in the top of the mill. Up to this point the operation is exactly similar to the chlorine process. The distinctive characteristics of the bromine process consist in the recovery of the bromine and the refining of the gold. There are two tanks in the top of the mill, one for the strong solution, and the other for the solution weakened by the wash-water. Beneath each tank is a tower made of porcelain pipe about 12 in. in diameter and 20 ft. high. The column connected with the strong solution tank is filled with diaphragms placed a few inches apart, and pierced with small holes. These holes are staggered, so as to break the stream of solution as it flows through as much as possible. The column connected with the weak solution tank is filled with broken stone. The two columns are connected together at the top by means of a pipe, and at the bottom the strong solution connects with a precipitating tank, while the other connects with a store tank. Live steam is admitted to the bottom of the strong solution column and the solution admitted at the top. The small, broken streams of solution are quickly heated considerably above the boiling point, usually about 300 degrees Fahr. This releases all the uncombined bromine, which is carried over to the opposite column through the pipe at the top, in the form of gas or vapor. Weak solution is admitted in a quantity just sufficient to condense the vapors and to produce a 2 per cent solution, which goes to the store tank ready for the next charge.

This process of recovering the free bromine is very simple and requires but little attention, the attendant quickly learning to determine the strength of the solution that passes to the store tank by the color. The precipitation of the gold from the solution is accomplished by introducing finely ground sulphide of iron, and the precipitate is passed through a Johnson filter press to free it from excess of moisture, after which it is placed in stone tanks and redissolved by a bromine solution. After settling, the solution is syphoned off to another stone jar or tank, and nothing but pure bromide of gold passes over. This operation is repeated until tests show that no more gold is being passed. The pure gold solution is again treated with a little sulphide of iron, and the gold precipitated. This precipitate is then dried and melted, yielding a bar of C. P. gold.

This method of refining the precipitate is exceedingly simple; it requires but little attention, and there are no impurities to form slag, reducing the bulk to so small a limit that it is easily handled even in a large mill. The material left in the first tank after syphoning off the gold consists of silicious matter, tellurium, bromo-sulphur compounds, etc. The bromine from all these compounds is liberated by washing with a small amount of chlorine, making a complete recovery within a very small percentage of all the bromine. About all the loss that is sustained in the whole operation is the exceedingly small amount of chloride of lime and acid to form chlorine gas sufficient to free the combined bromine, amounting probably to less than 1 per cent of the loss when chlorine is used instead of bromine, as in barrel chlorination. The above is a description of the process as first used, but subsequent improvements have simplified the process, especially as to the mechanical appliances, so much as to revolutionize the whole mechanical arrangement. The chief objection to bromine is the exceedingly pungent fume, necessitating the employment of closed vessels during the whole operation, causing great expense in shipping and handling. The improvement developed during the past year consists of a process of changing the bromine to an odorless alkaline salt which can be shipped in sacks or boxes with no more risk or expense than shipping common salt, and without loss by volatilization. This bromo-salt forms odorless solutions that can be used in an ordinary open leaching tank, the same as cyan- or hypo-solutions, and retains all the remarkable properties of a gold solvent belonging to bromine as usually used. The recovery of the bromine from the alkaline solutions is virtually as described above. You will readily understand the advantages of being able to use the solutions in open tanks without loss or discomfort, as well as the great saving in first cost of a plant and the saving in power.

I suppose there are ores where the gold would be too coarse for profitable treatment by bromine, as, like all solvents, it works comparatively slow on coarse particles of gold. Should there be some coarse gold in the ore that would require too much time to become completely dissolved, the tailings can be run over silvered plates and a complete recovery made, as gold coated with bromine is very susceptible to the action of quicksilver. Where the alkaline bromo solution is used this can be done without any discomfort, as there is no odor as would be in the case of chlorine. Bromine solutions act but slowly on silver, a bromide coating quickly forming that arrests solvent action, but a bromide of silver is easily amalgamated, and I believe that the silver in mixed ores can be recovered very successfully by amalgamating the tailings, and with but a trifling expense. This is, however, but a theory, as I have not made or seen any tests to determine this point, there being no silver in the ores that are being worked in the Nellie Bly mill.

As to the necessity of roasting, I believe it is as much for the purpose of calcining the clays associated with the ores to destroy their cohesive qualities as for the purpose of eliminating the sulphur, but at least there is no more necessity of roasting than there is with cyanide or chlorine.

The use of mechanically stirred reverberatory furnaces has reduced the expense of calcining ores to so low a figure that it is no longer a question to be considered, the advantages of rapid percolation more than overcoming the small cost of calcining, and the increased extraction adding largely to the percentage of profits.

With the development of the alkaline bromo-salt it has become possible to adapt the bromine process to existing plants where open leaching tanks are used, the only expense required being to put up the necessary means of recovery, which would be but trifling.

Having assisted in designing and building the experimental mill, which has a capacity of twenty-five tons per day, I have had a great interest in the outcome, and during my frequent visits to the mill I have taken pains to examine the records of extraction, and to get posted with all the conditions pro

and con affecting the practical working of the process, and am free to say that I am charmed with its simplicity and effectiveness, and its apparent adaptability to all low-grade gold ores.

The records of regular mill work, covering several months and several hundred tons, show a saving on the difficult ores of Boulder county that will average up with the record of the best mills which I know, working much less complex ores, and under more favorable conditions.

The development of the alkaline bromine solution, and its proved efficiency, has removed all the objections I could find against the bromine process.

The process has been developed by the joint skill and efforts of Mr. Harry Cassel and Mr. Bertrand C. Hinman.

The Witwatersrand Banket, With Notes on Other Gold-Bearing Pudding Stones.*

NUMBER V.

By GEO. F. BECKER.

Associated with the dikes, and manifestly connected with them genetically, are numerous quartz seams. These cut the country as irregularly as the dikes. As a rule they show neither gold nor sulphurets, but sometimes masses of pyrrhotite and a little pyrite are found in them, and in a few cases pockets of gold have been encountered, particularly, it is said, at their intersection with the reefs. It is possible that this last conclusion is an erroneous one, for the white veins nowhere contain gold so distributed as to form workable ore in considerable quantities, and it is only where they cross drifts or stopes that they are broken down. There is no way of ascertaining just how much gold has come from the pockets in the white quartz, but opinions among the managers seem agreed that it does not exceed a few thousand pounds in value. With this exception all of the gold of the Witwatersrand occurs in the banket reefs, of which by no means all carry gold in remunerative quantities.

Composition of Banket.—The banket is a highly siliceous mass, consisting of quartz pebbles embedded in a matrix composed of sand, pyrite and other minerals, all cemented by secondary silica. The large quartz pebbles have all the characteristics of vein quartz, but show under the microscope undulous extinctions and other evidences of dynamic action to which they have been subjected. They are frequently cracked, and then sometimes show veinlets along the fractures. The quartz pebbles often carry pyrite and other sulphurets, as zinc blende and galena. This was recognized by Dr. A. Koch, who states that pyrite occurs as inclusions in the quartz pebbles of almost all the conglomerates. So, too, Mr. A. Pelikan states that in the suite of specimens which he has examined pyrite is found as inclusions in the quartz pebbles. Mr. De Launay denies this occurrence. Gold and pyrite, he says, exist exclusively in the cement, never in the pebbles. In the Crown Reef mine I found more than a dozen instances of the inclusion of sulphurets in the course of a brief search, and I observed a great number of such cases in other mines on subsequent occasions. These were cases in which the sulphurets were disseminated through the quartz of the pebbles, not arranged on surfaces which might be interpreted as recemented cracks. Under the microscope I find many cases of the inclusion of disseminated pyrite in pebbles of what is plainly vein quartz. Some of the sulphuret-bearing pebbles are auriferous. One such which I collected in the Crown Reef was large enough to bear trimming, so that the outer surface could be entirely removed. The residual kernel was assayed by Mr. A. F. Crosse and found to contain gold in appreciable quantities. Prof. Le Neve Foster states that assays by Mr. Richard Smith show some of the pebbles to be auriferous. The question whether free gold exists in the pebbles has been much discussed, and has been treated as if it were a matter of the first importance in determining the nature of the gold deposits. This is quite a mistake, as I shall explain somewhat later. I was assured that free gold has repeatedly been observed in the pebbles with the naked eye, but I did not succeed in getting a sight of any such specimen. Mr. Pelikan, however, has found moss gold embedded in the quartz of his specimens, and has photographed the occurrence of gold embedded in quartz under the microscope. These photographs are published in Mr. Goldmann's work, with different tints for pyrite of gold. I possess a slide of Ferreira ore which shows gold solidly embedded in a quartz pebble.

The matrix of the banket contains most of the gold and pyrite. Some of the pyrite in the matrix is said to be in well-defined, sharp crystals, but much more of it is in the form of rolled pebbles. In some of the ores of the district it is evident to the naked eye that pyrite pebbles exist, but in most cases a thin section is needed to display them. Dr. Koch says that the grains of pyrite are generally shaped by attrition, or at least display rounding of the edges and corners. This is confirmed by Mr. Pelikan. Mr. De Launay also calls especial attention to the fact that the pyrite often occurs in grains which are rolled, or at least broken, blunted or rounded. He finds such pyrite pebbles extremely prevalent both in the Main Reef series and elsewhere. He considers the pyrite pebbles as auriferous, and mentions having observed under the microscope gold embedded in pyrite, without stating whether in these particular instances the pyrite was rounded or not. In some of the specimens which I have examined the pyrite is substantially all in the form of well-rounded pebbles, isolated from one another by sand and secondary minerals. No one who has seen such specimens would admit for a moment either that the pyrite was not rolled or that it was fractured by movement in the rocks during upheaval. The pebbles have been worn round, and the detritus has been removed. In several cases they are externally converted into a brownish-black mineral, which is probably hematite, and the conversion must have taken place before the upheaval of the banket, for the specimens are blue and fresh. The pyrite pebbles measure, on the average, one-tenth of a millimeter in diameter. In some specimens the pyrites are densely crowded into layers and the pebbly character is less apparent. Some recrystallization may have gone on in these cases, but I did not succeed in finding the well-defined crystal outlines usual in embedded sulphurets. The pyrite pebbles in many cases contain numerous scattered particles of gold, which may be seen by very strong incident light. I have observed this both in my own slides and in Mr. Johns' suite.

* Eighteenth Annual Report Mineral Resources of the United States.

A Correction of Misleading Statements.

TO THE EDITOR:—A copy of the prospectus of the "Great Northern Industrial Gold Company, Limited (California)," of London, has just been handed to me. The mines it proposed to purchase are in Plumas county, this State, about seven miles northwesterly from Spanish Ranch. The proposed capitalization is £400,000, in shares of £1 each. Of this, £116,000 in shares go to the mine owners (?), £164,000 in cash go to the mine owners (?), £70,000 in shares to be sold for a working capital, and £50,000 shares to be held in reserve for the present.

No one acquainted with the property would for a moment think of placing a higher value upon it than a small fraction of the proposed purchase price of $1,400,000. I consider it the duty of every honorable man interested in the welfare of California to correct gross misrepresentations of mining property, and I desire to present some facts in relation to this property, as I have been referred to in the prospectus in the following language: "Mr. J. J. Crawford the Official State Mineralogist, also visited the mines and took thirty-eight sacks of ore from different parts, which he sent for assay to Mr. L. E. Falkenau, the Official State Assayer. The results gave an average of about one ounce of gold per ton as per his certificate received."

In August, 1895, I was engaged by C. E. Ertz (named as "Director at the Mines" in this prospectus) to examine the mining claims in Plumas county mentioned in this prospectus as a mining engineer, and *not* as State Mineralogist. I spent five days there and without any trusted assistants. My report was so unsatisfactory to Mr. Ertz that he returned it to me with a substitute, which he had the effrontery to ask me to sign as my individual report, and also as State Mineralogist. This I refused to do; he left them both and departed in high dudgeon. I did bring away thirty-eight sacks of ore, *including two of rich ore selected by the owners*, and had them assayed by Mr. Falkenau, who *is not the "official State assayer,"* nor is any one else. I was suspicious that my samples might have been tampered with, and directed Mr. Falkenau to separate the fine from the coarse stuff before assaying the latter. The milling tests which he made, with the two samples selected by the owners left out, were as follows: From the hill claims, $1.65 in free gold, and 54 cents in the concentrates; from the flat claims, $2.84 in free gold, and $1.48 in the concentrates.

At the urgent and repeated solicitations of Mr. Ertz, I directed Mr. Falkenau to remix the fine with the coarse stuff and assay it. His return—the one referred to by Ertz in the prospectus—showed the *average* of the assays was: From samples Nos. 1 to 24, inclusive, $27.28 per ton; from samples Nos. 25 to 38, inclusive, $8.26 per ton. The *average* of the assays of the *coarse* stuff was: From samples Nos. 1 to 24, inclusive, $1 89 gold per ton; from samples Nos. 25 to 38, inclusive, $3.89 gold per ton.

The comparison between the two sets of assays is interesting and instructive.

Some few years ago Mr. Jas. E. Mills, M. E., late of Quincy, Plumas Co., and of Boston, Mass., bonded the hill claims for some Eastern parties, erected a 5-stamp prospecting mill and made extensive developments. He milled over 600 tons which did not average $1.50 per ton. All reference to it is omitted in the prospectus. Mr. Henry Janin made an exhaustive examination a few months before I did, but no mention is made of his report. I also understand that J. B. Low of this city reported adversely upon the same property.

J. J. CRAWFORD, Ex-State Mineralogist.

San Francisco, Feb. 16th, '98.

Geology of the Yukon.*

NUMBER IV.

It is important in the consideration of sluices that the grade be accurately adjusted to the force of the current which flows through it, and to the length of the box. If the grade of the sluice is too small, there is a constant tendency to clog, and the accumulated gold will be associated with a very large proportion of valueless dirt, while, if the grade is too great, much valuable material may be carried off at the end of the boxes and deposited as refuse or "tailings." As an example of this latter mistake, it may be mentioned that the tailings which have been accumulated by one miner are often successfully rewashed by another.

The labor of removing the barren gravel which overlies the pay dirt is very great, and, ordinarily, this is undertaken when the thickness is not considerable. With increasing thickness the point is soon reached where the task of removing becomes so formidable that the miner will not attempt it unless he believes that there is rich pay dirt beneath. In this event, the practice is adopted of sinking shafts through the barren material to the pay dirt, and by extracting this pay dirt by means of tunnels or drifts along the surface of the bedrock. This method of working has been only lately adopted, but promises to be very important. The ordinary methods of sinking, drifting, timbering, stoping, etc., have been peculiarly modified in the Forty Mile district on account of the exceptional character of the climate, and these modifications have spread from this district over the rest of the gold diggings. Owing to the severity of the long winters, the gravels are frozen during seven or eight months of the year. The miner who desires to sink a shaft waits until the cold season arrives and then sinks through the frozen gravel, which is so firm that the shafts or drifts do not need timbering for the sake of support. In sinking or drifting, instead of employing powder and pick, as elsewhere, a small fire is built at the bottom of the shaft which is being sunk, or at the face of the drift which is being run, and thus the gravels are thawed out for some distance, and can be usually shoveled up and taken to the surface. It takes a surprisingly little amount of wood to run a drift through the frozen gravel for a long distance. In this way the pay dirt is extracted and accumulates on the surface until spring, when it is shoveled into sluices and the gold is separated by washing, panning, blowing and amalgamating, in the manner previously described. One large lump or "stope" thus excavated in the gravels of Miller creek, in the Forty Mile district, is said to have measured 64x32 feet and 19 feet in height, with only 8 feet of barren gravel between it and the surface; and yet this stood firmly until spring, when the gravels thawed and the stope caved in.

The fundamental rock of the region is a schistose granite, and lying upon this is a thick series of schistose and often impure quartzite, whose situation and petrographical characters indicate a probable derivation from the granite. The schists are also graphic in places, suggesting the presence of organic life at this period. Lying upon these quartzite schists, which have been called the Birch creek series, come thick beds of crystalline marble, interbedded with quartzite schists having much the same characters as before, but grading into more highly crystalline hornblende and mica schists are often graphitic, and are often derived from impure sediments. Above this series of marbles, schistose quartzites, and hornblende and mica schists, which have been called the Forty Mile series, comes a great thickness of basic volcanic rocks, alternating with tuffs and impure sediments. This has been called the Rampart series. While the Birch creek and Forty Mile series are highly schistose, the Rampart series is, on the whole, massive, although generally joined and locally becoming schistose along definite zones. On the whole, however, there is a marked contrast in degree of metamorphism between this and the preceding formations. In the Forty Mile and Birch creek series are some dioritic and granitic dikes which have been greatly sheared along with the enclosing rocks; and there are quartz veins which are generally parallel to the schistosity, and which also have suffered great shearing. Besides the greatly sheared dikes, there are others which show less and less metamorphism, and finally some which have been entirely unaffected by any dynamic disturbance. The massive dikes, which occur in close proximity to the more or less schistose ones, invariably show themselves to be the youngest of the series. These same youngest dikes, or dikes of the same peculiar type, are also found cutting the rocks of the Rampart series.

Above the volcanic rocks and impure sediment of the Rampart series come limestones, shales, and occasional conglomerates, which, from want of knowledge sufficient for their differentiation, have been grouped together as the Tahkandit series. This series contains in different parts fossils, which indicate that it is in part Carboniferous and in part Devonian; but these are not necessarily the limits of the age of the rocks included under this classification.

(*To be Continued.*)

Automatic Oilers.

It is only recently that the oiling of steam engines and other constantly running machinery has begun to be automatic. It was a long time before oil was looked upon as anything more than a saving device to keep things going comfortably, and many even now have not got so far along as to recognize oil as a necessary part of the actual running machine.

The only thing that for years was done by the builder towards the oiling of the machine or engine that he built was the drilling of a few oil holes, and these were often forgotten, though it would have been impossible to keep running without the oil. The engineer had to oil the different parts of the engine, with more or less regularity, just as much as originally he had to work the valve to let the steam into the cylinder and then another valve to to let it out again. The latter operations had to be done several times a minute, and were therefore irksome, and were soon evaded by a little ingenuity; the oiling might occur only once an hour, or even less frequently, so that the pressure on the engineer was not sufficient to make oiling automatic. Probably some could have been found in the olden times who would have suggested that the automatic oiling would make the engineer careless; so the same argument at one time or another has been used against both the automatic feed and the automatic feed stop. It was certainly many years before anything was done toward making the oiling of steam engines automatic. The proper emblem for the engineer, as most typical of his occupation, was an oil can. When a builder set up and started a new steam engine he would sometimes furnish a tray, with a handsome assortment of oil cans of different sizes and shapes, with different lengths and different crooks to the spouts.

Sight feed oilers have lately come into general use, as a necessity that has been forced by the constant running at high speed and the inaccessibility of many parts while in motion. This is at best only a semi-automatic arrangement. The engineer's emblem now has only become a big oil can or filler for the cups instead of the old squirt can. A row of engines and dynamos in some metropolitan department stores is so placed that all the visitors to the establishment may see and admire the collection of machinery; but there is a great number of oil cups to be washed and filled and kept adjusted, and one cannot but wonder why the oil, being a constant necessity everywhere, could not be distributed throughout just as the steam was distributed. Why, in fact, could not the oiling be made perfectly automatic?

The contrast to this is the engine room of a manufacturing concern with a completely automatic oiling system. There are in the engine room two horizontal engines, three or four dynamos and a steam pump, and wherever oil is needed on anything there is a pipe leading to it. All the pipes are connected to and receive oil from a vertical oil tank placed against the side of the engine room. This tank is large enough to hold over a barrel of oil. The oil is taken by the pipes from the top of the tank, and leading to the various sight feed oilers, they are all and always subject to the same pressure, so that when they are once adjusted to the required feed they need no more attention. The pressure is applied to the oil by means of water flowing in at the bottom of the tank, and a glass tube on the side always shows the level of the oil, or, rather of the water under the oil.

The device employed is a water tank located a couple of feet higher than the top of the oil tank, with a float in it, which keeps the water constantly at about the same level. This gives a gentle and sufficient pressure to the oil, and one that does not vary. Means are provided for draining the oil from the engines and returning it to a tank, where it can be filtered and used again, either in engine room or in some other place in the shop. This arrangement indicates in its completeness the post-automatic stage, or the perfected stage, of lubrication.

Electrical Storms in California.

The electric storms of California are not local to any one portion of the State over another; thunderstorms are observed as occurring on the same day over 800 miles apart, viz: at Pichacho, San Diego county, in the southeastern portion of the State, and Yreka, Siskiyou county, in the northern portion of the State.

During the thunderstorms of August 10, 1896, electric displays were observed in Siskiyou, Modoc, Lassen, Tehama, Sonoma, Alameda, Santa Clara, Mono, San Bernardino and San Diego counties. Siskiyou and San Diego counties are nearly 800 miles apart.

The greater number of thunderstorms in June, July and August are confined to the counties of the Coast Range and the Sierra Nevada range of mountains. Daily during these months the tops of cumulo-stratus and cumulo-nimbus clouds may be observed over the Sierra Nevada range of mountains, especially in the northeastern and eastern portions of the horizon.

The greater number of these storms are noted in July and August, during and at the close of a hot spell in the Sacramento and San Joaquin valleys. As the hot and moist-laden air rises it strikes the upper southwesterly current of air and is wafted over the Sierra Nevada mountains, where the moisture is rapidly condensed, forming these thunder-head clouds. It is among such clouds as these that so much sheet lightning is observed and reported by observers in the foothill and valley towns.

Herewith is a record of all electric storms reported by the voluntary observers throughout the State from September, 1891, to October, 1897, inclusive:

Total number of thunderstorms recorded as having occurred in the State of California from September, 1891, to October, 1897:

YEAR.	1891.....	1892.....	1893.....	1894.....	1895.....	1896.....	1897.....	Total.....	Monthly averages
January	..	0	1	6	5	7	6	25	4
February	..	2	0	0	1	4	8	15	3
March	..	9	4	2	3	3	7	28	5
April	..	3	2	4	5	9	5	28	5
May	..	4	7	6	4	13	10	44	7
June	..	6	0	9	5	11	15	46	8
July	..	8	8	12	3	25	4	60	10
August	..	2	0	15	6	18	17	58	10
September	2	8	6	2	7	12	15	51	7
October	1	9	0	1	10	4	5	30	4
November	0	7	3	1	0	0	....	11	2
December	2	1	6	4	3	1	....	17	3
Total	..	*5	59	37	62	52	107	†91	413	88

NOTE.—Total and average for September and October are for seven years. *For four months. †For ten months.

The greater number of these storms are reported as occurring during the months of May, June, July, August and September; the hotter the weather in summer the greater are the number of such storms observed and reported. The records of 1896 and 1867 show a greater number recorded. Possibly this is due partly to an increased number of observers and to more accurate records of those storms than during previous years, when a much smaller number was reported.

During cool summers there are much fewer electrical displays than during hot summers with long-continued spells of excessive heat. No doubt, if our summers in California were as wet and stormy as in the States east of the Rocky mountains, our record of magnificent electric displays would be equal to those of the East.

THE Geological Survey has prepared a tabulated statement showing the steady increase in the production of spelter in the United States from 1882 to 1897. The total production in short tons for 1882 was 33,765, in 1892 it was 87,260 and in 1897 it had reached 99,980 tons.

THE Merced Falls, Cal., Electric Power Co. has incorporated at Merced; capital stock, $100,000; J. G. Ruddle, Snelling; E. D. N. Lehe, Stockton; J. T. Peck, J. D. Bradley, Merced; C. E. Green, San Francisco.

Coast Industrial Notes.

—Already about $13,000,000 Australian gold has come to San Francisco this season. The Oceanic Steamship Co's. steamer Moana, which sailed from Sydney on the 15th inst., carries an additional £900,000—$1,500,000.

—The Nevada City, Cal., board of trustees want proposals for building a reservoir, trenching and refilling of necessary trenches, and furnishing 800 feet 15-inch pipe, 2650 feet 12-inch pipe, 5200 feet 10-inch, 5000 feet 8-inch, 17,000 feet 6-inch, 5000 feet 4-inch, forty-two single hydrants, fourteen double hydrants and forty gates.

—It is proposed that power from the Blue Lakes, Cal., electric plant is to be conveyed to San Francisco, a distance of 140 miles. The Boards of Supervisers of San Joaquin, Calaveras, Contra Costa and Alameda counties will be asked for franchises to erect poles along the county roads to carry the wires which will convey the power. The proposed line passes through Bellota, Linden, skirts Stockton, crosses the reclamation districts, touches Antioch and Martinez, and reaches San Francisco by cable under the bay.

—The bids for the construction work for San Pedro, Cal., harbor numbered eighteen. The lowest bid was that of Heldmeyer & New, of Chicago; they offered to do the work for $1,685,219 99. The highest bid was that of the National Construction Co., of New York, $4,595,115. The breakwater is to be about 8500 feet long, and will contain 2,069,623 tons of stone in the substructure and 221,025 in the superstructure. The contractor will be required to commence the work in thirty days after he is notified that the funds are on hand for the purpose.

—Coal mining industry in the State of Washington is active. The general activity in manufacturing and the increased traffic of railroads and steamers have enlarged the home market. The California market has also greatly improved, the shipments from Puget sound ports in 1897 having been 506,380 tons, as against 384,842 tons in 1896. The total production of the year was 1,826,224 tons, an increase of about 250,000 tons over the previous year. The number of men employed was 3698, an increase of 200 to 250 in the year. The demand has so increased, especially since the Alaska movement began, that all the old mines are being operated to their full capacity, the idle mines have been put in operation and several new ones are being opened. A new 600-foot drift has been driven at Newcastle, which is making a practically new mine of that property and a new drift 3000 feet long is being driven from Coal creek, which will crosscut all the Newcastle veins. A new property is being opened near Carbonado with a 100-foot tunnel, which cuts five or six veins of coking coal.

—The following circular from the Treasury Department is of interest: The department is advised by Canadian authorities that small American river steamers may be carried in sections from Dyea or the Stickeen river to the headwaters of the Yukon river, to be assembled there, free of Canadian customs duty, and may carry cargo and passengers from customs stations at those headwaters to Circle City and other places in Alaska. Such steamers cannot engage in the coasting trade from any place to another in Canadian territory. The stations to be occupied by Canadian customs officers at the headwaters of the Yukon are not fully determined, and their establishment will, to some extent, be contingent on the business to be done. Parties sending such steamers across to the Yukon can, however, be advised more definitely on applying to the Customs Department of Canada, at Ottawa, and given specific information as to the points of departure, etc., on the headwaters of the river. In navigating the Yukon river in Canada the usual Canadian customs regulations are to be observed. These permit only vessels of British registry to carry passengers and cargo from one place in Canada and land the same at another place in Canada. If the river steamers transported into the Yukon have American registers they may clear with passengers and cargo from a customs station on the Yukon in Canada for ports in Alaska, and vice versa. In cases of emergency, pending the receipt of registry, a clearance may, however, be granted to any of these steamers without certificate of registry on board for the first voyage down the Yukon to Alaska, but not for a subsequent voyage.

Recent California Mining Incorporations.

Lincoln G M. D. Co., Sutter Creek, Cal.; capital stock $1,150,000, subscribed $150,000; T. J. Clavering, F. F. Thomas, C. R. Downs, F. A. Voorheis, E. C. Voorheis.

El Pororrir M. & D. Co., San Francisco; capital stock $100,000, subscribed $25; E. L. Snell, A. Greth, O. M. Tupper, C. W. Marlatt, G. T. Smith.

The Badger G. M & M. Co., San Francisco; capital stock, $300,000; $25 subscribed; S. K. Bradford, E. Duden, H. W. Mathews, A. B. Bennusen, A. V. Stevenson.

Recently Declared Mining Dividends.

Mercur, Utah, 18 cents per share, $36,000; payable Feb. 20.

Elkton, Colorado, 2 cents per share, $20,000; payable Feb. 21.

N. Y. & Honduras M. Co., Mexico, 10c per share, $15,000; payable March 5.

Anchoria-Leland M. & M. Co., Colorado, 1 cent per share; Feb. 15.

Elkton Con. M & M. Co., Colorado, 2 cents per share, $20,000; payable Feb. 20.

Personal.

P. KERWIN of Virginia City is in San Francisco.

M. DOWNEY is the new Supt. B. & B. mine at Sylvanite, Mont.

GEO. W. GRAYSON of Oakland, Cal., is at Baker City, Oregon.

F. DELMAINE is Supt. Golden Treasure mine, Grass Valley, Cal.

A. RODGER, Supt. Cedar Creek mine, Shady Run, Cal., is in San Francisco.

A. W. HAWLEY, Supt. Cariboo mine, McKinney, B. C., is in San Francisco.

J. TOURTELOTH, Supt. Lappin mine, Deadwood, Cal., is in San Francisco.

J. O'CONNELL, Supt. Spring Gulch mine, Sonora, Cal., is in San Francisco.

J. M. LAKEMAN, Mgr. Wisconsin mine, Grass Valley, Cal., is in San Francisco.

A. D. FOOTE, Supt. North Star mine, Grass Valley, Cal., is in San Francisco.

T. J. HOUGHTON, Supt. Pocahontas mine, El Dorado Co., Cal., is in San Francisco.

A. A. BRANN, Mgr. Bay State M. Co, has returned from Spokane to Chewelah, Wash.

E. J. KENDALL, Supt. Taylor mine, Garden Valley, Cal., has returned from Los Angeles.

JAS. ELLERY, owner of the Three Sisters mine, French Gulch, Cal., is in San Francisco.

F. O. WOOD is succeeded by E. Smith as Supt. of the Christmas mine, Cripple Creek, Colo.

J. MCGREGOR, Supt. Diadem mine, Forest, Cal., has returned to the mine from San Francisco.

O. S. BUCKBEE, Supt. Confidence mine, Confidence, Cal., has returned to the mine from San Francisco.

D. KEITH, Mgr. and part owner of the Silver King mine, Park City, Utah, left San Francisco for Salt Lake City.

JOHN M. GLEAVES of Shasta Co., Cal., was this week appointed United States Surveyor-General in place of W. S. Green.

F. ENZENSPERGER has resigned as Supt. of the Norwegian mine, Sonora, Cal. His successor has not yet been appointed.

JOHN ROSS JR, Supt. of the Wildman-Mahoney mine, Sutter Creek, Cal., will also superintend the Potazuba mine, Sutter Creek, Cal.

JAS. E. SANDIDGE, M. E., of Denver, Colo., is in San Francisco closing the purchase of some Tuolumne county properties for his Colorado principals.

MAJOR W. H. HEUER and Lieut. H. Deakyne of the U. S. Debris Commission have returned from Smartsville, Cal., where they were in consultation with State Debris Commissioner J. F. Kidder.

Commercial Paragraphs.

THE number of arc lamps manufactured and shipped from the factories of the General Electric Co. within the past fiscal year has exceeded 24,000. Many thousands of the General Electric enclosed arc are now in service and the introduction of the alternating enclosed lamp has still further increased the sale.

THE Vulcan Iron Works of San Francisco are building a wire-rope tramway for conveying cordwood across the Colorado river to supply the mill of the Temple Bar Con. M. Co.; also an hydraulic hoisting apparatus for raising and lowering the ferry slip apron connected with the ferry service of the Union Colliery Co., Vancouver Island, B. C.; also miscellaneous mining machinery—rock breakers, ore feeders, hydraulic giants, etc.

THE 40-stamp mill concentrating plant built by the Colorado Iron Works Co. for the Dexter Mining Co. at Tuscarora, Nevada, began operating on Feb. 3rd. This mill is an up-to-date one in every respect, the ore being handled automatically from the time it is mined until it reaches the tailings pond at the cyanide plant. The Colorado Iron Works Co. have closed a contract for a 100-ton concentrating plant. Their high-speed narrow face rolls will be used exclusively to do the fine crushing. The Fernando Mining Co. of Fernando, Mexico, are the purchasers of this plant.

List of U. S. Patents for Pacific Coast Inventors.

Underground Surveys.

To determine the position of the end or breast of a tunnel and its depth below the surface at that point, set up the instrument at a point outside the tunnel, so as to command as long a sight as possible into the tunnel, and also the surface of the mountain above it. If the end of the tunnel can be seen from the station, a course and distance can be taken at once to the breast, and this course and distance duplicated on the surface. Vertical angles can then be measured to the points thus determined on the surface and in the tunnel, and the calculation of the depth of the breast below the surface may be made from the data thus obtained.

In case the breast is not visible from the first station, take as long a sight as practicable to Station No. 2, and before removing the instrument reproduce Station No. 2 upon the surface as in the preceding case, thus avoiding a resetting of the instrument at Station No. 1 when the underground work is completed. At the same time measure the vertical angle to Station No. 2 in the tunnel. Set the instrument at Station No. 2, and after having obtained the back readings to Station No. 1, measure the course, distance and vertical angle to Station No. 3.

Repeat the above operations at the different stations until the breast is reached, taking any measurements of the work that may be necessary, and leaving station marks for future reference. Set the instrument over Station No. 2 on the surface and very carefully duplicate the courses and distances measured in the tunnel, at the same time noting the vertical angles between the surface stations. The vertical angles can be measured most easily by sighting to a point on a short staff at a height above the station equal to the height of the instrument.

It is advisable to explore the tunnel before surveying it, as then any difficulties can be provided for and the stations selected more advantageously. Sometimes the course from Station No. 1 to Station No. 2 is assumed as a meridian of the survey and all courses deflected from it, but it is better to use the true solar course between these stations because the field notes can then be placed in the table for calculation without further reduction.

Example.—Following is a specimen of the field notes of a survey of a tunnel both underground and surface:

FIELD NOTES.

Station.	Vertical Angles. In Tunnel.	Vertical Angles. On Surface.	Course.	Distance. Ft.	Remarks.
1	.....	.....	S. 36° 50′ W.	19.1	To mouth of tunnel.
2	+1° 18′	+10° 35′	S. 36° 50′ W.	99.1	To Station No. 2.
3	+0° 31′	+15° 43′	S. 49° 47′ W.	104.2	" " 3.
4	+0° 45′	+14° 27′	S. 40° 0′ W.	37.1	" " 4.
5	−0° 34′	+16° 17′	S. 4° 55′ E.	56.5	" " 5.
6	+3° 37′	+12° 21′	S. 71° 15′ E.	46.0	" " 6.
Breast	+3° 30′	+13° 56′	S. 77° 30′ E.	40.7	To breast of tunnel.
		−17° 56′	N. 16° 16′ E	266.57	From station on surface over breast of tunnel to Station No 1.

The following table shows the method of reducing the survey. The first six columns represent the ordinary method of reducing a traverse to a straight line. The agreement between the resultant and the check course proves the accuracy of the field work.

Columns 7 and 8 contain the vertical angles in the tunnel and the rise or fall in feet corresponding to them.

Columns 9 and 10 similarly contain the vertical angles of the courses and distances on the surface and the difference of elevations between stations corresponding to them.

The algebraic sum of the vertical heights in the tunnel gives the difference of level between the Station No. 1 and the breast; and the sum of the differences of elevation in column 10 gives the total difference of elevation between Station No. 1 and the point on the surface over the breast.

The difference of columns 8 and 10 shows the depth of the breast or end of the tunnel below the surface. The tangent of the angle obtained by dividing the sum of the elevations in column 10 by the length of the resultant distance should agree with the vertical angle read to Station No. 1 from the point on the surface over the breast of the tunnel.

The process of briquetting fine-grained ores, devised by Thomas A. Edison, might possibly be applied with success to the Mesabi ores, which now require an admixture of one and one-half to three times their own volume to bring about satisfactory work in furnace. Magnetic concentration would be impossible, as the Mesabi ores are not magnetic. There are enormous deposits of magnetic ore having jasper and quartz gangues in the older ranges, and the Edison process, if a commercial success in New Jersey, ought to be successfully applied here. Previous experiments in ore concentration have proven flat failures. With ore at the present prices, a concentrating process would need be very economical in order to allow a profit. The Wenstrom magnetic separator, much upon the Edison plan, was tried at Michigamme eight years ago, but, after a prolonged series of experiments, was found a failure. A $300,000 investment was made fifteen years ago at Negaunee by Philadelphia and Albany gas magnates, in the Negaunee concentrating works. After the enormous building, which was the largest wooden structure ever erected, had been filled with costly machinery, built to order, it was found that the specific gravity of the ore and its gangue of jasper was so nearly the same that it was practically impossible to separate ore from rock by gravity and washing. A $3-a-day miner with $5 worth of material could have demonstrated this fact in a week's experimenting, but nobody happened to think of experimenting before the plant was built, there being almost a panic on the part of the gas men for fear that some one else would think of the same thing before their mill was completed.—American Manufabturer.

Petrified Forest Protection.

Land Commissioner Hermann is at work on a special report to the Secretary of the Interior, recommending that a forest reserve be made out of the petrified forest of Arizona.

Recent reports received by the Interior Department about the condition of this forest indicate that it is rapidly being used up for commercial purposes, and, unless the Government steps in to stop the despoilment, the whole forest, which is one of the greatest natural curiosities in the world, will disappear. There is now building in Denver a hotel, all the walls of which are to be faced with the silicified wood to be taken from the forest, and all the tables for the hotel are also to be made of it. At this rate of consumption it would not be long before all the petrified wood would be used up. Commissioner Hermann thinks that there is immediate necessity for action on the part of the Department. It is his opinion the best way in which the forest can be preserved is to make it a forest reserve.

The forest is located near Holbrook, in Apache county, Arizona. The largest and finest specimens of silicified wood in the world are taken from it. Whole trunks of trees and stumps with portions of the roots are found there, converted into stone as dense and hard as the finest agate. Every cell and every fiber of the former wood is preserved in stone. A forest of trees appears to have been entombed in the rocks and to have been preserved by a slow process of replacement by silica from solutions permeating the bed. Subsequently the surrounding sediments were washed away but the enduring fossils of the trees remained.

Tons upon tons of specimens have been taken away by collectors and dealers. A company has been formed in South Dakota for cutting and polishthe stone for architectual and decorative work. Sections of these trees, 4 feet in diameter, and large enough for the tops of tables, have been cut and polished. Many specimens were shown at the Paris Exposition, where they were greatly admired for the perfect preservation of every detail of structure of the wood, for the very high polish, and for the exquisite interblending of colors in the mass, due to the presence of various oxides in the original silicifying solutions. No other country in the world, it is claimed, can send to the lapidary such magnificent raw material of this nature as the petrified forests of Arizona afford. Not even the imperial works at Ekaterinburg, in Russia, with their wealth of kalkansto jasper, massive malachite, and other superb ornamental stones, can rival the beauty of the agatized wood of Arizona.

Commissioner Hermann is confident that Secretary Bliss will agree with him, when the facts are brought to his attention, of the wisdom of making some provision to protect this wonderful curiosity from despoilment.

To build a sewer inside of a sewer in Worcester, Mass., a coffer dam was constructed and the materials delivered to the workmen in electric scows, which worked to perfection, it is said. The sewer in that city is a large one, 18 feet wide and 13 feet high, which carried off both storm water and sewage. As it was desirable to separate the two, a smaller sewer 6 feet wide was built inside the larger one, utilizing the bottom and one side of it for the walls. A double trolley system was used in the work, the wires being hung from insulated brackets in the arch in such a way that a trolley could be run on each, two wires being necessary, one for the return current. There were six electrically propelled boats run to and fro, and they readily handled 12,000 bricks, fifty barrels of cement and 100 barrels of sand daily. Electric lights supplied the necessary illumination; electric fans provided the ventilation, and electric pumps aided largely in the rapid construction.

The largest generator for electric traction work ever built is now under construction at the works of the General Electric Co. at Schenectady, N. Y. When finished, it will be installed at the Logan-street station of the Louisville Railway Co., Louisville, Ky. On account of its large diameter the armature of this generator cannot be transported over the railroads in its completed state, either erect or on its side. The generator will, therefore, be assembled in Louisville. The completed machine will have twenty-two poles, an output of 2400 kilowatts or 3000 H. P., and will be driven at a speed of seventy-five revolutions per minute by a 4000 H. P., cross-compound engine to be furnished by the Allis Co. The generator will be constructed to stand an overload of about one-third, so that the capacity in case of emergencies may equal 3200 kilowatts or over 4000 H. P. The principal dimensions of the machine will be as follows: Diameter of field frame, 19 feet; width of field frame, 4 feet 1 inch; diameter of armature, 12 feet 9 inches; diameter of commutator, 9 feet 8 inches; diameter of shaft, 2 feet 3 inches; total weight of armature and commutator, 83,000 pounds; width of armature, 5 feet; width of commutator, 21 inches; total width of generator, 77 inches; total weight of generator complete, 174,000 pounds. Previous to the manufacture of this machine, the largest generators constructed for electric railway work were those of 1600 kilowatts or about 2500 H. P., the first of which was used in the Intramural power house at the World's Fair.

W. L. Watts, field assistant to the State Mining Bureau, during his investigations in '97 covered all the territory lying between the Santa Ana river and the western extremity of the Puente hills, within which are the oil fields of Whittier, Puente, the Santa Fe fields, near Fullerton, and other less important ones. Prospect work has also been done on new lands embraced within that area and also on the Chino ranch. The official report of Mr. Watts will be accompanied by a geological sketch map on a scale of 4 inches to the mile. This map will give in much detail the physiognomy and geological formation of the territory embraced, and which covers an area of about twenty miles in an easterly and westerly direction, and from two to five miles in a north and south. Mr. Watts has now begun an investigation of the Los Angeles local fields, including that portion of territory lying between Los Angeles and the Puente hills. He will also collect statistics for a bulletin to be issued by the State Mining Bureau, in which will be shown by counties the mineral products of California for the year '97, to be issued about May.

A substitute for German silver can be made by the use of manganese, the different metals and their proportions being as follows: Copper, 67.25 per cent; manganese, 18 50 per cent; zinc, 13.00 per cent; aluminum, 1.25 per cent. The color of this metal is said to be very good, resembling German silver closely. It is fully as strong as the bset German silver and has superior casting qualities, which will be appreciated by foundrymen who have experienced some of the difficulties in casting German silver.

A new process has been suggested that will effectively protect iron from rust. A solution of ferrocyanide is mixed with a flaxseed varnish, to which has been added a little turpentine or benzol. The evaporation of the alcohol leaves the flaxseed varnish, which forms a coat and protects the cyanide of iron, which is deposited upon the metal by the use of the ferrocyanide. The only preparation iron requires for this treatment is to remove any rust that may have formed on it which may not admit of the action of the solution.

Mining Summary.

CALIFORNIA.

Amador.

Operations at the Monte Christo have been suspended since Jan. 1st. It is assumed that the present holders of the bond from Robinson Bros. are trying to sell their option.

In the Amador Queen shaft two power drills are being used in sinking.

The owners of the Reward mine, at Pine Grove, are sinking a shaft on the ledge and are down 80 feet.

Work, which was suspended in the Alma, at Jackson, some weeks ago, has not yet been resumed.

Operations on the Ivanhoe, at Plymouth, are being resumed by Salt Lake people.

The Republican says that the Centennial mine, near Plymouth, has closed down.

A few years ago Gillick & Lyle sunk a shaft on the Stud Horse claim, encountering the ledge and taking out some valuable ore. Work was recently resumed and a new shaft sunk, going to the ledge 50 feet in depth It is 2½ feet thick, containing a phenomenal percentage of ore.

Ledger: The Iron Mass, at Robinsons, is extending levels and opening the property underground. They have 300 tons of ore ready to crush.

Dispatch: The shaft at the Oneida is sinking at the rate of 2 feet a day. They will sink 200 feet deeper, having started at the depth of 1375 feet. There is very little water to contend with.

The Reward, near Pine Grove, is sinking a one-compartment shaft on the ledge. The intention is to sink to a depth of 150 feet and then drive a level south 100 feet, to intersect the pay chute worked at the surface. The rock is looking well in the shaft.

Butte.

The Banner mine, four miles from Oroville, is locally credited with being "the deepest mine in the State." There are shafts in Nevada and Amador counties—the Kennedy and Idaho—2200 feet deep, and the Banner shaft is only 1000 feet deep, but the fact that the bottom of the shaft is 500 feet below the level of the sea is cited.

F. P. Martin, at Bidwell Bar, from a limited run in one day cleaned up $40, of which a large nugget weighing $20.83 was a part.

That quartz ledges go deep in this county, says the *Mercury*, has been demonstrated at the Banner mine, where the bottom of the shaft is 500 feet below sea level. The English owners of the Petewood drift gravel mine, near Magalia, have decided to open it up by a new tunnel.

The Clark Bros. have been blasting dirt on their claim at Yankee Hill and are ready for water.

L. Denny has begun to open up the old Barteece claim, near Concow.

Calaveras.

(Special Correspondence).—The sale of the Royal mine, near Copperopolis, was announced in the MINING AND SCIENTIFIC PRESS in the issue of Dec. 4th, '97. The purchaser, as stated, is J. C. K. Van Ee of London; the sellers are I. R. Wilbur of San Francisco and Peters & Cassell of Stockton. The price is $400,000. The property consists of six claims, of large ore bodies which thus far have been of low grade. The shaft is only 700 feet. It is to be changed to a three-compartment and sunk to 1200 feet. Sixty stamps are to replace the present twenty, and new hoisting works will be erected. The property is within three miles of this place. The examinations of the property for the London purchaser was made by W. P. Miller of San Francisco, W. R. Beall of South Africa, J. Barr of Scotland and W. R. Farish of Colorado. Their estimates foot up the "ore in sight" at 105,000 tons.

Copperopolis, Feb. 12th, '98.

The Melones Development Co. at Robinson's Ferry has been succeeded by the Melones Mining Co., incorporated under the laws of West Virginia, and is now running a tunnel on the property held under bond by the company. They have opened the South Carolina mine, which had a tunnel 1200 feet long, and starting from that point are driving it 1520 feet farther. The drills commenced work Jan. 3rd and are averaging 54 feet per week. The tunnel is 6x7 feet and traverses at present greenstone and stringers of quartz.

Supt. Regan has finished reopening the old incline from the surface to the bedrock in the El Encino mine at Mokelumne Hill. Present indications are said to be favorable for rich gravel.

At the Hog Pen mine an open cut 80 feet and a tunnel 90 feet in length have been run.

Work goes on at the Great Western mine. A new vein was recently struck in running a crosscut.

A new 20-stamp mill is being erected on the Lightning mine.

The ditch intended to conduct water to the Jupiter G. M. & W. Co.'s claim at Dogtown is completed. It is of 2000 inches capacity and twenty-one and one-half miles long. Everything is in readiness for operation as soon as the rain sets in.

Echo: Some rich ore has been discovered in the Finnegan mine at Carsons.

Citizen: The California Exploration Co. has given up the Gottschalk mine.

El Dorado.

(Special Correspondence).—M. J. Williams, one mile south of the old Springfield mine, is opening a property that gives promise of being a big mine. The shaft has reached 45 feet, at the bottom of which he has a ledge that mills from $10 to $12, exclusive of sulphurets. The formation is in slate, and the property is on the mother lode.

The bond on the Pocahontas has been extended for another year. It is expected that work will be resumed very soon. The parties promoting the development work are Paul A. Fusez, Rumsey, and McClure of St. Louis. They erected a stamp mill and air compressor, and straightened and retimbered the old Burlingame shaft to a depth of 400 feet. The Burke shaft has also been put in good condition, and the two, 415 feet apart, are connected at the 300 level.

The German mine, an abandoned property, has been reopened and a 5-stamp mill is in course of construction. The property was purchased about a year ago by Chas. D. Richards of San Francisco.

The Gearhart mine and mill, one and a half miles south of the old Church-Union, was purchased by Chas. O Richards of San Francisco, who has also liquidated the incumbrances.

Diamond Springs, Feb. 14th, '98.

(Special Correspondence) —The Esperanza, near Garden Valley, purchased about one year ago by an English company, has completed a 10-stamp mill and also bought adjoining claims. The old Esperanza shaft was unwatered and sinking is in progress. The ore was of ordinary grade in the old-time workings, but in the bottom of the present shaft they have come into specimen ore.

The Sunset, near Kelsey, after eighteen months of idleness, has resumed development work. There is a 10-stamp mill on this property. The prospects for this mine are growing brighter

The Big Sandy has a year's supply of ore ahead for its 10-stamp mill.

The 4-stamp prospect mill, one and a half miles north of Georgetown, owned by an Eastern company, is running on a large ledge of fair-grade ore.

Georgetown, Feb. 14th, '98.

Near Green Valley the Kipps are taking out coarse gold.

At Greenville, Clark and Robinson have decided to open up the old Greenstone mine.

Giebenhain & Co. are taking good ore from their Deutcher Bund claim, which they estimate will go $50 per ton.

The Carmelita mine, near Gray's Flat, is still running and shows good prospects.

The shaft on the Comaliti mine, ten miles west of Placerville, is 80 feet and shows a 2 foot vein of good ore. This property is being developed by a company from Alameda county.

Work has been resumed on the Pocahontas.

Dench & Craddock are doing development work within half a mile of Placerville and taking out good ore.

The Lemon mine, adjoining the town of Placerville, is producing fair grade ore.

Myers & Morrow, adjoining the Gentle Annie on the east, are sinking and taking out specimen ore.

Work at the Mount Pleasant, Grizzly Flat, is progressing.

Nugget: The Grizzly Flat gravel mine is running full blast. There are forty men employed. The property is controlled by Col. Sutherland and L. Gilson of London.

The Eagle King mine and ten stamps are running. This property is owned by Melton & Witmer of Placerville.

There are fifteen men working at the Mount Hope mine, Grizzly Flat.

In two days' work on the Hunt ranch J. Thomas secured $83.90 in nuggets, the largest weighing $20. The other large ones weighed $12 and $18.

On the Johnson mine, near Granite Hill, two shifts are sinking and getting fair prospects.

Five men are opening a mine on the ranch of W. Veerkamp at Granite Hill.

Larkin Bros. are developing a portion of their property, three miles east of Placerville. They struck a 6-foot ledge of pay ore.

Kern.

The shaft on the W. J. Bryan, at Johannesburg, is down 80 feet, with good ore on the footwall. Four lessees are at work in different localities of the mine and making good wages.

The Rademacher mine is down 150 feet, with some drifts and crosscuts, and has 500 tons of ore on the dump that will average $100 to the ton.

The Blue Chief is improving as it attains depth. The ore averages $40 to the ton.

The Forest Springs has a tunnel and drift aggregating 150 feet with a 6-inch vein of high grade ore.

Rand: Considerable development is being done in Dutch Gap and on Dead Horse Flat.

The main shaft on the King Solomon, near Johannesburg, is being sunk as fast as two shifts can do it. Good ore is found all the way down.

The Pinmore property has been shut down until a 40-stamp mill can be built.

J. Winfield discovered a vein in the Hector claim on Bull hill and has a 100-foot lease from the Ashford M. Co.

The Yellow Aster took out $31,000 worth of gold in January. There were 136 men on the payroll at Rand Mountain.

Rodgers & Co. have a shaft 92 feet on the Income mine, with a vein of ore 2 feet all the way down.

Conklin & Baker of the Elephant are taking out good ore.

Walley & Thompson are taking out ore from the Gipsey and having it milled at Kohen Springs, with good returns.

Madera.

(Special Correspondence).—The Mud Springs mill cleaned up last week $5000 after a thirty days' run. This is exclusive of the value of the sulphurets, which are sent to Vallejo for treatment.

The 3-stamp mill on the Keating mine, adjoining the Mud Springs, is now in running order and is working satisfactorily. The motive power is a 10 H. P. crude oil engine.

The new 2-stamp mill recently placed on the Standard mine has commenced operations, the late rains having furnished a sufficient supply of water.

Russell and Bettner have located a claim, known as the Swiftwater Bill, on the extension of the Magnet lode. At a depth of 10 feet they have a 12-inch vein of $10 rock, free gold, and a percentage of sulphurets.

Gold, Feb. 14th, '97.

Mono.

Supt. Kermeen is running a tunnel on the Dunderberg at Bridgeport to tap the ledge 150 feet below the present working. The tunnel is in 175 feet and the intention is to run it 700 feet. The work of taking out ore from the upper works goes on and the mill is kept running.

Nevada.

(Special Correspondence).—The Empire, in sinking below the 2200 level, has come into very good ore. This property has been a producer since 1857, and its product is not diminishing with age. There are forty stamps in operation. R. Walker is Supt.

The Orleans, adjoining the Empire, is running a drift, which has reached 360 feet, for the Rich Hill ledge on the 800 level. Three eight-hour shifts, air compressor and electric power are pushing the work. The property comprises eighty-three acres. C. A. Brocklington is Supt.

At the Golden Treasure, a property on which after years of idleness work was recently resumed, the shaft has been unwatered and crosscutting both ways is going rapidly forward. The old tunnel has also been cleaned and is being driven on the ledge. F. Dulmaine is Supt.

Grass Valley, Feb. 14th, '98.

W. J. Rogers, in the Mistletoe mine, near Rough and Ready, has a 4-foot ledge of good ore.

The Bellefontaine M. Co. has levied an assessment of 1 cent per share, delinquent March 15th.

The Knickerbocker gravel mine, one mile west of Nevada City, will be sold at referee's sale February 23d.

Telegraph: At the Reddick gravel mine the tunnel has reached 800 feet, and the deposit is 50 feet wide. A mill will be erected to crush the gravel.

The ledge on the Gaston Ridge mine near Graniteville is 6 feet wide and opening to 40 feet in places. The rock is both low and high grade. Over $60,000 has been spent in developing the property.

Telegraph: The clean-up at the Pittsburg mine this week paid $16.50 per ton. There were forty and one-half tons milled, yielding the tributers at the rate of $7 per day. Work is going on in the 700, 600 and 500 south, and water is down to the 800. In two weeks the water will be down to the 1000 level, and drifts north and south will be run in virgin ground. The ledge where the work is being done is large. Supt. Granger says there will be 100 men employed inside of sixty days.

Placer.

Ten additional stamps are being put in the Gold Blossom mine, making thirty stamps at work.

Plumas.

Bulletin: Firmstone & Richards have resumed work in the Phœnix mine, below the Round Valley reservoir. The tunnel is in 120 feet, running along the hanging wall of the vein, which is 8 feet in width. In a milling test the ore yielded about $4 per ton the entire width of the vein.

The Treleaven Bros. are reopening the old New York mine, near Greenville. About 400 feet of the old tunnel has been repaired. Prior to the death of one of its former owners this mine yielded handsome profits.

W. S. Drury continues development work southwest of Greenville.

Standart & McGill are developing their property near Round Valley.

McLeod & Brown are giving their attention to a quartz proposition on Wolf creek, near Greenville.

B. F. Gullic is prospecting at the Hibernia mine.

Riverside.

The Blue Rock has a 50-foot tunnel on the ledge and intends to go 50 feet farther. Where it left off it has a 20-inch ledge of good ore and about sixty-five tons of good ore on the dump.

San Bernardino.

On the Hidden Hill over 100 feet of work has been done, consisting of a 30-foot shaft and a 76-foot drift on the vein, which is 4 feet wide. About $15,000 has been taken from the property in development work, and it is now idle owing to litigation. The mine is 20 miles north of Fenner.

San Diego.

(Special Correspondence).—A complete compressor plant is being placed on the Kentuck, near Banner. It is the intention to run a tunnel 1200 feet to intersect the rich Kentuck vein at a depth of about 450 feet.

By request of Mr. Brice, who claims to be able to extract gold from antimony by secret process, a sample of high-grade antimonial ore was sent him to his Chicago office about four weeks ago, under promise that he would give it a thorough test, but up to this time the Laguna Mining Co., which sent the ore, has heard nothing from it or him.

The unusually deep snow (about 3½ feet) in the mountains bordering the desert in this county put a quietus on prospecting for a time, and very much retarded mining development for a time.

Julian, Feb. 10th, '98.

Union: D. B. McIvor of Poway has discovered tin ore on his ranch, which is said to be identical with Temescal ore.

A ledge of gold-bearing rock has been discovered in the Fallbrook section.

Shasta.

(Special Correspondence).—The Three Sisters mine, one and a half miles above French Gulch, has a tunnel 400 feet on the ledge, which is from 6 inches to 3 feet wide, and of high grade ore. The property, owned by Ellery Bros., has been bonded to Motherwell & Howell for twelve months for $20,000. Work has begun, sinking from the tunnel.

French Gulch, Feb. 13th, '98.

There has been some question among observers of the operations at the big copper mine at Keswick whether it was a paying proposition or not. The Redding *Free Press* sets this at rest by showing that the company is producing about 125 tons of matte daily. This matte contains $110 per ton in copper, $13 in silver and $18 in gold, or a total of $141 per ton—a monthly yield of $530,000. As against this sum about $85,000 is paid in freights and about $115,000 in wages, improvements and other expenses, leaving a margin of over $300,000 per month for profit.

The shaft on the Kangaroo mine is on the ledge to a depth of 40 feet. The ore taken out yielded $15 per ton.

The new crusher and furnace at the Keswick smelter is about ready for work. The capacity of the smelter will be in the neighborhood of 1500 tons per day.

The Taylor tunnel, near Shasta, is in 225 feet. It has cut through fine prospects, especially in the last 100 feet of the tunnel.

Sierra.

(Special Correspondence).—The Last Chance mine, from ninety-one cars of gravel, cleaned up $1015. The cars in use measure 4½ feet by 24 by 22 inches.

Forest City, Feb. 14th, '98.

The Grasshopper mine, at Poker Flat, has struck good pay. In last week's cleanup they found two nuggets weighing $60 and $80 respectively.

Siskiyou.

L. D. Graeter & Co., of Montana, have secured four miles of Scott river, at Callahan's, for the purpose of mining it with a dredger. They have ten men at work, and are now sinking a shaft to prospect the ground.

Starr Bros. have taken some rich quartz specimens from their mine, at Oro Fino. They will erect hoisting works and sink on the property.

Bull Bros., on Humbug, have a ledge from 12 to 24 inches thick assaying $20 in free gold.

Runnels & Randles struck a vein in Hawkinsville district that is 12 to 18 inches wide, and from five tons milled they saved $40 per ton.

S. Richardson shipped some $60 ore from the Odd Fellow mine, in Fool's Paradise.

The Yreka Co., in running a tunnel through the Humbug range, find rock containing pyrites of iron and sulphurets, with small quartz stringers running through it. The tunnel is in about 230 feet.

The Starr Bros., at Oro Fino, have struck good quartz in the old Pitz mine, and are putting in machinery to work on an extensive scale.

The Hollister Co., working the old Spencer mine, on Humbug, is pushing work on the tunnel.

The Colorado Co., operating the Hegler mine, on Humbug, commenced a new tunnel, which is in about 200 feet.

Journal: The Greenhorn mine has been sold to Waybright & Heard for $12,000. This is an extensive placer mine, with a large area of bedrock blue gravel that pays with steady regularity. F. P. King is the Supt.

H. Harris is opening the old tunnel of the King Solomon on Humbug, formerly the Mockingbird mine. The ledge ranges from 4 inches to 1 foot.

The Spencer and Hegler mines on Humbug are running tunnels to strike the ledges at greater depth.

Trinity.

(Special Correspondence).—The Lappin mine situated about one mile from the Brown Bear gives evidence of becoming a permanent producer. There are six locations in the group. The company has run three tunnels, aggregating 400 feet, at a depth of 500 feet. In the prospect work the ore has been worked by arrastra, but a 5-stamp mill will be erected at once. Some of the ore is exceptionally high grade. I saw a Selby certificate showing $836 per ton.

Deadwood, Feb. 12th, '98.

The Moody Gulch G. M. Co., two miles above Lewiston, has installed a complete hydraulic plant, and is ready for work.

R. A. Skinner, from 780 tons of ore on the Yellowstone mine in East Fork, in seventy days' run of ten stamps took out $9000.

C. C. Gilman and G. McNeil, Pres. of the Montana Dredging Co., arrived at Lowden and put six men at work prospecting on Poker Bar with a view to putting in a dredger.

Tuolumne.

(Special Correspondence). —The Philadelphia Diggings, twenty miles from Sonora, are hydraulicking day and night. The property comprises 640 acres and is owned by Stockton people. The company contemplates building an eleven-mile ditch from South Fork and another thirty-two miles long from the main river, where at low mark it will supply 10,000 inches of water.

Development work on the Star continues, though the stamps are hung, awaiting water.

At American Camp the Gray Eagle mine, owned by Korbel Bros. of San Francisco, a 2-stamp prospect mill is being built. The shaft on the ledge is 100 feet. There are two ore chutes, one of which is 2 and the other 8 feet wide, the ore from one of them running $100 per ton.

At the Spring Gulch mine they are drifting on a 48-inch ledge of a good grade of ore. The formation is in slate.

In the McKinley the shaft is 60 feet laterally on the ledge. The first level, at 55 feet, is yielding good ore.

The gravel claim at Little Pine is ready for hydraulicking, awaiting water. There are 250 acres in the property.

The old Riverside quartz mine is being reopened by Dr. Plank of San Jose. He has remodeled the 10-stamp mill and added new concentrators. There are three tunnels, one of which is 1600 feet, and 1800 feet of adit

levels. The ledge is from 4 to 6 feet, of an ordinary grade of ore, but rich in sulphurets. The mill is running continuously.

The Confidence is placing a canvas plant and making additional improvements. The company ships about fifteen tons of sulphurets every month that run $250 per ton.

Blake and San Francisco people are beginning work reopening the old McKinney mine, two miles west of Columbia.

Feb. 14th, '98.

Democrat: In the Pennsylvania twenty miners are at work. D. Neagle is Supt. The main shaft is 160 feet deep. The vein is from 18 inches to 4 feet, and mills from $25 to $300 per ton free gold. The rock contains from 3 to 5 per cent sulphurets, ranging from $150 to $400 per ton.

Pumping the Wheal Perin shaft commenced last week. The shaft has a depth of 100 feet.

G. A. Helmore has bonded to a San Francisco company his mines near Jacksonville. The consideration was $6000.

The main shaft on the Norwegian is down 300 feet, with plenty of ore in the bottom and throughout the underground workings.

Retimbering and straightening the old tunnel on the Sell mine has begun.

A new mill is to be put in at the Butler mine at Big Oak Flat.

NEVADA.

The ledge on the Lion mine, at Elko, is 8 feet wide, and assays $24 gold.

The De Lamar mill treats 300 tons daily.

Next month the Peck concentrator at Pioche will be in motion. Its operation will be of interest, as the State has several propositions similar to that which inspired this undertaking, which has in view the handling of the tailings from the old Pioche mill. The dump, which contains about 70,000 tons of tailings, has been contributed to by nearly every mine in that district. The result is gold, silver and lead, with an average value of $16 per ton.

At Tuscarora twenty out of the forty stamps are dropping at the Dexter mill and handling three tons of $20 ore to the stamp daily.

The Mountain City *Times* says that Gold Creek, Elko county, may come out all right. It says: "The people who started it were amateurs at mining. Of the more than $600,000 which was expended there, not enough was spent in following ore to develop any of the well-known quartz ledges 10 feet. It is also believed that all the work done there could have been accomplished by miners for, at most, $100,000, and possibly for half that sum."

OREGON.

In Saxe creek district, Jacksonville, there are eighty-seven mining properties actively operated, fifteen hydraulic plants and twenty-six quartz mines.

The Powell Creek M. Co., near Grants Pass, has seventy-four men at work.

The Eureka Co., operating the Miller mine on Soldier creek, near Ashland, will put on six concentrators.

W. Newhouse purchased the placer claim on Gall's creek and will work it on an extensive scale.

The Soda Springs M. Co. has incorporated, with principal office at Ashland; capital stock, $60,000.

Wimer Bros., at Waldo, are running two giants on good gravel.

The Sterling mine, Jackson county, is running two giants.

Smith & Beers are running two giants seven miles from Waldo. They have several hundred acres of placer land.

New placer ground is being opened seven miles above Grants Pass.

The Jewett mine, four miles from Grants Pass, is running on $18 ore. The ledge is 8 feet wide.

According to the Baker City *Republican*, G. W. Grayson seems to have no desire to longer keep secret the fact that the Virtue has been abandoned, and recently remarked that his company had some time ago blocked out some ground which they thought would pay to mill, but a test made proved a financial failure. There is still good ore in the mine, but the heat encountered as depth is attained does much to interfere with the working of the mine at a profit. Mr. Grayson will devote some of his attention to the Climax, in the Cracker creek district. Some of the machinery from the Virtue is being dismantled for transportation to the Climax.

The *Tidings* says that the Bohemia Gold M. M. Co., southern Oregon, closed down for the season. The clean-up for the month is reported something over $13,000. In the last eleven days' run of the 5-stamp mill $6500 was the result.

In 1897 there were 501 locations, 40 affidavits of labor, 1 mill site, 5 tunnel rights and 56 water rights recorded in Grant Co.

WASHINGTON.

The first car of ore from the Gladstone group near Boundary was shipped last week.

The Republic mine at Eureka has started tunnel No. 3, to cut the vein approximately 400 feet below the level of tunnel No. 2. They expect to drive 1800 feet and the work will take a year.

BRITISH COLUMBIA.

(Special Correspondence.)—On the Blue Jay tunnel the ledge is reached at a distance of 166 feet.

The Morning Glory M. Co. is dissatisfied with the present management. Work is shut down.

The Density has not yet resumed work on the tunnel, but a start will soon be made.

Vernon, B. C., Feb. 12th, '97.

The sale is reported from Rossland of the Columbia and Kootenay mine by the British American Corporation for $275,000. The property consists of four claims.

The Monte Cristo and Colonna mining companies at Rossland have been consolidated, the owners of the stock in the two being practically the same people. The new company will be known as the Cristo Con. M. & D. Co. Each of the old companies had a capital of $1,000,000. The new company increases the capital to $2,500,000. G. Pfunder has been Supt. of both mines and will act in the same capacity for the consolidated company.

The Canadian Pacific Exploration, Limited, of London, has bought the Big Four group, half way between Rossland and Nelson, for $50,000, paying $10,000 down.

Vancouver *Mining Critic*: Over $100,000 worth of coal mining machinery, including electric coal cutting appliances, will shortly arrive at the Crow's Nest Pass Coal Co.'s mines at Coal creek, East Kootenay. The machinery is on the best modern principles.

New Mex

Davidson & Bell, at the Golden Giant mine in Pinos Altos, are sinking the main shaft. Rich gold ore is being taken from the bottom of the shaft and from the stopes on the 350 level.

The Pinos Altos Gold Co., principally owned by the Hearst family, is doing vast development work. Upon the Pacific vein they have opened an ore body at the 500-foot level which is so far demonstrated to extend 2800 feet along the vein. The ore ranges from 1 foot to 5 feet in thickness, and gives returns from half an ounce to seven ounces gold per ton.

The British-American corporation, represented at Rossland by C. H. Mackintosh, has purchased to date in Rossland nine mining properties, the amount of English money involved in the deals being a million and a half dollars. These purchases were all made since Janurary 1st. The properties included are: Joise, on Red Mountain, near the Le Roi mine, $300,000; Columbia and Kootenay, on Columbia mountain, $275,000; Great Western and Golden Chariot, $100,000; Nickel Plate, $150,000; Pack Train, $25,000; Legal Tender, No. 1 and Whoop Up.

It is locally believed that the Canadian Pacific Railway Company has purchased the Heinze smelter, at Trail.

Three hundred tons of ore per day are being shipped via the Red Mountain railway from the Le Roi mine to the smelter at Newport, Wash.

The Primrose G. M. Co. at Rossland decided last week to postpone any further work on the Seattle and Denmark claims until the surface could be thoroughly examined by an expert.

The Josie group, twelve miles southeast of Northport, after sinking a 90-foot shaft and drifting 85 feet on the lead, crosscutting is going ahead at the rate of 5 feet per day. Once the main body of ore is located, it is proposed to drive a tunnel 400 feet; a depth of 300 feet will be attained. The average cost per foot of the work up to Jan. 1, 1898, was $4.05, including the purchase price of steel, tools, blacksmith's outfit, etc.

A 20-foot crosscut has been run at the 50-foot level on the B. C. claim, Grand Forks, in solid pay ore, no wall having yet been reached.

The Oro-Denero property, in Summit Camp, will be opened up immediately.

Work has started on the B. C. No. 2 claim in Summit Camp.

A carload of Waverley ore was sent to Swansea from Revelstoke, and it will be followed in a few days by a carload from the Tangier. The ore is a silver-lead, showing gray copper. The management expect to get out six carloads a month.

There are two shifts at work on the Sovereign, near Trail. They will have 3 feet of $37 ore in the shaft.

The Canadian Mutual M. & D. Co. last week shipped twelve tons of lead ore from the Gladstone mine at Trail.

Redbaugh & Co. sold a half interest in the Rob Roy, near Deer Park, for $3000.

The Union Mint, three-fourths of a mile from Trail, is producing $20 ore.

The tunnel on the Red Point, at Trail, is in 396 feet.

THE KLONDIKE.

Dawson advices to January 3rd state that the Klondike miners have supplies to last them until the opening of spring. The latest strike in the Klondike region was made on Rosebud creek on the 29th or 30th of December. Rosebud creek flows into the Yukon about six miles above Six Mile creek. A stampede followed the report of the strike. There is a good prospect on a stream that enters the Yukon below Freeman's point, twelve miles below the Big Salmon. Birch creek is panning out well near the boundary. American creek, near the boundary, will give some of the rich Klondike creeks a close race. Franklin, Chicken and Forty Mile creeks are being worked by large numbers of men. Miller creek is producing more gold than ever.

This winter fully 200 claims are being worked at Dawson. There was some experimenting with winter drifting, but it was not a success. The greatest drawback is the foul air arising from the vegetation which decays when it is reached by the fires used in drifting. One man was suffocated, and several were overcome. This year machinery will be used in developing the mines. Pumps are needed to drain the cuts. There is not a steam pump in operation, and there are only two pumps in the Klondike region. A pump that will rise a sluce head of water 30 feet is what is needed.

Major Walsh is determined to enforce his recent order keeping out of the Klondike country all who have not 1000 pounds of food. Miners who have a smaller quantity of food will not be allowed to pass the lines at Tagish house, not even to go down the Yukon into American territory.

During December flour sold for $100 a sack, candles for $100 a box, and all other food for an average of $1.50 per pound. On January 1st prices on account of increased supplies, were down to $35 a sack for flour, and $35 a box for candles. Other supplies sold at an average of 75 cents a pound.

Old quartz miners ridicule the story that the mother lode has been discovered. Gold-carrying quartz has been found, but so far as known there has been no discoveries of quartz-carrying gold. Unless quartz is discovered this will be the last year of building in Dawson.

The principal mining towns of Alaska are overrun with people looking for employment. At Wrangel, Juneau, Skaguay and Dyea there are more idle men than there is work for. The thing has been overdone, and hundreds would leave the country if they had the money to pay their passage home.

To the miner who goes provided with plenty of wholesome food, warm clothing, sufficient money to make him independent, and, above all, a hardy constitution to stand the rigors of the northern climate, Alaska offers some inducements. There is gold, but it can be taken out only by strong, healthy men who go fully provided with food and clothing and sufficient money to meet the exactions of the transportation companies and the freight packers. At times a gale may spring up without a moment's notice and sweep everything before it. Such a gale swept the Lynn canal Jan. 31st. At Dyea there was very little wind. At Skaguay the wind was high and piercing, but the sun shone brightly on the snow-crested mountain tops. In the canal the hurricane attained a velocity of 105 miles an hour. It blew particles of snow from the mountains, miles away, and lodged them in the rigging of the steamer Oregon, 51 feet above the water.

Lumber at Skaguay varies from $60 to $80 per 1000 feet. Capital has not a dead cinch in Skagway or Dyea any more than it has in San Francisco. Five hundred dollars' worth of flour, San Francisco price, may be worth $1000 in Skagway or Dyea to-day, and to-morrow may not sell for what it cost in San Francisco.

Mountain packing is the hardest work known to man. Last year the ruling pay was $6 a day to a man to pack on his back, and $10 a day for men with horses.

During the past six weeks the steamers have landed at Skaguay hundreds of men, who have gone on the shore without as much as a nickel in their pockets. The pangs of hunger and the ice-cold winds take the charm out of the laboring man's life in these northern regions.

Carpenters are the only skilled laborers who find ready employment. They are paid 50 cents an hour for their actual working time. Their working hours are from 9 to 5. Their highest possible pay is $3.50 a day. There are hundreds of men in Skagway to-day who would do 'longshore work for 25 cents an hour, and be glad to be among the employed at that rate. The town has all the blacksmiths, common laborers, school teachers, waiters, barbers, dishwashers, etc., that it can support, and more, too. Every steamer sailing from Skaguay has applications from men willing to work their way home.

The real cold season begins between the middle and the latter part of January and continues to about April 1st. Cold feet, the lack of warm clothing, the unbuttoning of a coat at an inopportune moment may result in a cold which may turn into pneumonia. He who goes to that country, unless he be of strong constitution, takes his life in his hands.

Wages do not average much above $2 a day in Skaguay. Cost of living is about as follows:

Bunk per week at 25c per night	$1 75
Board, three meals per day at 35c.	7 35
Total	$9 10

This is about the minimum price for the cheapest accommodations. No matter whether he works or not, a man has an appetite for three meals. If he should attempt to reduce expenses by cutting off one meal, nature will not be long in asserting herself. The average laborer is paid better anywhere than in Alaska.

Klondike-bound miners are heading over the Dyea and Skaguay trails, stretched out all along the way from Skaguay to Dawson. Many become discouraged and return before they reach the summit, while others become frozen and have to be brought back. Cases of frozen hands, frozen feet, frozen ears, etc., on the White pass are numerous.

At times this winter the weather in the pass has been desperately cold. The wind blows the snow into the face of the traveler, the warmth of the face melts the snow, and the cold again freezes the melted snow, thus forming a mask of ice on the face, and the ice has to be broken to permit breathing.

Dyea still suffers from the lack of wharfage facilities. All Dyea freight is loaded upon lighters at Skaguay and towed around the point to Dyea.

Recently was published in these columns a letter from Aug. J. Bowie of San Francisco, who went to the Klondike last summer for Jas. R. Keene at a yearly salary of $25,000. Mr. Bowie is a standard authority on hydraulic mining and has contributed many valuable technical articles to this journal. What he has to say is worthy of note. In a letter to Prof. Thos. Price of San Francisco, dated Dec. 3, Mr. Bowie says:

"Note the hour and the temperature—2:50 P. M. and 20° below zero. I have just returned from a trip up the Yukon to the Klondike, only a mile above this place, and have said good-by to the sun for to-day. The mines are all frozen, and we are enjoying the pleasures of an Arctic winter with none of the comforts of civilization. Our means of transport are nominally by dog sleds, but should you for one moment think that you would enjoy a sled ride of this kind you would be sadly mistaken. A trip with dogs up here means going on 'Shank's mare.' If you ride you are thrown out by an upset, or get out because you find yourself on the point of freezing stiff, with a possibility of leaving one of your extremities in the sled.

"One thing is fortunate — we are not troubled with a wind of any kind, so that as a matter of fact I do not feel even 15° below zero here as much as I did some of the cold days in San Francisco.

"I bought a bottle of ink to-day, for which you would pay 5 cents in San Francisco, for the sum of $5, so you can have some idea of what things cost here. Meat now is $1.50 per pound wholesale; flour, $135 per sack of fifty pounds. Men are paid $1.50 an hour, and they are not worth that much per diem. Without exception this camp has fewer mining men than any other place I ever was in. They have not the slightest conception of mining. The only wonder to me is the fact that this place has been able to exist as long as it has under the terrible prices here demanded for everything. People in San Francisco—even Sloss & Co.—cannot conceive the condition of affairs here. There is absolutely nothing to be obtained, and it will be fully two years before these mines can be handled as they should be on account of the want of the ordinary essentials for work, let alone living. Wood sells here at $50 a cord. There is plenty of it, but no means of quick or easy transportation.

"To go back to the mines, they are certainly extraordinarily rich, but this present system of work must be largely or entirely abandoned and corporations must take hold and clean out this crowd of good-for-nothings and a new era will dawn. As for the Alaska Commercial Co. and the North American Transportation & Trading Co., the only two business concerns here, they must be met with a decided opposition, and traders must come in here, where there is ample room, if transportation lines are established. Situated as these companies are, they will throw every obstacle in the way of any and everybody coming in to compete with them, and thus keep up all their sales, and slowly but surely absorb all the gold output by the infamous prices of supplies.

"The Alaska Commercial Co. during the present famine has never raised the prices of any staple article and has been very just, but the North American Transportation & Trading Co., as soon as it finds out that the Alaska Commercial Co. has sold out any article, jump the price 30 per cent or more. Coal oil sells for $40 per gallon and candles fetch $1 each and are esteemed a luxury for breakfast. The restaurants are all closed, as are the bakers and butchers, and bacon is a thing of the past. The poorest whiskey made on the spot commands $5 per bottle and you can buy but little at that figure.

"Light just now is the most important proposition on hand. One cannot buy candles or oil now for love or money, and I can't say how I am going to drag out some of these long nights. I have only spent one night in the town, as the place is absolutely too disgusting for anything. Gin mills, loose women, dance houses, gambling houses and other delicacies of the same order are rampant.

"There is not the slightest doubt that many a poor fellow has died en route here and will never more be heard of. A man who came in the other day via Dyea told me that on the way down he saw men's arms sticking up out of the ice (the body being out of sight) grasping oars, planks and pieces of wood which the poor fellows had grabbed as they were drowning in the ice floe.

"The famine here cannot be pictured in too awful a form, and soon the fuel will give out on us, as men cannot work without food, and there is no food for woodcutters. Yesterday a poor woman in town who earns a scanty living by making fur caps was sitting in her cabin sewing, with her feet resting under a Yukon stove (a mere sheet-iron box). Not being a capitalist, she had only green wood to burn, and not much of that. This kind of wood gives out very little heat, and when the poor creature tried to arise from her seat she found that both feet had been frozen as far as the ankles. Needless to say, she had to have them both amputated.

"Some large sales have been made here to Eastern parties, $324,000 having been paid for three claims on Bonanza creek and $24,000 for two others. Twenty have been bought on El Dorado creek for $100,000. Sulphur and Dominion creeks now offer the best advantages for money. The yield of all the claims will, I think, be less than last year, as there are no supplies here for labor or materials to work with. And the famine is sure to kill off many laborers. If I do not starve to death, I shall be very lucky."

Another pilgrim writes: "To men of small means who imagine they see in this Territory opportunities to make fortunes, and who, notwithstanding all that has been said so far about the difficulties to be encountered at every point along the journey, and the probable disappointments which await them on their arrival here, are still willing, perhaps anxious, to start on the journey to the new El Dorado, my advice can be summed up in one word—don't.

"There are many disappointed, heartsick men working on the dumps here, winding on a windlass, exposed to the rigors of the climate, and with the thermometer standing at from 35° to 60° below zero—and there is worse to come—who had been advised not to attempt the trip. Many of them, while grumbling about the hardships which they have, and are still enduring, blame the newspapers for having brought them here. True, some of of the more sensational papers did give a great amount of space to that part of the story which described the riches of the district than to the other side which told of the dangers and hardships, but in looking over a lot of clippings which I brought with me, I find columns of matter advising only those who were well fitted in every way to withstand hardships and privations of the most severe nature, and who knew from experience something of the nature of the life they would be compelled to live here to attempt the journey.

"And yet they are here, and while they tell you their troubles and figure out how small, after all, is the remuneration at $1.50 per hour—and the average wages here are $1.25, while many are working for their 'grub'—for six or seven hours a day, they urge the writer to advise others to stay away.

"It is feared here that there will be another rush—many are, perhaps, already on

the way. Nothing but disappointment and loss await those who come. I shall try to explain a few of the reasons why this is so.

"The mining district known as the Klondike region comprises only two creeks that are known to be rich—Bonanza and its tributary, El Dorado. Every claim on the creek bed, as well as all the bench claims, have been located. Not all the claims, even on these two creeks, are known to be rich enough to pay the expenses of mining them at the present rate of wages—which are, after all, only sufficient to pay living expenses. Others are fabulously rich. Some of those on El Dorado will yield, perhaps, $500,000 each, while others adjoining them will not pay for the working. The same is true of Bonanza.

"There are many other creeks hereabout, every one of which, lying within a radius of fifty miles, has been staked from mouth to source, and, in many cases, to a point beyond the summit of the slope from which they run. There is, therefore, absolutely no chance of success, for there are hundreds of men here now who have spent anywhere from three to fifteen years in the Yukon districts prospecting for the gold which is said to be there, and who are still looking with longing eyes for the fortune for which they have hoped so long. When men who were within fifty miles of Dawson when the strike was made are still without the means to buy food for the winter, how can a man 5000 miles away from here hope to pick up a rich claim in the Klondike region? There are many such here.

"I cannot, knowing as much as I do of the country, use language strong enough or convincing enough to advise those who are thinking of coming to this desolate country to give up the notion. No matter how discouraging may be the outlook at home, I can assure you that there are more avenues through which to make a living, and perhaps a comfortable fortune, at home than are presented by the seemingly rich Klondike.

"There are hundreds of men here to-day who mortgaged their little homes and left wife and children poorly provided for in order to raise the necessary money to make the trip to a land which promised so much. They spent every cent of that money, which represented the labor and savings of years, in getting over the Skaguay and Dyea trails, and bore up under hardships of which they would not have thought themselves capable, in the hope of getting possession at the last of a rich claim in this region, where they had heard that men became rich in a day.

"To-day they regret their madness and curse the day when they gave up all—and received nothing in return. Many have not even reached the new El Doredo. Money 'played out,' and they were compelled to winter on the pass, while others were frozen up in the river and will either have to haul their outfits down on sleds or to live in idleness and eat the food which, on an average, cost them more than $1 a pound to get over the pass.

"The richest deposits of gold are found in the crevasses of the bedrock, which here is a kind of soft slate, and so in most of the mines the rock itself is worked out to a depth of from 1 to 4 feet. The bed of the creeks—Bonanza and El Dorado—is wide, and, as the deposits are on the bed of a former creek, or glacier, which wound about in totally different directions to the present creek, it is impossible to locate the 'pay streak' except by sinking shafts in the slow and laborious manner practiced here. It so happens that ten or more holes may have been dug on a lay without the pay streak—if any there be there—being located. Several weeks' work has been done, and there is nothing to show for it. True, the next shaft may strike a very rich streak, but in many cases the men become discouraged and throw up the lay.

"I might go on indefinitely enumerating the many disappointing features of this region, and the many reasons why it offers to the poor man no real inducements at all, but enough has been said already to set people thinking before staking everything on the chance of making a fortune in the gold fields of Alaska. I have talked with many old miners here, some of whom have spent long, weary years in the country, hoping at some time to stumble onto a fortune, but with very few exceptions—indeed, all—have found it impossible to make more than a 'grub stake.'"

UTAH.

(Special Correspondence) —The Silver King mine, at Park City, is proving a surprise to its owners, and particularly so to its original discoverers. It has been preeminently a silver property, but at its present depth, 1100 feet, it has cut into an ore body that is 100 feet wide, and is not yet cut through. It is producing $11 in gold, 300 ounces in silver and 65 per cent lead.

When the Lulu tunnel of the Mercur mine was started the values ran from $3 to $4 per ton, but they have steadily increased until the whole face assays $23.60.

Development of the property of the Bullion-Beck tunnel at Tintic is progressing.

The Treasure Hill M. Co. took a lease on Julian Lane group, Tintic, to December 1st, 1900.

Shipments from the Dragon mine, at Silver City, amount to forty tons a day.

The Southern Eureka, at Mammoth, is being prospected from the 500 level

The shaft on the Picnic at Park City is 425 feet and a crosscut is being run to tap the vein. A carload shipment was made in December.

The Uncle Sam mine at Eureka has opened a ledge said to be 100 feet wide.

Three assays from the Cleveland mine at Garden City showed $361.20, $20.80 and $9.50 gold. The highest and lowest were made from samples of the best and poorest ore, and the other from the general run of it. The body of ore is from 12 to 13 feet thick and was struck at a depth of 150 feet.

The Julia Dean at Bingham has opened a ledge from 6 to 12 inches that is said to run 63 per cent lead, 105 ounces silver and $3 gold.

The daily output of the Mercur mine is 300 tons.

The Butterfield Co., near Bingham, is shipping $20 ore.

The Mammoth at Tintic is shipping an average of ten carloads of high grade ore a week.

The Grand Central of Tintic averages a carload shipment every day, and the ore bodies continue to increase.

The Galena, at Fish Springs, shipped a carload of ore that showed at the mine 58 per cent lead and 108 ounces silver.

IDAHO.

The Geo. Smith mine, five miles from Salmon, shows a breast of ore 10 feet wide. It runs $9.90 per ton. A 10-stamp mill is in course of construction.

Men started work last week on the lower tunnel of the Granite at Wallace.

The Black Cloud, Banner and Granite are running crosscuts; the Custer, Atlantic and Silver Eagle are drifting on their leads; the Father Lode and Chloride Queen are taking out ore.

J. M. Davis has bonded the Hattie group at Hailey and put men to work.

The Tiger & Poorman Co. at Burke, during ten months, produced 15,819 tons of concentrates, worth $431,879.87 above freight and smelting charges, leaving a net profit of $139,044.69, or over $15,000 per month, exclusive of additions to the plant.

At Harpster, Rickards & Calkins uncovered a ledge carrying native copper, also showing gold values.

Mackay & Wedding are operating on a bar with good success, and the Lapwai Placer M. Co. is operating on Webfoot bar.

The Bedrock Dredging Co. of West Virginia purchased 250 acres of basin gravel near Placerville for $15,000. The company has expended $5000 in developing the ground. A dredge will be put in of 3000 cubic yards capacity.

A second ledge of good value has been opened in the Homestake mine near Boise.

The Last Chance mine has 1200 men on the payroll and last month the mine shipped 1200 tons of concentrates.

In the Cœur d'Alenes, the *Review* says local mining men are working their old mines to their fullest capacity and are spending thousands of dollars for new machinery and to develop new properties.

At Mullan, Larsen & Greenough, owners of the Morning and You Like mines, spent about $75,000 last year for improvements and now have the largest mill in the Cœur d'Alenes, with possibly one exception. Their shipments of concentrates for 1897 averages not far from 100 tons per day. From this it is figured that the profits are between $30,000 and $40,000 per month.

The Helena-Frisco has spent thousands of dollars in additions to their mill and development work, an average force of 100 men being employed in that work alone for six months, while the mill was shut down. The total expenditure preparing to make the mine a heavier producer was about $50,000.

When the Mammoth leased the Gem mill last summer it doubled its force, and its regular dividends presumably were increased accordingly, although a half-dozen men own it and do not take the public into their confidence to any great extent. It is known, however, that a dividend has been paid almost every month for years past, and so confident are the owners of continued success that it is practically decided that a mill will be erected, although no details have yet been perfected.

The Standard, commonly called the greatest mine in the Cœur d'Alenes, paid monthly dividends of from $25,000 to $75,000, with occasionally one running into six figures, until their big cave last fall, since when they have been running their mill less than half time.

The Tiger-Poorman, with the deepest shaft in the Cœur d'Alenes, and, consequently, the most expensive mine to operate, has cleared $15,000 a month above operating expenses, and counts that the 1400 feet which they have already sunk is not half the depth they can afford to work with the present grade of ore and price of product, while the ore now is decidedly better than any found in the first 1000 feet which they sunk.

At Wardner the Bunker Hill & Sullivan M. & C. Co. have bought all the adjoining properties which they could, and have spent $300,000 in improvements, and are working on their mill level tunnel—the Kellogg tunnel—which will run between two and three miles and cost $250,000, to cut their ore bodies 700 feet deeper.

MONTANA.

The properties of the Montana M. Co., fifteen in number, will be disposed of at sheriff's sale in Great Falls March 3rd.

Lamb, Dunwoody & Quirk, operating the Butte, at Radersburg, are shipping a car of ore every six weeks.

Work has been suspended for a few months on the new Parrot smelter at Gaylord, Madison county. Rumors that the company had sold their unfinished plant to the Anaconda Co. and that the latter would complete it and perhaps add largely to its capacity are unfounded. On March 1st work will be resumed at Gaylord and the smelter completed at the earliest date practicable.

The Philipsburg *Mail* says the Sinate mine in the copper district has been bonded to an Anaconda company for $200,000.

The average daily shipment of ore from Bear mountain the past week was fifteen tons.

J. D. Fletcher has secured a lease on the claims and plant of the Royal Gold mine and and plant at Philipsburg. They will begin operations immediately.

It has been computed by a Helena smelter man that the quantity of sulphur being discharged into the atmosphere in Butte alone amounts to 126,000 tons of pure sulphur per annum. The value of this material, when put into a marketable form, is $20 per ton in New York, so that the value of this sulphur, if it could only be collected and laid down in New York, would amount to $2,500,000.

MICHIGAN.

The Franklin Junior is sinking two double-compartment shafts from which, after sufficient openings underground, it will be possible to take out 1500 tons of rock per day. It is the intention of the company to build a stamp mill with a capacity to treat 1500 tons of rock per day.

MISSOURI.

Two miles from St. Clair the lately organized St. Clair Lead Mining Co. has begun mining operations. The Turkey Hill Mining Co. has a property at Moselle, six miles from St. Clair.

In southeast Missouri the largest new lead mining enterprise under way is that headed by D. P. Doak, president of the Missouri Smelting Co., St. Louis. The projectors of this enterprise have acquired 30,000 acres of land in the disseminated lead district in St. Francois and Madison counties, and will put three diamond drills at work to discover the extent of the ore body. The property is situated in a part of the State where mining and connected operations require a large investment in power, hoisting and concentrating machinery. Mr. Doak figures that the enterprise involves an expenditure of $300,000 or $400,000 for equipment of this kind, and says the outlay will be made. The St. Joe Lead Co., operating in the same section and on ore of a like character, has probably $2,000,000 or more invested in a plant.

ALABAMA.

(Special Correspondence.) -The table containing statistics of mineral production of Alabama during 1897, recently sent out from this office, was vitiated by an error in copying, and additional returns have been also received since that table was prepared. It is therefore requested that the following figures be substituted for those of the table originally sent you. EUGENE A. SMITH,
State Geologist and Sec. Ala. Ind. & Sci. Soc.

MINERAL PRODUCTION OF ALABAMA—1897.

*Coal, short tons	8,868,271
*Coke, " "	1,381,252
†Pig iron, long tons	923,895
†Iron ore, " "	3,241,846
†Limestone " "	494,655
‡Bauxite, " "	10,583
†Building stone, cubic feet	80,000

*From returns made to Chief Mine Inspector Jas. D. Hillhouse.

†From returns made to State Geologist and Sec. Ala. Ind. & Sci. Soc.

‡In addition to the above, Alabama should be credited with about 2500 tons of bauxite hauled in wagons from mines in Alabama to Cave Springs, Ga., and shipped thence by rail and credited to Georgia.

University, Ala., Feb. 7th, '98.

COLORADO.

A shipment of low grade ore from the Anna J. at Cripple Creek gave $30 per ton.

A number of new properties started the past week on Bull and Battle mountains, Victor.

Clemons & Frank of the Six Points are shipping a carload a day of $40 ore.

The Talc mine at Yankee Hill has a shaft 50 feet with 18 inches of copper-iron ore. The ore runs $17.30 per ton.

Trowe & Morrison have driven their tunnel on the Ironsides, near Eldora, 60 feet and have 40 inches of vein matter.

M. Scruggs has sold the Hazel Grace for $500.

N. McDaniel & Co. purchased the Village Belle at Eldora for $40,000, and are working two shifts sinking the shaft.

In a drift from the bottom of the 45-foot shaft in the May Queen at Cripple Creek are 10 inches of two-ounce ore.

The Vaughn, Cripple Creek, is shipping seventy-five tons of ore every week. The Fox is making daily shipments.

Miller & Co. at Cripple Creek have a vein of which 16 inches averages from $65 to $85 per ton.

Crow & Swarez are starting the St. Patrick under a twenty-months lease and a bond for $60,000.

The Legal Tender at Victor struck a vein studded with cubes of sylvanite, and the ore is of a much higher grade than anything yet opened in the mine. Assays range from $300 to $400.

The first shipment from the Black Girl at Ouray, consisting of two cars, was made last week.

W. O'Brien of the Center last week shipped a car of ore.

Twelve 25-ton cars were loaded at Leadville last week from the Yak tunnel.

J. D. Murphy & Co. are hoisting lead ore from the Weir shaft on the Nisi Prius.

Hoffman Bros., in the Daisy near Marble, are taking out ore that returns 160 ounces in silver, $12 in gold and 12 per cent copper. They have about 2 feet of this ore.

The Resurrection mine at Leadville is shipping 1500 tons per month of good grade ore. The mine is in the neighborhood of 800 feet in depth.

The Commodore at Creede has 300 men on its payroll.

The Modoc at Cripple Creek made a three-car shipment last week, one of them being of high grade. Returns from ten tons of first class shipped the previous week gave a value of $1000 a ton.

A recent shipment from the Gold Sovereign, Cripple Creek, contained ten tons of $300 ore, eight of $6, and 12 tons of milling grade.

Potvin & Vane shipped twenty tons of 4-ounce ore.

The Mount Albert Co. is driving a large tunnel at Twin Lakes.

The last shipment from the Pharmacist gave two and a half tons of sacked stuff a value of $620 a ton.

The Colorado mine at Ward was sold last week to Senator Tabor and associates for $35,000.

In the Richmond at Central City the vein is 3 feet wide and averages $40 per ton.

A 4-foot vein of iron has been opened in the Sherman lode, near Central City, carrying some free gold.

The crosscut tunnel on the Occidental, at Silverton, is under ground 102 feet, with 150 feet more to drive to cut the lead.

L. Wyman has resumed operations in his tunnel, at Silverton, 1000 feet under ground.

A. Dyatt has commenced operations on the old Tucson shaft of the Iron Silver M. Co. at Leadville.

McCarty & Lomeister are sinking on the Oro City claim at Leadville.

In the I. X. L. mine, in the new camp of Wall Street in Boulder Co., they have a shaft 65 feet deep, one tunnel 400 feet and another 600 feet. A crosscut 20 feet near the breast of the long tunnel is to be extended at once to a distance of 50 feet, at which point, according to a recent survey, it will tap the ore shoot immediately under the shaft and 300 feet from the surface.

Silverton *Standard*: The suit of Samuel Lesem against J. S. Updegraf in Division I of the District Court is concluded and judgment found for the plaintiff for $2196—the value of the machinery in the Veto mine, Clear Creek county. The court's decision is upon a point never raised before in this State. It establishes for the first time that where a man takes a mining property under a bond and lease with nothing expressed as to what shall be done with the machinery for exploitation, such machinery belongs to the lessee, and the latter had a right to remove it at any time during the life lease; and if the lease be forfeited for any reason, he can remove the machinery within a reasonable time after such forfeiture.

NEW MEXICO.

The Peerless mine, on Red river, will at once be reopened.

A. Conrad is striking good ore in development work on the Betsy, near Bland.

Wilson & Bruce are making headway in the lower level of the Crown Point mine, at Bland.

The Simpson smelter, at Copper Flat, is again running. The Hanover mine is working thirty-five men, and turning out sufficient ore to keep the smelter employed.

The Gilchrist smelter in Santa Rita was started last week.

The Pacific has opened an ore body at the 500 level which extends 2800 feet along the vein. The ore ranges from 1 foot to 5 feet in thickness, and gives returns from half an ounce to seven ounces gold per ton.

The 100-foot mark was reached in the Cotton tunnel, at La Belle. The greatest depth to be gained is 1000 feet. Besides the sixty-five acres of leased ground covering the site, this tunnel will develop the mineral hill west of camp on which is located the Louise, 50 feet of tunnel; the Senator Vest, 150-foot tunnel; the Boston group, 100-foot shaft; the Criterion, 70-foot shaft; the Victor and Oro of the Hudson Co., 50-foot shaft, all of which claims have returned assay values ranging from $3 to $15 per ton.

ARIZONA.

(Special Correspondence).—The Vulture mine, fifteen miles west of Wickenburg, will resume operations soon. The new company is planning to open the mine by new workings. This property, which is credited with a production of several million dollars, was foreclosed by some of the present owners on a claim of about $17,000. The tailings at the old mill were estimated to be worth, at the time of the foreclosure, $100,000. At present a cyanide plant is working profitably on these tailings. Ex-Senator Tabor of Colorado has a recognized interest.

The Santa Maria Mining Co., on the Santa Maria, west of Congress, is operating a 10-stamp mill and cyanide plant.

During the past year the Congress mine has worked about 40,000 tons of ore, milled and concentrated on the ground and the tailings roasted and cyanided.

The Golden Wave mine, two miles from Congress, is being developed. The ore bears a similarity to that of the Congress. A 30 H. P. gasoline engine operates a hoist and air compressor. A mill is to be put up at the mine.

The mines at Chaparral and Big Bug, twenty miles from Prescott, are in operation. Farther south, in the Bradshaw mountains, the snows have retarded work. A railroad will be built this year from Prescott to Chaparral, Big Bug and points in the Bradshaw mountains. This line will quicken the pace of progress in those districts near Prescott, whose merits are beyond question. The road, while it will bear a different name, has the Santa Fe, Prescott and Phœnix Co. behind it, and will be up to date and its management enterprising. It will greatly aid in developing mining resources from Prescott to the Bradshaws and from the Rio Verde to the Hassayampa. WASCOTT.

Congress, Ariz., Feb. 8th, '98.

The Mexican Sulphur Co., fifteen miles below the mouth of the Hardy-Colorado, with offices in Yuma, is quarrying sulphuric material, employing fifty men. So nearly pure is the ore that the assistance of water is needed to extinguish the flames that spring up after each blast. Even the concussion of the miners' tools occasions combustion. Beside the sulphur being taken out, a vein of alum 2 feet in width, encountered in the same deposit, is being shipped.

Development work on the Jaynes mines, at Picacho, has been resumed. These mines have been worked to a depth of 200 feet. It has been decided to erect a cyanide plant. F. Guerra is the Supt.

The vein on the Fresnal claims has an average width of 15 feet, all pay ore. On the hanging wall a stringer 18 inches in width is said to run in the streak as high as $900 in gold

and $127 in silver. Development work evidences no weakening of the ledge in strength or value. The property is in the Baboquivari mountains, seventy-five miles southwest of Tucson.

The Saginaw Co., in Pima county, in crosscutting, opened a vein of ore carrying 150 ounces silver and one ounce gold. The vein is 3½ feet wide.

F. A. Smith closed a deal for Michigan parties by purchasing the Centennial group in the Gijuas district, out from Tucson. The company contemplates erecting a 20-stamp mill at once.

The South Bisbee Copper Co. has fifty mining claims in the heart of the Bisbee mineral basin.

Supt. Guerra has resumed development work on the Jaynes mines. They have been worked to a depth of 200 feet. It has been decided to erect a large cyanide plant for the reduction of these ores.

During December and January Clack Bros. took out $12,000 from the Oro Plata, northwest of Kingman. Ore now taken out shows 200 ounces silver and from fifteen to twenty-five ounces gold.

The Evans Van-Hecke Co. started their additional ten stamps at Evans Point last week and now have twenty stamps in operation. The company contemplates adding fifty more stamps.

In the Gladiator mine, Yavapai county, a 30-inch vein of gold quartz was encountered which goes six ounces to the ton.

The Detroit Copper Co. of Morenci has resumed operations.

J. Cronin has commenced the development of the El Dorado mine in Mojave county and is erecting a 10-stamp mill.

Judge Hawkins of Prescott has bonded six claims in Mojave county to a syndicate of Denver capitalists, who will immediately develop them. The propositions involve gold, silver and lead.

The *Southwest Bullion* says that the Copper Queen Co., of Bisbee, has acquired all the copper mines, hoisting and reduction works and railways of the Detroit Copper Co., at Morenci, near Clifton, and also a group of mines at Nacosari, in Sonora, which are being opened on a comprehensive scale, and to which the company contemplates extending its Benson-Bisbee standard railway.

Nine claims and several hundred tons of copper ore on the dumps were bought by the South Bisbee Co. for $30,000.

The Copper King shaft is down 540 feet, and sinking is being pushed.

A new strike of copper ore was made on one of the claims of C. A. Overlock, uncovering a 5-inch vein of copper and silver ore that will run 40 per cent copper.

Doyle & Dougherty of Tucson from fifteen tons of ore from their mine on the summit of Helmet received pay at the rate of 420 ounces silver and $70 gold per ton.

The Spencer Bros., Tucson, sold the Cabriza mine for $5000. A binding sum of $500 was paid down.

MEXICO.

In the Creston mine at Minas Prietas a vein of high-grade ore was cut on the eighth level.

SOUTH AFRICA.

In the Nourse Deep the first output during period Nov. 17th to Dec. 31st is: Number of stamps working, 60; number of days working 60 stamps 39; ton crushed by 60 stamps, 9428; yield in smelting gold from mill, 3882 ounces; tons of sands and concentrators treated by cyanide works, 4753; yield in smelting gold from cyanide works, 2217 ounces; total, 6099 ounces. Working expenditure and revenue: Sixty stamp mill and cyanide works, 9428 tons milled; to mining, milling, cyaniding, and general charges, £16,725; to profit, £5216—£21,941; by gold account, 3882 ounces from mill, £13,977; by 2217 ounces from cyanide works, £7946; by other revenue, £318—£21,941; expenditure on account of capital, £5943; value of yield per ton, £2 6s 6 53d; working cost per ton, £1 15s 5.75d; profit per ton, 11s 0.78d.

A writer in the Bloemfontein *Express* says there are 75,000 ancient gold mining holes—for they are never shafts—in Rhodesia, and he reckons that allowing only 10 dwt. to the ton, the ancients must have taken £1000 worth of gold on an average out of each, or £75,000,000 in all; and with our machinery he thinks there is at least as much left for the moderns.

AUSTRALIA.

The following is an extract from a private letter from Kalgoorlie from a mining expert now visiting that section: "This is going to be one of the leading gold-producing centers of the world. The first thing that strikes one is the enormous figures they talk about, and when I tell you that the last division of profits for six months in the Lake View Consols was £150,000, on a capital of £250,000, you will understand their having something to go upon. Callaghan, the manager, told me that his crushing this month would total some 15,000 ounces, and that when their water arrangements are completed he can quadruple the output."

The Broken Hill Proprietary half-yearly statements issued show a profit for the six months ending Nov. 30th, 97 of £111,128. The net assets amount to £531,396, and the profit and loss account shows a credit balance of £597,520. The amount expended under the heading of construction is £72,000. The average price obtained during the half year for lead was £12 7s per ton, and for silver 2s 2 9-16d per ounce. 181,716 tons of ore were treated.

SIBERIA.

A Tomsk telegram states that about Jan. 25th a lump of auriferous earth, containing 74¼ pounds of pure gold, was found in the gold washings on the Spasso Preebrashenige estate in the Minusinsk district.

WANTED.—Position to take charge of a quartz mine. Am a practical miner, and have had charge of a number of properties in different States for the last 20 years. Can furnish the best of reference. Address J. D., Mining and Scientific Press.

MINING ENGINEER

Of experience desires engagement as superintendent, or to open mines, or to exploit mining properties. Address "ROBERTS," Mining and Scientific Press, San Francisco.

Position as Manager or Superintendent of Mines and Mill.—A mining engineer of 20 years' practical experience in mining, milling and placer mining, understands construction and operation of stamps, Huntington's and roller mills, amalgamation and concentration to any degree of fineness with jigs buddles, vanners, bumpers, and Wilfley tables; makes surveys, maps and plans of mines and mills, and does practical assaying; experienced in handling free gold, and sulphurets of iron, copper, lead, zinc and quicksilver; can examine and report on mines; will be open for engagement about March 1, 1898. Box 30, Mining and Scientific Press.

LEVIATHAN BELTING

WHICH FOR STRENGTH AND TRACTION POWER HAS NO EQUAL.

Especially Adapted for
MINING MACHINERY
AND
MAIN DRIVING BELTS.
It Is Unaffected by Water, Heat or Steam.
EVERY BELT GUARANTEED.

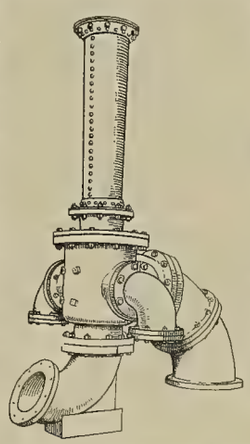
The Eureka Company,
OF SAN FRANCISCO.
ROOM 1, - 426 CALIFORNIA STREET,
SAN FRANCISCO.

Reasons Why Inventors Upon This Coast Are Advised To Consult With Us:

First: Because they have the opportunity to explain their inventions personally and directly to the men who write the specifications and make the drawings, so that they will get all the inventor's ideas correctly and not be liable to make mistakes.

Second: In addition to this we have resident attorneys in Washington, of long experience and high standing with the office, who attend EXCLUSIVELY to our business before the Patent Office. You have, therefore, the advantage of personal consultation in the preparation of the case, and constant attention to your application after it has been filed.

Third: Time is saved. If you send to an Eastern attorney you must depend upon your ability to write a perfect explanation to a person three thousand miles away, wait until the papers can be returned to you for signature, and then send them again to your agent to be filed, if they are fortunate enough not to need further revision and return.



Experience in preparing patent applications here and in the East has proved to us that superior work can be done here.

We have been credited with obtaining more patents in proportion to the number of applications made by us than any other firm in the business.

We have had a continuous experience in this business of over thirty years. We have the most complete Patent Library west of the Mississippi river, including full certified copies of all patents issued for the past twenty-five years. We keep these for free examination by any one who desires.

We attend to all business connected with patents, such as the preparation of Caveats, Trade-Marks, Design Patents, Assignments, Licenses and Agreements. We make examinations as to the patentability of inventions, searches and opinions as to infringements, or the scope or validity of Patents. Our Branch Offices and arrangements for Foreign Patents, Trade-Marks, etc., are very extensive and complete.

DEWEY, STRONG & CO.,
330 Market St., San Francisco, Cal.

Evans Hydraulic Gravel Elevator,

—MANUFACTURED BY—

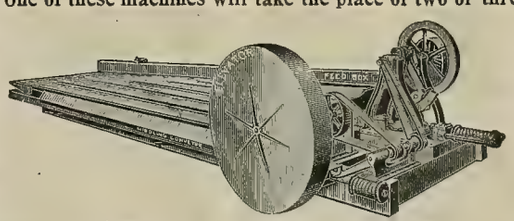
THE RISDON IRON & LOCOMOTIVE WORKS,

SAN FRANCISCO, CAL.

The cheapest and most efficient Gravel Elevator made.
It will do more and better work than any other Gravel Elevator.
It is fully protected by United States and Canadian letters patent.
It infringes no patents, any statements to the contrary are false and made to mislead intending purchasers.

WHITE, ROGERS & CO.,

Constructing Engineers and Contractors,



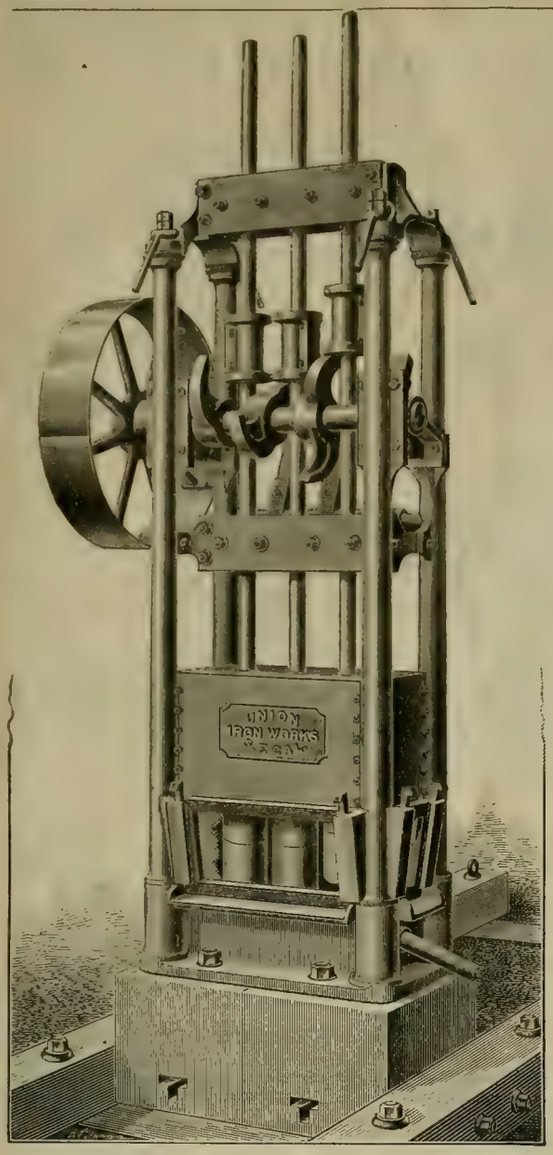
Offices: 306 PINE STREET, SAN FRANCISCO, CAL.

Sole Pacific Coast Agents and Builders of the Celebrated

WILFLEY CONCENTRATOR.

PRICE $450 F. O. B. San Francisco.

One of these machines will take the place of two or three belt concentrators of any style and do very much better work.



WILFLEY CONCENTRATOR.

We furnish superior Machinery and erect Stamp Mills, Hoisting and Pumping Works operated by Steam or Water Motors. Complete Concentrating and Smelting Plants for the concentration and recovery of gold, silver, copper and lead. Improved Power Drills and Air Compressors, Wire Rope Tramways, etc.

"Union" Hoist.

The above cut represents our 10 h. p. Double Cylinder Engine of latest type, and Hoist combined on strong iron base. This hoist is designed to raise one ton 125 feet per minute from an inclined shaft, or 1500 pounds at the same speed vertical lift. The drum will hold over 600 feet of ⅝-inch cable. The outfit weighs 3500 pounds.

THE UNION GAS ENGINE CO.

—BUILD THE—

"Union" Gas Engines,

Which use either Manufactured or Natural Gas, Ordinary Stove Gasoline (Naphtha or Benzine), Distillate or Kerosene.

STATIONARY ENGINES for All Kinds of Work, Built in Sizes from 3 to 200 h. p.
"UNION" COMBINED HOISTS in Sizes from 2 to 40 h. p.
"UNION" COMBINED COMPRESSORS—20, 30, 40 h. p.
HOISTS and COMPRESSORS Can Be Built in Larger Sizes to Order.
"UNION" MARINE ENGINES, 4 to 200 h. p., of Single, Double and Four-Cylinder Types.
TEN YEARS' EXPERIENCE Building Gas and Oil Engines.
"UNION" ENGINES Are In Use All Over the United States.
"UNION" ENGINES Are Simple, Durable and Economical.

Pacific Placer Machine.

Patented APRIL 20, 1897.

KLONDIKE MACHINE.—If you are going to placer mining in Klondike or any other country, you cannot afford to be without one of these Machines. It will work any class of placer ground, river or sea sands, and save the fine float gold as well as the coarse. The material is graded in four different grades in passing through the Machine. The coarse gold is caught in the riffles above the plates; a double screen is arranged above the plate and amalgamating cylinder, allowing nothing but the water and fine material to pass onto the amalgamating plate and cylinder. This is the Machine for dry countries, as it requires but a small amount of water. By attaching one of our small pumps the Machine will supply its own water from streams or well and raise water 20 feet. One miners' inch of water will supply our larger Machine by using the water over. Will work 40 to 50 tons per day. Can be run by hand or power. Built in three sizes. Price $150, $300, $450, f. o. b. S. F. Capacity 10, 25, 40 tons per day. Weight 175 lb, 400 lb, 550 lb. Manufactured for both quartz and placer. Send for Catalog. PACIFIC MINING MACHINERY CO., 127 First St. S. F., Cal.

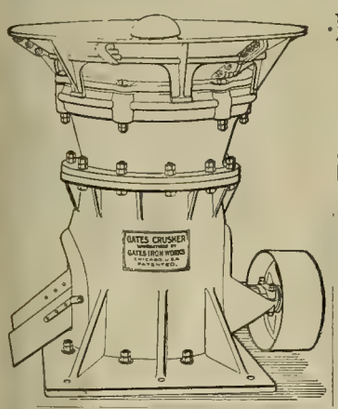
A REVOLUTION IN FREIGHTING.

THESE WAGONS ARE ESPECIALLY ADAPTED FOR STEAM FREIGHTING; CAPACITY OF TRAIN 50 TONS.

"The Daniel Best" 50-Horse Power Traction Engine.

The most powerful and only Successful and Practicable Road Engine in the World. Over sixty of them in use in this State, and they are being Successfully and Profitably Employed in Hauling Logs Lumber, Ore, Salt, Borax and other kinds of freight.



The work is being done **FIFTY PER CENT** Cheaper than it is possible to do with Animal Power. They can be operated over any ordinary road where it is practicable to use mules or horses, doing the same work. They can ascend or descend grades as much as 20 to 30 inches to the rod, hauling their loads of 35 to 40 tons, depending upon the condition of the roads; loads may be increased to even greater amount on moderately level roads.

Send for descriptive Circulars and price List of Wagons and Engine. We solicit correspondence. No trouble to answer questions.

Estimates made for complete Steam Freighting Outfits. Address

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will save inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address **DEWEY, STRONG & CO., Patent Agents, 330 Market St., San Francisco, Cal.**

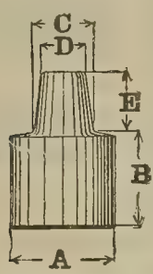
PATENTS

DEWEY, STRONG & CO'S PATENT AGENCY.



Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & CO.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

GOLD IN COLORADO!

Colorado has within its limits some of the greatest gold mines that has ever been discovered. In Cripple Creek in 1892 there were a few prospectors looking over the hills; in 1895 the camp turned out over $8,000,000 in gold. Leadville, the old bonanza camp and the mineral product of which made Denver what it is to-day, is becoming a big producer of gold. New inventions for working low-grade gold ores, together with the discoveries made to work rebellious ores, have opened up a field for the miners such as they have never enjoyed before, and Colorado has inducements to offer such as no other district in the world possesses; the record of the State in gold production for the last three years speaks for itself. Among the other prominent camps in the State are Telluride, Ophir, Rico, Silverton, Mineral Point, Durango, La Plata, Ouray, Saw Pit, Ironton, the Gunnison district and many others. New finds are being made and new camps are springing into existence every day. The Denver & Rio Grande Railroad, which is the pioneer road of Colorado and which has always been the miner's friend, reaches all the mining camps in Colorado. For elegantly illustrated descriptive books, free, of mines in Colorado send to

Assaying.—Part I—Gold and Silver Ores.

Third edition; Just Out. Rewritten and Improved by the Author, C. H. Aaron. Embraces 130 12-mo pages, with illustrations; well bound in cloth; 1896. Price, postpaid.....$1 00

Assaying.—Parts II & III—Gold and Silver Bullion, Lead, Copper, Tin, Etc.

Latest edition. Contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter. Price, postpaid.....$1 75

Prospector's Field Book and Guide.

By H. S. Osborn.....$1 50

Roasting of Gold and Silver Ores and the Extraction of their Respective Metals Without Quicksilver.

Second edition. By Guido Kustel, M. E. Contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. Price, postpaid.....$3 00

Modern Copper Smelting.

By Edward Dyer Peters, Jr. Eighth edition. Rewritten and enlarged. Profusely illustrated....$5 00

Practical Treatise on Hydraulic Mining.

By Aug. J. Bowie, Jr. On the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. Price, postpaid.....$5 00

Practical Hydraulics.

A book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers and Irrigators. By P. M. Randall. Contains useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulæ, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules and tables are prepared. Is specially applicable to the Pacific Coast. Price, postpaid, $2

The Explorer's and Assayers' Companion.

A third edition of selected portions of the "Explorer's, Miner's and Metallurgist's Companion." By J. S. Phillips, M. E. A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying and Metallurgy. Price, postpaid.....$6 00

The Metallurgy of Gold.

By M. Eissler. Profusely illustrated.....$5 00

Cyanide Processes for Gold and Silver Ores.

By E. B. Wilson, E. M. 12mo., cloth.....$1 50

Quartz Operator's Handbook.

MINE BELL SIGNALS. Adopted, Used and in Force in Accordance with State Law.

FOR THE CONVENIENCE OF OUR READERS IN THE MINING COUNTIES WE PRINT IN legal size, 12x36 inches, the Mine Bell Signals and Rules provided for in the Voorhies Act, passed by the State Legislature and approved March 8, 1893. The law is entitled "An Act to Establish a Uniform System of Mine Bell Signals to Be Used in All Mines Operated in the State of California, for the Protection of Miners." We furnish these Signals and rules, printed on cloth so as to withstand dampness, for 50 cents a copy. MINING AND SCIENTIFIC PRESS, 330 Market St., San Francisco.

Market Reports.

The Markets.

SAN FRANCISCO, Feb. 17, 1898.

The demand for goods from up north is quite heavy, particularly for lines suitable or destined for Alaska and the Northwestern Territory. In this city liberal supplies are being sold to persons going to the gold fields up there, which adds largely to the general call for goods. There is an improving call from California, which would be still more pronounced if we have a good soaking rain throughout the State. While private advices report crops in about every section looking well and not suffering for rain, still an absence of rains for two to three weeks would prove quite disastrous to many localities. Jobbers seem to be waiting for weather development before pushing for trade in the agricultural districts. There is a stronger tone to the different lines of goods. In metals the markets at the East have been strengthening for tin, copper, lead and spelter, which creates a better feeling in them here.

The local money market is dull and inactive, with a plethora of funds in bank. There is nothing that indicates a speculative movement at hand in anything, while the steady shipments of products out of the State unties money which adds still more to the available funds. The disbursements in this city and up north by persons going to Alaska aggregate a large sum every week. It is stated that collections, while not free, are not close, there being very little friction. With water again available for mining purposes, freer receipts of gold bullion and gold dust are looked for from now on. The Australian steamship brought in over $2,500,000 in English sovereigns, which will be remitted and made available for circulation. This gold comes here in the usual order for exchange purposes. The East reports easy money markets in about every direction.

New York Silver Prices.

NEW YORK, Feb. 17.—Following are the closing prices for the week:

	Silver in London.	Silver in N. Y.
Friday	.26	56⅜
Saturday	.26	....
Monday	.25 15-16	56¼
Tuesday	.25 13-16	55⅞
Wednesday	.25⅞	56⅛
Thursday	.26	56¼

	Copper.	Lead.	Iron.	Tin.
Fri.	10 00 @11 15	3 77½	10 00@12 00	13 97½
Sat.	.... @....	.... @....	....	....
Mon.	11 20 @11 30	3 85	10 00@12 00	14 05
Tue.	11 20 @11 30	3 85	10 00@12 00	14 10
Wed.	11 25 @11 30	3 82½	10 00@12 00	14 05
Thur.	11 25 @11 30	3 82½	10 00@12 00	14 00

The local bullion, money and exchange quotations current are as follows:

Commercial Loans, % per annum	6
Commercial Loans, prime	5
Call Loans gilt edged	4@4½
Call Loans mixed securities	5@6
Mortgages prime, taxes paid by lender	6@8
New York Sight Draft	17½c Prem
New York Telegraphic Transfer	20c Prem
London Bankers' 60 days	$4.83½
London Merchants	$4.81½
London Sight Bankers	$4.85½
Refined Silver, per oz., 1000 fine	56½
Mexican Dollars nominal	46@—

SILVER.—The markets at the East and abroad have ruled heavy throughout the week. This, it is stated, is largely due to political complications and to the fear that an international war may be precipitated at almost any time, so strained are the relations between some of the countries. The inability of China to float another loan has something to do with the inactivity. The last steamer hence for Hong Kong took out $140,000 in bullion.

MEXICAN DOLLARS.—The market is slow and easy at quotations. The steamer hence February 12th for Hong Kong took $54,618 worth.

COPPER.—Our market is strong at quotations in sympathy with higher prices at New York. That market moved up the past week owing to an active export demand. This had been looked for to follow the settlement of the engineers' strike in England and also the opening of spring business. In this country there is a good consumption, which seems to be enlarging.

Our market is quoted as follows:

Ingot casting, jobbing	—@13
Ingot " wholesale	—@12½
Sheet copper	—@16½
Bolt ¼ and 5-16, 20c; ⅜ and larger, 16½	

TIN.—The market in Europe for pig strengthened the past week, which caused a firming up at New York. The cause of the improvement is said to be due to a good demand from this country and no excessive stocks to draw from. The attempt to form a tinplate trust at the East has proven a failure, and as more factories are starting up it looks as if it will be still more difficult to control them. In our market there is an improving demand.

The market is quoted in jobbing lots as follows:

Pig, per lb., jobbing	—@ 15
Plate, I C coke, heavy, per box	$4 10@4 25
" " light, "	4 00@—

LEAD.—The market is strong at full quotations, with an advance looked for if the East moves up still more. The advance at the East is due to an active near-by call and firmer holding. European markets are no higher.

Pig	4 75	@	5 00
Sheet	....	@	6 50
Pipe	5 30	@	5 80

QUICKSILVER.—The market is steady. Shipments the past week by water to foreign ports aggregated 16 flasks to Victoria, B. C.

Our market is quoted at $39 for domestic consumption and $35@36 for export to the west coast of Mexico.

IRON.—The market is practically unchanged so far as prices are concerned, but the consumption seems to be increasing. The East reports an active home and export movement, but the supply is ample. The late advance of 50 cents for Southern is still asked, but so far as we can learn it is not paid.

COAL.—There appears to be an easier tone to the market, due to a higher temperature, lessening the demand for house coals, a falling off in the demand for steam, and free receipts by water and rail. The decision by the United States Circuit Court against the coal combine opens this market for the marketing of coal from mines heretofore excluded. Receipts of coal for the week ending with Tuesday were as follows in tons: Departure Bay, 4941; Sydney, 3047; Nanaimo, 9144; Puget Sound, 6100; Coos Bay, 400; Newcastle, N. S. W., 1030. Total, 24,622 tons.

BORAX.—There is a good demand from the East where supplies are reported light. The market is quoted as follows:

Refined, in carload lots, in barrels	7
Refined, in carload lots in sacks	6¾
Powdered, in car lots	7
Concentrated, "	6¼

ANTIMONY.—The market is steady.

POWDER.—The market is steady at current quotations.

The market is quoted as follows for Hercules: No. 1, from 11¾c to 17¼c, according to strength and quantity; No. 2, from 9 to 11c, according to strength and quantity.

PLATINUM.—The market is steady.

Our market is quoted in a jobbing way at $16 per ounce and for scrap $11 an ounce.

ZINC.—The market is steady.

Our market is quoted at 10 to 15 cents, according to thickness.

ALUMINUM.—The market is steady.

We quote in jobbing lots at 45 to 50 cents per pound for ingots.

Chemicals.

There is absolutely nothing new to report in our market. The changes in quotations heretofore looked for seem to be about as far off as ever. The Eastern markets are similarly conditioned, for New York advices report nothing out of the ordinary line of business or demand developed in any branch of the market; but general distribution, particularly of the lighter goods that figure anywise prominently in the jobbing branch of the trade, is of quite good volume and up to the average. Prices remain substantially as quoted for some time past.

CYANIDE OF POTASSIUM.—The market is steady.

Our market is quoted for chemical pure 32 cents per pound for jobbing lots, and 29 cents for carloads.

SULPHURIC ACID.—The market is firm.

We quote in a jobbing way at 1¾c per lb for 66%.

ACETIC ACID.—The market is firm at 6 to 12c per pound from store for carboys, according to make.

NITRIC ACID.—Our market is reported steady from store at 6½@7c per pound in carboys.

BONEASH.—There is a fair demand.

Our market is quoted in a jobbing way as follows: Extra, 4c a pound; No. 1, 3¼c; No. 2, 2½c.

BLUE VITRIOL.—Our market is steady.

We quote in a jobbing way at 4c per pound.

SPELTER.—The market is steady.

We quote our market in a jobbing way at 5 cents a pound.

BISMUTH.—The market is firm.

Our market is quoted in a jobbing way at $1.40 a pound.

SODA ASH, 58% (LeBlanc process).—The market is steady at $1.55 per 100 lbs. in a jobbing way.

CAUSTIC SODA, 60%.—The market is steady at 3c per pound in a jobbing way.

HYPOSULPHATE OF SODA.—The market is quiet at 2½c a pound from stores.

NITRATE OF SODA.—The market fluctuates for round lots, but is steady for small.

Our market is quoted from store at 4c for 95%.

PHOSPHORUS.—The market is steady.

We quote in a jobbing way at 70 to 75 cents per pound.

Mining Share Market.

SAN FRANCISCO, Feb. 17, 1898.

The market has been more active, with a slight advance along the line. The first improvement was noted in Challenge, which was seconded by Caledonia farther south and responded to by Con. Virginia at the north. When the latter moved up the middles showed more strength, as did others at the north end. Con. Virgina moved up to $1.10 yesterday morning, but closed last evening at 98 cents, causing the entire list to ease off in sympathy. Street points are that the morning buying was by Virginia City people, as was the selling in the afternoon. As about all the orders sent from that place are done under instructions from San Francisco, it indicates that the market is being manipulated in the interest of a combination for a small bull movement. That they expect to be able to unload at quite an advance on current prices is emphasized by the work at several points on the Comstock lode, without regard to the strong probability of an important strike on the Brunswick. Before this takes place there will be quite a line of assessments levied commencing after tax-day—first Monday in March. These assessments may have a temporary bad effect if prices are higher, but if they are lower before levied the shading off, if any, may not amount to much. The heaviness of Sierra Nevada is said to be due to dead work being done, and the trading public gets out of inactive shares into the more active. From all that can be learned, the new work mentioned last week has not been started, or, at least, official letters do not so report, but it will be started, and more beside. The decrease in the flow of water in the long west crossdrift run jointly by Con. Imperial, Challenge and Confidence is accepted as favorable, but they strike another flow farther on before striking the west lode. This crossdrift drains a large area to the west. The Bodie district ought to come to the front before long and Standard renew dividends. This company is liable to pay 25-cent dividends before 1898 passes.

The news from the Comstock mines is of a more interesting character than for over a year. The dead work in several has been completed while in some of the others it is nearing completion, which means more active exploiting. The official letter from Utah does not report any material change during the week. In Sierra on the Riley tunnel level dead work seems to be the order. Some time in next week exploiting will probably be resumed. The work on the 900-foot level is unchanged. In Union nothing new is reported; the work is to the east and on the 900-foot level. In Mexican blocking out on the 1000-foot level is still the order. Work in Ophir is to the west on the central tunnel level and also 1000-foot level. On the latter they are in about 430 feet and on the former about 900 feet. They ought to be approaching more interesting ground. On the 175-foot level in Andes they are going in a northeast direction, consequently they are not apt to strike ore. We are not advised if they have started the new crossdrift on the 1650-foot level of Con. Virginia. The work in this mine is confined around the 1550-foot, 1650-foot and 1750-foot levels. They ought to be ready for more important work soon. They are raising a few tons of ore assaying about $41 a ton. The work by Best & Belcher and Gould & Curry is jointly to the east on the 800 foot Bonner shaft. They are going west in the Savage. No work reported in Hale & Norcross. In Chollar they are repairing the main west drift on the 450-foot level. On the 100-foot level they have started a west crossdrift. On the surface tunnel level of Potosi the south drift is in quartz giving low assays—$3 to $7 a ton. Bullion valued at $3165 has been shipped. In Alpha they are still upraising on the 500-foot level. What this work is being done for no one seems to know, except to spend money and kill time. The long joint west drift of Con. Imperial, Challenge and Confidence is in over 1800 feet. The flow of water is decreasing. In the Yellow Jacket they are still working one shift, so says report, but more men will be put on soon. In Crown Point they are still raising low grade ore for testing while doing other work. In Belcher the work is the same as reported last week. In Overman they are drifting north on the 900-foot level. A few tons of ore are raised. In Caledonia they are getting ready for more active work on the 1100-foot level. Reports say they have ore on this level which can be struck within a short time after they start for it. In both Justice and Alta the prospects are of quite an encouraging character. The managements of these two mines are quite hopeful of being able to develop paying ore in quantity.

From the Brunswick lode our advices are of a decidedly encouraging character in Occidental, Potosi and Best & Belcher, but it will take more work yet to fully establish expectations based on present showing. In Occidental they have found good ore 200 feet south from where the best showing was and on the 650-foot level 400 feet north. The ore is fair grade, averaging about $20 to the ton; and as the company owns its own mill, this will pay a good profit to extract and mill. The winze has been sunk in fair grade. They will crosscut the lode to find its width, after which sinking will be resumed. It looks as if the management is developing the mine as an investment proposition, and not speculation in shares. The south drift in Potosi, 600 foot level, is in favorable formation. In Chollar no change is reported in the work under way. Joint work is being done in incline shaft No. 1. They are down 1061 feet. A station will be cut out next month and work will begin to open another level. Joint work by Best & Belcher, Gould & Curry and Con. Virginia is confined to exploiting the 600-foot level. On this level they are drifting south for air connection and crossdrifting east and west. They are also sinking the main incline. In March they will be down far enough to cut out a station and open another level.

The following illustrates the changes for the week:

Mines.	Feb. 10.	Feb. 17.
Alpha	....	....

An Old Firm Dissolves.

The members of the firm of Morris & Kennedy, the well-known pioneer picture dealers of Post street, have dissolved partnership, Mr. Morris retiring. Mr. Morris has been the active manager of the firm for over twenty-six years and is responsible for bringing to the coast most of its better class of works of art, secured during his frequent trips East and to Europe. He contemplates resuming business on his own account, and after a short rest will leave for New York to establish connections and secure works of art of the highest character for the new venture.

TEN WEEKS FOR TEN CENTS!

Strange as it may seem, that big family paper, the *Illustrated Weekly Sentinel*, of Denver, Colorado, (founded 1890) will be sent ten weeks on trial for 10c.; clubs of six, 50c.; 12 for $1. Special offer solely to introduce the paper. Gold rings set with Rocky mountain gems are given free as premiums. Latest mining news and illustrations of grand scenery each week, also true stories of love and adventure. Address as above and mention PRESS. Write today; postage stamps taken.

Mines or prospects operated on contract to purchase, or under lease on fixed royalty or percentage.

Money loaned mines.

Mining companies organized, their property experted, financed and managed.

Mines, prospects, mineral lands, mining securities, contracts, bonds, stocks, leases and options bought and sold or negotiated

Examine mines, prospects and mineral lands as to their value, method of working and condition of their titles. Assay and chemical work done.

Alice E. Binckley	40	2	10 00
Caroline S. Townsend	18	20	100 00

And in accordance with law, and an order from the Board of Directors, made on the 29th day of November, 1897, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the corporation, 125 Beale street, San Francisco, California, on SATURDAY, the 29th day of January, 1898, at the hour of 1 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

H. H. MARTIN, Secretary.

Office—125 Beale street, San Francisco, California.

POSTPONEMENT.

By order of the Board of Directors the day of sale of the above delinquent stock has been postponed to SATURDAY, February 26th, 1898, at the same hour and place. H. H. MARTIN, Secretary.

Office—125 Beale street, San Francisco, California

DELINQUENT SALE NOTICE.

MARINA MARSICANO GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Sunny Hill, Shasta County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 12) levied on the 3rd day of January, 1898, the several amounts set opposite the names of the respective shareholders, as follows:

Name.	No. Cert.	No. Shares.	Amt.
L. P. Drexler	87	10	90
Leo Alexander, Trustee	85	17,990	1,619 10

And in accordance with law, and an order from the Board of Directors, made on the 3rd day of January, 1898 so many shares of each parcel of such stock as may be necessary will be sold at public auction, at the office of the company, 217 Sacramento street, San Francisco, California, on MONDAY, the 28th day of February, 1898, at the hour of 2 o'clock P. M of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale. CHARLES BOVONE, Secretary.

Office—217 Sacramento street, San Francisco, California.

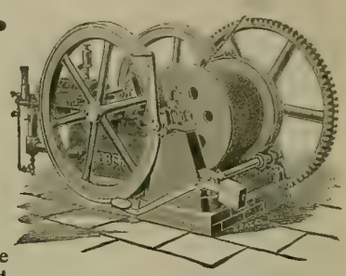
Lunkenheimer's "Clip" Gate Valve.

Single Disc DOUBLE SEATED. Made with Screw Ends from ¼ in. to 3 in. sizes.

BEST IN QUALITY.
LOWEST IN PRICE.
THE ENGINEERS' FAVORITE.

These Valves are made of cast iron and all wearing parts of gun metal. They are superior to the common cheap, brass valves with which the market is flooded.

WHY?



BECAUSE they possess all the advantages of a cast iron pipe fitting Elbow, Tee, Coupling, Union etc namely are heavy and rigid not injured by expansion and contraction or rough handling in pipe fitting. TAKE PRESSURE FROM EITHER END. Body and hub are held together by a steel clip consequently always easily taken apart. Joint between body and hub made permanent by an imbedded seamless oval copper wire washer. If you desire the BEST, STRONGEST and MOST DURABLE valve for general purposes on all ordinary pressures, use this valve. IT IS A STANDARD FITTING, OF NEAT APPEARANCE and FULLY WARRANTED TO SATISFY. Made also in All Iron for Cyanide Plants. Try them and be convinced. Specify them and order through your dealer. Our Catalogue of superior Steam Specialties, FREE for the asking.

CALIFORNIA STATE LIBRARY.

MINING AND SCIENTIFIC PRESS.
AND PACIFIC ELECTRICAL REVIEW.

No. 1964.—VOLUME LXXVI. Number 9. SAN FRANCISCO, SATURDAY, FEBRUARY 26, 1898. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

California Cheap Mining and Milling.

Recently was stated in these columns that quartz ore was mined and milled at the Spanish mine, Nevada Co., this State, for 60 cents per ton, illustrating the new era of mining where close figuring and economy prevail, as compared with the old style of the early days when nothing less than "$20 rock" was looked at. Nothing better illustrates the value of low grade ore and the permanency of the mining industry than authentic figures of actual cost of mining and milling. It is not theory but accomplished facts. Laboratory processes are not infrequent, but the actual tangible work resulting in profit from low grade ore is a species of proof most convincing. Another instance of what intelligent methods and good management can do under favorable conditions in mine production is afforded by the record of the Baliol Mining Co., at Sutter Creek, Amador Co., Cal., of which S. R. Porter is superintendent. Following are exact data of the work and cost of mining and milling gold ore at that property during the month of last April, during which time the mill was closed sixty hours:

COST OF MINING FOR APRIL.

534 days labor mining	$1,145 50
25 days blacksmith, sharpening	60 00
1275 lbs. powder	102 00
5 boxes caps	2 50
2200 feet fuse	11 22
30 days lighting, miners' candles	7 50
310¼ days labor tramming ore	647 12
30 days lighting, trammers' candles	7 50
5 gallons coal oil for lamps	55
Oil for cars	2 83
Total cost of mining and delivering 5885 tons of ore	$1,986 72

COST OF MILLING FOR APRIL.

118½ days labor on batteries and plates	$ 362 00
61½ " " " concentrators	168 00
44 " " " rock crushers	101 25
94 " " " ore bin	188 00
Mill repairs	161 27
Mill expense	60 12
Mill lighting	26 06
Power water supply for April	480 00
Total cost of running mill for April	$1,546 70
Cost of mining and delivering 5885 tons of ore	$1,968 72 or 33¾ cents per ton.
Cost of milling, do	1,546 70 " 26¼ " " "
Cost of mining and milling	$3,533 42 or 60 cents per ton.

It is to be noted that there was no special effort to make any record; the above was an ordinary 27½ days' work. The mill is a 40-stamp one, each stamp weighing 1000 pounds, with a four-inch drop, 102 drops per minute with a nine-inch die. It is also to be noted that forty stamps in 27½ days crushed 5885 tons of ore—an average of 5.35 tons per stamp per twenty-four hours—a high duty. The ore was excavated from an open cut 75x125 feet, from which it was dumped into a chute and trammed 700 feet to another chute, where it was again trammed 800 feet to ore bin at mill, the ore being handled twice and trammed a distance of 1500 feet.

The Saginaw Mines of Arizona.

Developments and improvements have been made during '97 at the Saginaw property, nine miles southwest of Tucson, Arizona. This property consists of twelve claims, encompassing portions of the foothills of the Tucson mountains, about 300 feet higher than the Santa Cruz valley, where the city of Tucson is situated. The location surprises those who are accustomed to mining in rugged formations at great altitudes. The ores of the Saginaw are mainly sulphides of iron and lead, largely oxidized on the surface. The values carried are chiefly gold, silver and lead. Returns range in value from $22 to $48 per ton. The property is being developed and worked from four different shafts, two of which are about 300 feet in depth. They are each sunk following the slight inclination of the vein. From each shaft crosscuts are run at different levels. There appear to be several ledges or veins paralleling each other, but which dip toward a common center, the local conclusion being that they unite at considerable depth. The vein matter opened in each of the four shafts is of the uniform value mentioned above.

The method of treating the ore of the Saginaw is exemplified by the plant of machinery there. It consists of a mill in operation and a smelter in course of construction. The mill consists of a No. 4 Gates crusher, three Huntingtons and six concentrators. The small smelting plant, which joins the mill, is being equipped with one copper and one lead furnace and a blower. The machinery is being run by a 95 H. P. Corliss engine. The property furnishes all the materials necessary for fluxes in the smelting process, including plenty of limestone.

The water supply is conveyed to the property by a pipe line from the Santa Cruz river, four miles distant, pumped into tanks above the mill and smelter, which are capable of storing 40,000 gallons.

SAGINAW MILL AND SMELTER NEAR TUCSON, ARIZONA.

This property, which is being developed and built up with unusual energy, is of considerable promise. It belongs to the Saginaw Mining Company, of which Capt. J. D. Burgess is general manager; Chas E. Thomas is superintendent.

Part of the company's holdings is 240 acres of placer ground, lying in the valley immediately below their lode claims. These claims are said to contain sand and gravel 4 to 8 feet deep, which carry values sufficiently high to warrant being worked with profit.

It has been recently held by a court of appeal that where litigation between rival companies interested in the same mineral deposits is incapable of satisfactory judicial determination a contract entered into between them in good faith, for the purpose of ending such litigation, whereby their rival interests are consolidated, the contract involving the purchase of other mines and plants in different parts of the country, such combination is not illegal, as tending to create a monopoly, the companies exercising no public franchises, but being simply the owners of a species of property which in its natural state is of no use to mankind, and their output comprising but a small proportion of the product of the country.

Regarding the recent ruling of the Interior Department and the General Land Office concerning the amount of work required on each mining claim before patent would issue, and the date when such order goes into effect, Commissioner Hermann states that all claims upon which work was done before December 15th, '97, will be approved. He also states that it will suffice if, in application for patent for a group of claims, work or improvements aggregating in value $500 for each claim can be shown to have been put upon the group as an entirety. Were $750 expended upon one location and $250 on another, jointly owned with the first, both would pass.

The Golden Jubilee Mining Fair.

The Golden Jubilee Mining Fair, which has been in progress in San Francisco since January 29th, is a financial success. It is believed to be the first exposition in the world's history devoted entirely to a display of mining machinery, ores and supplies, and has been seen by many thousands. The prominence of the mining industry, the 50th anniversary of the discovery of gold in California, and the present Klondike excitement were among the inducements to have such an exhibition in the coast metropolis at this time, and the opportunity has been improved. During this week there have been several drilling and wrestling contents that have attracted unusual attention. During the fair there has been considerable oratory. On University of California Day, Feb. 19, S. B. Christy, of Berkeley, Cal., Professor of Mining and Metallurgy of the University of California, spoke as follows:

Mr. President, Ladies and Gentlemen, Pioneers and Miners of California:—In the name of your University I come to you greeting! And first I bring one more leaf for the laurel crown of our new-world Argonauts. Half a century ago they sought once more the Golden Fleece, their faces all aglow with the bright hopes of youth. The fires of youth burned out, but their courage and their manly strength won for us our birthright, beloved California! California, the land of blue skies and golden sands, of purple grape and vine clad hills, of olive and of orange groves, the land where the sunshine lingers lovingly upon her snow-crowned mountain tops. Through them, this land is ours! Therefore, noble remnant of that gallant band of pioneers, are we come to honor your gray hairs.

And next we recognize in this exposition a fitting landmark in the progress of the mining art. The hydraulic giant has displaced the rocker and the miner's pan, the stamp mill, now grown to lionhood, roars in the ravine, the diamond drill probes where the plummet cannot sound, dynamite rends the mountain, and electricity illumes the miner's footsteps and lightens his labors. In this age knowledge has become power, and at this day, without the aid of science the miner toils in vain. Hence to the California miner and his friends I come, in the name of Science, to pledge the unfailing aid and sympathy of California's University.

The plan of your University was cast by her large-minded founders in a worthy mold. Noble in its proportions, generous in its sympathies, it includes within its limits every deserving phase of human activity. Grounded on the utilities it yet reaches out and embraces the utmost yearnings of the human soul.

Recognizing in agriculture, in mining and the mechanic arts the foundation of all material progress, it aims to provide trained men who shall become leaders in these industries. Remembering the ills that flesh is heir to, the physician and the surgeon are sent to heal the sick or smooth the pillow of the dying. Believing commerce to be the great civilizer, it aims to make this fair city the key to the commerce of the Orient. History points her finger at the rocks on which have foundered empires. Law and civil policy develop and strengthen citizenship. Nor is science for its own sake forgotten. The fly embalmed in amber, the mote that swims the eyeball, the fish that swims the sea, the star that swims the heavens, is each alike the object of its loving scrutiny. And least of all is the higher nature neglected. Art, letters and philosophy all unite to pour into mind and heart the garnered wealth of all the ages—the only wealth that enriches, that beautifies and ennobles life, the faith that cheers and comforts the soul of man, even though his pathway lead him down through the valley of the shadow of death.

This, then, is the plan of the University of California, and I have not read aright the character of our people if they do not cherish this plan in their hearts, and day by day, and year by year, and generation after generation, do not give of their substance so that it may be nobly realized, and the light that was lit on the Berkeley hills may not go out, but burn clear until it shall illumine not only California, but all the world.

Is it not a wonderful mint, where you can send your sons and daughters to be remelted in its refining furnaces, where the base metal and the dross of their natures are burned away, and where, upon the refined gold of their very souls, is stamped with the seal of the University those undying words, "Let there be light"? "Let there be light, and there was light!" Let there be light, and there shall be light in California so long as her University shines out upon the sea—light on the rock-ribbed ocean, light in the cavernous mine, light in the hall of legislation, light in the court of justice, light in the pulpit, light on the path of duty, light and faith and hope and courage in the hearts of our people.

And now in conclusion, in the name of every man and woman who ever entered the halls of your University, I pledge a loyal devotion to the interests of the State in peace or war. Rest assured that your children, in whose hearts burn the words "Let there be light" may be depended upon, each in his own sphere and calling in life, to do his duty by the State, and, if need be, to die in her defense.

On the 22nd Gov. Budd, Mayor Phelan, J. H. Neff and others made speeches. Hon. Jno. F. Davis of Amador county was the orator of the evening and spoke at 8:30 P. M. He said:

Fellow-citizens of San Francisco:—The fiftieth anniversary of any event is its golden jubilee. On the 24th of last month we celebrated by a grand pageant in the streets of this city the golden jubilee of the discovery of gold on the Pacific slope. This magnificent mining fair is, I take it, but a continued celebration of that event; and today, set apart by your committee as "Miners' Day," is reserved for an exclusive mining celebration of the wonderful discovery of gold that ultimately gave to the world a new commonwealth, and to the flag of the Union its thirty first star.

To-day, which, under ordinary circumstances, we would devote exclusively to a celebration of the birthday of the "Father of his Country," to-day, while our eyes are still moist wi h sorrow for the fate of the brave men of the pride of our navy, and while we are yet patiently waiting to know what it means, to-day we celebrate an event that finally gave to our country its most valued and largest territorial acquisition Then, as now, on our Eastern seaboard, the timid for a while seemed to predominate. To them there was nothing west of the Rocky mountains but the Great American desert. But the energetic and the daring, the men who make history, the empire builders of that day, did not shrink at the mere thought of territorial aggrandizement. Every new landed acquisition that America had ever made—despite all the warnings of all the prophets—had proved a national blessing. So we, their descendants, as we celebrate our anniversary to-day, stop for a moment at the beginning of our work, and as we look abroad, to the east and to the west, we live the same feelings that cheered the national colors as they supplanted the Spanish at Monterey, as they supplanted the Bear flag at Sonoma. We feel that America must still yield to the manifest destiny that makes her great. No hostile threat of any foreign power, and no grasping insolence of any domestic trust, shall dispel our hope that the Stars and Stripes will yet float triumphant from Newport News to Pearl Harbor, from Washington to Havana, and from Honolulu to the Golden Gate.

The history of gold has been co-extensive with the history of the human race. In every account of a people we find mention made of gold, not of gold in nature or in place, but of gold in circulation and in the arts, and yet comparatively nothing as to the methods of its extraction One thousand eight hundred and forty-eight years after Christ the great science of practical gold mining and milling, as we know it to-day, was in its infancy. Though in other countries and in the mining of other metals contrivances of great power and ingenuity were already long in use, yet when Marshall first discovered the particles of shining gold in the tailrace of the lumber mill at Coloma on that memorable January day in 1848 human genius had not evolved the California quartz mill, nor human ear heard the thunderous music of its roaring stamps. The very conception of many of the most efficient parts of the one absolutely essential requisite of every producing quartz mine, the California stamp mill—the mill that has gone 'round the world—was still sleeping in the brains of men who are alive to-day. From the long-tom, the rocker, the Mexican arrastra, and the old mill with its wooden mortars, square wooden stems and straight wooden cams, to the modern stamp mill, with its iron mortars and stems, revolving tappets, circular cams, steel shoes, steel mouthed rock breakers, automatic ore feeders and oscillating vanners, all under the control of one's little finger touching an electric button, is to a transition from the crude methods of stone ages to the fulfillment of a wizard's dream Here, as ever, necessity was again the mother of invention, and just as long as there shall be low-grade rock to crush, or rebellious ore to reduce, just so long will human ingenuity invent and perfect new and wonderful processes for the extraction and saving of gold.

But with all this development of the processes of both mining and milling, what development has actually been made in the extent of mining itself? The first few years after the rush of '49 saw the working out of the richest and most accessible placers and crevice deposits throughout the State, and millions upon millions of gold was the result. The deep channels of the ancient rivers and the vast deposits which would only yield to the hydraulic process were next attacked, and were yielding an annual output of over ten millions of dollars alone, when hydraulic mining was suppressed by the heavy hand of the law. Mines of inestimable value and machinery worth millions of dollars were by a stroke of the pen rendered valueless. The finding of fact had been made in courts of law that the debris from the hydraulic mines was filling up the beds of the American, Feather, Sacramento and San Joaquin rivers, and the farmers of the valley complained that their lands were being ruined. Acting upon the legal principle that one must so use his own as not to injure his neighbor, the courts suppressed hydraulic mining throughout the State wherever the resultant debris flowed into these rivers, which practically meant suppressing it everywhere except in the Klamath river basin. In vain did the miner contend that the Government, having sold him his land and taken his money for it, was bound to make good an "implied guarantee" that the land could be used by the purchaser for the purpose for which it had been sold. The courts decided against him. Congress recognized no such claim, and maintained that any relief upon that ground would be class legislation. The miner found himself continually running against the steel wall that he had bought his land with his eyes wide open, and with a full knowledge that the inseparable condition of all ownership of property and of all liberty is the higher law that it must be so used as not to injure your neighbor.

For years all hope of the revival of hydraulic mining in any form was lost, until the miner coming to recognize the farmer's rights, sought his co-operation, and the new movement for the rehabilitation of hydraulic mining, under the leadership of one whom we honor to-day, the Hon. Jacob H. Neff, crystallized into the California Miners' Association. What has been accomplished since the birth of that association is well known to you all. Legislative genius discovered a principle through which Congress could be reached—a plan which in theory, no matter how comprehensive its method, is but an extension of the principle at the bottom of every River and Harbor bill. Not only has the principle for which we have struggled been established, but the Legislature of California and the Congress of the United States have each made an appropriation of $250,000 toward carrying it out, and Nevada City and Marysville, with equal self-interest, are to-day anxiously demanding to know why the work contemplated by the appropriations has not yet been begun.

With the suppression of hydraulic mining the output of California has been, south of the Klamath, confined to her drift mines and her quartz mines. Though during later years these mines have been the exclusive source of our gold production, and though in the last fifty years the gold production of this State has reached the enormous sum of $1,300,000,000, quartz mining in California is but begun It seems to me the California quartz miner has been the prodigal of the earth. Our men, our methods and our machinery have helped to open the quartz mines of all the world except those at home The Comstock, Colorado, Victoria, New South Wales, South Africa, Alaska, Venezuela—all have felt the influence of our capital and our genius, until of late years California has again begun to occupy our attention. The one great blow to legitimate gold mining in California, the one murderous thrust from which it is only now recovering, was the shameless exploiting of the Comstock lode of the State of Nevada upon the San Francisco market. So violent was the craze, so colossal the swindle, and so dependent on mere manipulation did the prices of shares become, that when the inevitable collapse came, all mining went under the ban, and was looked upon as stock gambling. No mining property in this State, however meritorious, could command the necessary money for its development. The result has been that the gold mining industry in this State has, until the last three or four years, lagged, and now that its revival is assured, we find that the great mineral veins of the Mother Lode have scarcely been touched. While the Keys one, the Idaho, the old Eureka, the Utica, the Plymouth Consolidated and the Kennedy have yielded between $5,000,000 and $12,000,000 each, still there has been no deep mining in California to speak of While the shaft at the Union Consolidated mine, in the State of Nevada, was sunk to a depth of 3350 feet fifteen years ago, I have the authority of Ross Browne for saying that there are but between twenty and thirty mines below 1000 feet, and but two below 2000 feet in California to-day. With the magnificent returns attained wherever legitimate quartz mining has been attempted in this State, and with the great mining belt of the Sierras waiting to be opened and developed, with the course of its great lodes specifically ascertained and its geology definitely known, with the uncertainty usually incident to mining in great measure eliminated, with wood at $4 a cord, with water at from 10 to 20 cents a miner's inch, with electric power passing by our front doors, with every appliance of the latest machinery at the call of our telephone, and with a climate which permits us to work in the open air all the year round, we are not tempted by the frozen horrors of all the Klondikes of all the world.

But on an occasion like this we turn from the living present to a kindly remembrance of the days gone by. Many of you have them over again as you look at the sights of this Mining Fair, the days of '49 and the Pioneers. The journey of the ox-team across a continent, the famine and thirst and horror of the desert, the apprehensive fear of the Indian, the struggle through the defiles of the Sierras, the life and luck of the mining camp, the longing for the loved ones you left behind, the night when you lay awake wondering what you would do with the result of your strike, the next day when you found yourself dead-broke, the almost womanly attachment you formed for your partner, the friendships that remained steadfast when all else was gone, the struggle to save the State to the cause of freedom—these are a few of your memories of the days when human nature was put on trial, and when in the end all the gold of its latent nobility came forth, sublimated from all the dross. The memory of the Pioneers will never pass; the traditions of Sutter's Fort, and Coloma, and Table Mountain and Poker Flat will live forever. The very odor of the balsam of the pines, the scent of wild azaleas, the gleam of banks of red sandstone, live in the pages of our history, while the eloquence of Starr King and Baker will survive as long as upon the broad domain of California the heart of a patriot will beat with love.

You of San Francisco owe a debt of gratitude to the Pioneers, which was recognized by the grand celebration of a month ago, and is even still more fittingly recognized by this mineral display. Your splendid municipality is part of the building of their hands. Here upon her seven hills San Francisco sits enthroned, the guardian of the commerce of the Orient. In no other metropolis of the world can fountains play and flowers bloom in the streets all the year round. No other metropolis is flanked on one side by a harbor in which all the navies of all the nations could ride at anchor, and on the other by a park that reaches down to where the waves of the ocean lave its feet. Here shall we find revived the old feeling for the municipality which the Athenian felt for his Acropolis, which the Roman felt for his Forum, which the Parisian still feels for his boulevard. The same contempt for obstacles which characterized the pioneer will fire your true San Franciscan, till grand avenues will cross and surround your city, till oaks and elms and lindens and acacias will line your drives and thoroughfares, till birds will sing in their branches, and fountains play in their shade—till the spirit of public improvement will so imbue every citizen that he will come to feel a proprietary interest in every petal of every flower in your park, in every pebble on your beach and every white-cap on your bay. We of the mountains and the mines wish you and yours every good fortune, and in return for what you have done for us, in return for all that you are at present doing for our every legitimate effort, we desire by the development of the mineral resources of California to do all in our power to build up and improve and beautify your grand metropolis, until its fame shall be such that every traveler on this earth shall come to visit it before he dies.

My friends, gold is the theme of the day we celebrate. But he ill interprets the thought and the ideals of our people who imagines that in this State, or on this day, or in our heart of hearts, we do not know that the claim of California to the gratitude of the nation can never rest alone on the fact of the material discovery of fifty years ago, or the material production of the years that have followed. This is indeed the Golden State, but—beyond all our golden one billion three hundred million dollars of the royal metal; beyond our golden grain, our golden oranges, our golden poppies, our golden sunshine and our golden wine—the history of our pioneer fathers and mothers, their struggles and triumphs in frontier life and mining camp, contains a promise that here, in the veins of this mighty commonwealth, in the life and soul of this great people, are other treasures, the outcroppings of which we discern to-day: the gold of an upright, downright, lightning-defying, intellectual honesty; the gold of a sincere and reverential spirituality; the gold of a frank, brave, strong and tender manhood; the gold of an intelligent, loving, loyal, pure and plucky womanhood. These are the treasures which California will lay at the feet of the nation; these are the virtues which are the lineal descendants of the courage and the heroism and high endeavor of the gulches and the mines, of those immortal scenes and incidents of the days of '49 that are to be the burden and the theme of the "unsung Iliad" of the Sierras and the pines.

The 22nd, Washington's Birthday, was Miners' Day at the Fair. Cornish wrestling and rock drilling were among the contests. Four-ton blocks of Folsom granite were to be drilled. The aggregate of cash prizes was about $1000; in addition, Mayor Phelan gave a handsome gold medal and the Palace Hotel gave a gold medal. The MINING AND SCIENTIFIC PRESS also gave a championship gold medal.

The rules for the contests, which were published in last week's issue, were strictly observed. The contest of three-handed teams, fifteen minutes continuous work, each team allowed sixteen drills, was won by Page, Kitto and Dingle of the Gerrymander mine, Tuolumne Co., 41⅛ inches; the brothers Feeney and Larkin of the Omaha mine, Nevada Co., second, 36¾ inches. The following day P. and J. Feeney of the Omaha mine, Nevada Co., won the two-handed contest, 26⅞ inches, Kitto and Page of the Gerrymander mine, Tuolumne Co., second, 26 9-16 inches. On the 24th inst., in the single-hand contest, J. J. Coan of Nevada City won first prize, 18 inches; T. L. Coffey, Nevada City, second, 17 3-16 inches. Subsequently, in a record-breaking, triple-handed drilling, Page, Kitto and Dingle drilled a hole through 43 11-16 inches hard-grain California granite in fifteen minutes, breaking the former world's record of 42 inches. The banner for the best general mineral exhibit was awarded to Tuolumne Co. The Fair will continue through next week, closing March 5th.

Some inquiry has been made as to previous contests of this nature. The first similar rock-drilling contest on the Pacific coast was held at the Midwinter Fair in San Francisco May 21st, 1894. At the Denver contest the previous year the world's best record was made by D. L. Jones, who single-handed sank a hole 18 11-16 inches deep in fifteen minutes. Page and Riggin of Butte, Montana, drilled a hole 29 15-16 inches in that time. Hearn and Rinker of Denver beat that time in '93, but not officially, they having drilled a hole 31¾ inches in fifteen minutes. At the Midwinter Fair contest E. F. Durham of Grass Valley took the first prize and the world's championship, drilling a hole 19 31-32 inches single-handed in fifteen minutes through Rocklin granite. T. J. Ahearn of Grass Valley, Cal., drilled 19 9-16 inches and took second prize. Both he and Durham broke all former records. In the double-team contest on that day Kitto and Harvey of Amador county, Cal., put a hole down 30 21-32 inches, winning first prize. Feeney and Lynch of Grass Valley drilled 27 5-32 inches, taking second prize. In the three-handed contest Dingle, Kitto and Harvey of Amador county put a hole clear through the 40 inches of Rocklin granite and had about 2 inches in on a second hole when their fifteen minutes was up, they winning first prize. The Feeney brothers and Lynch of Grass Valley, Cal., drilled almost through the 40 inches of granite in the quarter of an hour, taking second prize. In the contests of '94 and of this week the single-handed drillers used ⅝-steel and 4-pound hammers; double and triple teams, ⅞-steel and 8-pound hammers.

THERE is good prospect of the much delayed mineral land bill getting through Congress this session. According to recent Washington advices, Speaker Reed has experienced a change of heart, and has given assurances to California Congressmen that he is in favor of the bill. He had feared that if the bill should pass the House and get to the Senate it would come back with a number of amendments, and prove so cumbersome that it would have to be kept in conference a long time. When assured that there was a perfect understanding on this question he was more ready to listen to arguments. With one exception, the Senators who tried before to kill it by riders and amendments have been relegated to private life.

It appears from this report, made by the Commissioner of the General Land Office to the House Committee on the Public Lands, that that under the so-called "Idaho-Montana" act providing for the examination of lands lying within the railroad grants of those States, that during the years 1895–6–7 6,878,670 acres were classified in Montana by the commission created under that act, of which 3,206,270 acres were found to be mineral lands, and in Idoho 877,733 acres were examined by it and 275,640 acres were classed as mineral lands, leaving an estimated area for classification in Montana of 9,933,814 acres and in Idaho of 1,599,067 acres.

This report states that the total of the lands within the granted and indemnity limits in California which would be affected by the so-called Mineral Land bill (H. R. 3655) now pending in Congress, on favorable report of the House Committee on Public Lands, aggregates 13,679,602.29 acres.

If the ratio shown in Montana and Idaho by the classification of railroad lands therein is preserved in this State the enactment of the California Mineral Land bill would result in saving at least 6,000,000 acres of land to the miner and the prospector, which is about the amount already improperly patented to the various land-grant-aided railroad companies in this State.

United States Mining Laws, and Regulations Thereunder, Relative to the Reservation, Exploration, Location, Possession, Purchase and Patenting of the Mineral Lands in the Public Domain.

NUMBER II.

18. Upon the failure of any one of several co-owners of a vein, lode, or ledge, which has not been entered, to contribute his proportion of the expenditures necessary to hold the claim or claims so held in ownership in common, the co-owners, who have performed the labor or made the improvements as required by said Revised Statutes, may, at the expiration of the year, give such delinquent co owner personal notice in writing, or notice by publication in the newspaper published nearest the claim for at least once a week for ninety days; and if upon the expiration of ninety days after such notice in writing, or upon the expiration of one hundred and eighty days after the first newspaper publication of notice, the delinquent co-owner shall have failed to contribute his proportion to meet such expenditures or improvements, his interest in the claim by law passes to his co-owners who have made the expenditures or improvements as aforesaid. Where a claimant alleges ownership of a forfeited interest under the foregoing provision, the sworn statement of the publisher as to the facts of publication, giving dates and a printed copy of the notice published, should be furnished, and the claimant must swear that the delinquent co-owner failed to contribute his proper proportion within the period fixed by the statute.

TUNNELS.

SEC. 2323, R. S. Where a tunnel is run for the development of a vein or lode, or for the discovery of mines, the owners of such tunnel shall have the right of possession of all veins or lodes within three thousand feet from the face of such tunnel on the line thereof, not previously known to exist discovered in such tunnel, to the same extent as if discovered from the surface; and locations on the line of such tunnel of veins or lodes not appearing on the surface, made by other parties after the commencement of the tunnel, and while the same is being prosecuted with reasonable diligence, shall be invalid; but failure to prosecute the work on the tunnel for six months shall be considered as an abandonment of the right to all undiscovered veins on the line of such tunnel.

19. The effect of this is simply to give the proprietors of a mining tunnel run in good faith the possessory right to fifteen hundred feet of any blind lodes cut, discovered, or intersected by such tunnel, which were not previously known to exist, within three thousand feet from the face or point of commencement of such tunnel, and to prohibit other parties, after the commencement of the tunnel, from prospecting for and making locations of lodes on the *line thereof* and within said distance of three thousand feet, unless such lodes appear upon the surface or were previously known to exist.

20. The term "face," as used in said section, is construed and held to mean the first working face formed in the tunnel, and to signify the point at which the tunnel actually enters cover; it being from this point that the three thousand feet are to be counted upon which prospecting is prohibited as aforesaid.

21. To avail themselves of the benefits of this provision of law, the proprietors of a mining tunnel will be required, at the time they enter cover as aforesaid, to give proper notice of their tunnel location by erecting a substantial post, board, or monument at the face or point of commencement thereof, upon which should be posted a good and sufficient notice, giving the names of the parties or company claiming the tunnel right; the actual or proposed course or direction of the tunnel; the height and width thereof, and the course and distance from such face or point of commencement to some permanent well-known objects in the vicinity by which to fix and determine the *locus* in manner heretofore set forth applicable to locations of veins or lodes, and at the time of posting such notice they shall, in order that miners or prospectors may be enabled to determine whether or not they are within the lines of the tunnel, establish the boundary lines thereof, by stakes or monuments placed along such lines at proper intervals, to the terminus of the three thousand feet from the face or point of commencement of the tunnel, and the lines so marked will define and govern as to the specific boundaries within which prospecting for lodes not previously known to exist is prohibited while work on the tunnel is being prosecuted with reasonable diligence.

22. At the time of posting notice and marking out the lines of the tunnel as aforesaid, a full and correct copy of such notice of location defining the tunnel claim must be filed for record with the mining recorder of the district, to which notice must be attached the sworn statement or declaration of the owners, claimants, or projectors of such tunnel, setting forth the facts in the case; stating the amount expended by themselves and their predecessors in interest in prosecuting work thereon; the extent of the work performed, and that it is *bona fide* their intention to prosecute work on the tunnel so located and described with reasonable diligence for the development of a vein or lode, or for the discovery of mines, or both, as the case may be. This notice of location must be duly recorded, and, with the said sworn statement attached, kept on the recorder's files for future reference.

23. By a compliance with the foregoing much needless difficulty will be avoided, and the way for the adjustment of legal rights acquired in virtue of said section 2323 will be made much more easy and certain.

24. This office will take particular care that no improper advantage is taken of this provision of law by parties making or professing to make tunnel locations, ostensibly for the purposes named in the statute, but really for the purpose of monopolizing the lands lying in front of their tunnels to the detriment of the mining interests and to the exclusion of *bona fide* prospectors or miners, but will hold such tunnel claimants to a strict compliance with the terms of the statutes; and a *reasonable diligence* on their part in prosecuting the work is one of the essential conditions of their implied contract. Negligence or want of due diligence will be construed as working a forfeiture of their right to all undiscovered veins on the line of such tunnel.

SEC. 2329, R. S. Claims usually called "placers," including all forms of deposit, excepting veins of quartz, or other rock in place, shall be subject to entry and patent, under like circumstances and conditions, and upon similar proceedings, as are provided for vein or lode claims; but where the lands have been previously surveyed by the United States, the entry in its exterior limits shall conform to the legal subdivisions of the public lands.

SEC. 2330. Legal subdivisions of forty acres may be subdivided into ten-acre tracts; and two or more persons, or associations of persons, having contiguous claims of any size, although such claims may be less than ten acres each, may make joint entry thereof; but no location of a placer claim, made after the ninth day of July, eighteen hundred and seventy, shall exceed one hundred and sixty acres for any one person or association of persons, which location shall conform to the United States surveys; and nothing in this section contained shall defeat or impair any *bona fide* pre-emption or homestead claim upon agricultural lands, or authorize the sale of the improvements of any *bona fide* settler to any purchaser.

SEC. 2331. Where placer claims are upon surveyed lands, and conform to legal subdivisions, no further survey or plat shall be required, and all placer-mining claims located after the tenth day of May, eighteen hundred and seventy-two, shall conform as near as practicable with the United States system of public-land surveys, and the rectangular subdivisions of such surveys, and no such location shall include more than twenty acres for each individual claimant; but where placer claims cannot be conformed to legal subdivisions, survey and plat shall be made as on unsurveyed lands; and where by the segregation of mineral lands in any legal subdivision a quantity of agricultural land less than forty acres remains, such fractional portion of agricultural land may be entered by any party qualified by law, for homestead or pre-emption purposes.

25. But one discovery of mineral is required to support a placer location, whether it be of twenty acres by an individual, or of one hundred and sixty acres or less by an association of persons.

BUILDING STONE.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That any person authorized to enter lands under the mining laws of the United States may enter lands that are chiefly valuable for building stone under the provisions of the law in relation to placer-mineral claims; *Provided*, That lands reserved for the benefit of the public schools or donated to any State shall not be subject to entry under this act.

26. This act extends the mineral-land laws so as to bring lands chiefly valuable for building stone within the provisions of said law by authorizing a placer entry of such lands. It does not operate, however, to withdraw lands chiefly valuable for building stone from entry under any existing law applicable thereto. Registers and receivers should, therefore, make a reference to said act on the entry papers in the case of all placer entries made for lands containing stone chiefly valuable for building purposes. It will be noted that lands reserved for the benefit of public schools or donated to any State are not subject to entry under said act.

PETROLEUM AND OTHER MINERAL OILS.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That any person authorized to enter lands under the mining laws of the United States may enter and obtain patent to lands containing petroleum or other mineral oils, and chiefly valuable therefor, under the provisions of the laws relating to placer mineral claims; *Provided*, That lands containing such petroleum or other mineral oils which have heretofore been filed upon, claimed, or improved as mineral, but not yet patented, may be held and patented under the provisions of this act the same as if such filing, claim, or improvement were subsequent to the date of the passage hereof.

27. It is to be observed that the provisions of the mineral laws relating to placers are by said act extended so as to allow the location and entry thereunder of public lands chefly valuable for petroleum or other mineral oils, and entries of that nature made prior to the passage of said act are to be considered as though made thereunder.

28. By section 2330 authority is given for the subdivision of forty-acre legal subdivisions into *ten-acre* lots, which is intended for the greater convenience of miners in segregating their claims both from one another and from intervening agricultural lands.

29 It is held, therefore, that under a proper construction of the law these ten-acre lots in mining districts should be considered and dealt with, to all intents and purposes, as legal subdivisions, and that an applicant having a legal claim which conforms to one or more of the ten-acre lots, either adjoining or cornering, may make entry thereof, after the usual proceedings, without further survey or plat.

30. In cases of this kind, however, the notice given of the application must be very specific and accurate in description, and as the forty-acre tracts may be subdivided into ten-acre lots, either in the form of squares of ten by ten chains, or, if parallelograms, five by twenty chains, so long as the lines are parallel and at right angles with the lines of the public surveys, it will be necessary that the notice and application state specifically what ten-acre lots are sought to be patented in addition to the other *data* required in the notice.

31. Where the ten-acre subdivision is in the form of a square it may be described, for instance, as the "SE.¼ of the SW.¼ of the NW.¼," or, if in the form of a parallelogram as aforesaid, it may be described as the "W.½ of the W.½ of the SW.¼ of the NW.¼ (or the N.½ of the S.½ of the NE ¼ of the SE.¼) of section ——, township ——, range ——," as the case may be; but, in addition to this description of the land, the notice must give all the other *data* that is required in a mineral application, by which parties may be put on inquiry as to the premises sought to be patented. The proofs submitted with applications for claims of this kind must show clearly the character and the extent of the improvements upon the premises.

The proof of improvements must show their value to be not less than *five hundred dollars*, and that they were made by the applicant for patent or his grantors. The annual expenditure to the amount of $100, required by section 2324, Revised Statutes, must be made upon placer claims as well as lode claims.

32. Applicants for patent to a placer claim, who are also in possession of a known vein or lode included therein, must state in their application that the placer includes such vein or lode. The published and posted notices must also include such statement. If veins or lodes lying within a placer location are owned by other parties, the fact should be distinctly stated in the application for patent, and in all the notices. But in all cases, whether the lode is claimed or excluded, it must be surveyed and marked upon the plat; the field notes and plat giving the area of the lode claim or claims and the area of the placer separately. It should be remembered that an application which omits to include an application for a known vein or lode therein must be construed as a conclusive declaration that the applicant has no right of possession to the vein or lode. Where there is no known lode or vein, the fact must appear by the affidavit of two or more witnesses.

33. By section 2330 it is declared that no location of a placer claim, made after July 9, 1870, shall exceed one hundred and sixty acres for any one person or association of persons, which location shall conform to the United States surveys.

34. Section 2331 provides that all placer-mining claims located after May 10, 1872, shall conform as nearly as practicable with the United States systems of public surveys and the subdivisions of such surveys, and no such locations shall include more than twenty acres for each individual claimant.

35. The foregoing provisions of law are construed to mean that after the 9th day of July, 1870, no location of a placer claim can be made to exceed one hundred and sixty acres, whatever may be the number of locators associated together, or whatever the local regulations of the district may allow; and that from and after May 10, 1872, no location can exceed twenty acres for each individual participating therein; that is, a location by two persons cannot exceed forty acres, and one by three persons cannot exceed sixty acres.

36. The regulations hereinbefore given as to the manner of marking locations on the ground, and placing the same on record, must be observed in the case of placer locations so far as the same are applicable, the law requiring, however, that where placer claims are upon *surveyed* public lands the locations must hereafter be made to conform to legal subdivisions thereof as near as practicable.

PROCEDURE TO OBTAIN PATENT TO MINERAL LANDS.

SEC. 2325, R. S. A patent for any land claimed and located for valuable deposits may be obtained in the following manner: Any person, association, or corporation authorized to locate a claim under this chapter, having claimed and located a piece of land for such purposes, who has, or have, complied with the terms of this chapter, may file in the proper land office an application for a patent, under oath, showing such compliance, together with a plat and field notes of the claim or claims in common, made by or under the direction of the United States surveyor-general, showing accurately the boundaries of the claim or claims, which shall be distinctly marked by monuments on the ground, and shall post a copy of such plat, together with a notice of such application for a patent, in a conspicuous place on the land embraced in such plat previous to the filing of the application for a patent, and shall file an affidavit of at least two persons that such notice has been duly posted, and shall file a copy of the notice in such land office, and shall thereupon be entitled to a patent for the land, in the manner following: The register of the land office, upon the filing of such application, plat, field notes, notices, and affidavits, shall publish a notice that such application has been made, for the period of sixty days, in a newspaper to be by him designated as published nearest to such claim; and he shall also post such notice in his office for the same period. The claimant at the time of filing this application, or at any time thereafter, within the sixty days of publication, shall file with the register a certificate of the United States surveyor-general that five hundred dollars' worth of labor has been expended or improvements made upon the claim by himself or grantors; that the plat is correct, with such further description by such reference to natural objects or permanent monuments as shall identify the claim, and furnish an accurate description, to be incorporated in the patent. At the expiration of the sixty days of publication the claimant shall file his affidavit, showing that the plat and notice have been posted in a conspicuous place on the claim during such period of publication. If no adverse claim shall have been filed with the register and the receiver of the proper land office at the expiration of the sixty days of publication, it shall be assumed that the applicant is entitled to a patent, upon the payment to the proper officer of five dollars per acre, and that no adverse claim exists; and thereafter no objection from third parties to the issuance of a patent shall be heard, except it be shown that the applicant has failed to comply with the terms of this chapter.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That section twenty-three hundred and twenty-five of the Revised Statutes of the United States be amended by adding thereto the following words: "*Provided*, That where the claimant for a patent is not a resident of or within the land district wherein the vein, lode, ledge, or deposit sought to be patented is located, the application for patent and the affidavits required to be made in this section by the claimant for such patent may be made by his, her, or its authorized agent, where said agent is conversant with the facts sought to be established by said affidavits: *And provided*, That this section shall apply to all applications now pending for patents to mineral lands."

SEC. 2328. Applications for patents for mining claims under former laws now pending may be prosecuted to a final decision in the General Land Office; but in such cases where adverse rights are not affected thereby, patents may issue in pursuance of the provisions of this chapter; and all patents for mining claims upon veins or lodes heretofore issued shall convey all the rights and privileges conferred by this chapter where no adverse rights existed on the tenth day of May, eighteen hundred and seventy-two.

37. As a condition for the making of application for patent according to section 2325, there must be a preliminary showing of work or expenditure upon each location, either by showing the full amount sufficient to the maintenance of possession under section 2324 for the pending year, or, if there has been failure, it should be shown that work has been resumed so as to prevent relocation by adverse parties after abandonment.

The "pending year" means the calendar year in which application is made, and has no reference to a showing of work at the date of the final entry.

38. This preliminary showing may, where the matter is unquestioned, consist of the affidavit of two or more witnesses familiar with the facts.

LODE CLAIM.

39. The claimant is required, in the first place, to have a correct survey of his claim made under authority of the surveyor-general of the State or Territory in which the claim lies, such survey to show with accuracy the exterior surface boundaries of the claim, which boundaries are required to be distinctly marked by monuments on the ground. Four plats and one copy of the original field notes in each case will be prepared by the surveyor-general; one plat and the original field notes to be retained in the office of the surveyor-general, one copy of the plat to be given the claimant for posting upon the claim, one plat and a copy of the field notes to be given to the claimant for filing with the proper register, to be finally transmitted by that officer, with other papers in the case, to this office, and one plat to be sent by the surveyor-general to the register of the proper land district, to be retained on his files for future reference. As there is no resident surveyor-general for the State of Arkansas, applications for the survey of mineral claims in said State should be made to the Commissioner of this office, who, under the law, is *ex officio* the U. S. surveyor-general.

40. The survey and plat of mineral claims required to be filed in the proper land office with application for patent must be made subsequent to the recording of the location of the mine; and when the original location is made by survey of a United States deputy surveyor, such location survey cannot be substituted for that required by the statute, as above indicated.

DIRECTIONS FOR PREPARING PLAT.

41. The surveyors-general should designate all surveyed mineral claims by a progressive series of numbers, beginning with survey No. 37, irrespective as to whether they are situated on surveyed or unsurveyed lands, the claim to be so designated at date of issuing the order therefor, in addition to the local designation of the claim; it being required in all cases that the plat and field notes of the survey of a claim must, in addition to the reference to permanent objects in the neighborhood, describe the *locus* of the claim, with reference to the lines of public surveys, by a line connecting a corner of the claim with the nearest public corner of the United States surveys, unless such claim be on unsurveyed lands at a distance of more than two miles from such public corner, in which latter case it should be connected with a United States mineral monument. Such connecting line must not be more than *two miles* in length and should be measured on the ground direct between the points, or calculated from actually surveyed traverse lines if the nature of the country should not permit direct measurement. If a regularly established survey corner is within two miles of a claim situated on unsurveyed lands, the connection should be made with such corner in preference to a connection with a United States mineral monument. The connecting line must be surveyed by the deputy mineral surveyor at the time of his making the particular survey and be made a part thereof.

42. Upon the approval of the survey of a mining claim made upon surveyed lands the surveyor-general will prepare and transmit to the local land office and to this office a diagram tracing showing the portions of legal 40-acre subdivisions made fractional by reason of the mineral survey, designating each of such portions by the proper lot number, beginning with No. 1 in each section, and giving the area of each lot.

43. The following particulars should be observed in the survey of every mining claim:

(1) The exterior boundaries of the claim should be represented on the plat of survey and in the field notes.

(2) The intersection of the lines of the survey with the lines of conflicting prior surveys should be noted in the field notes and represented upon the plat.

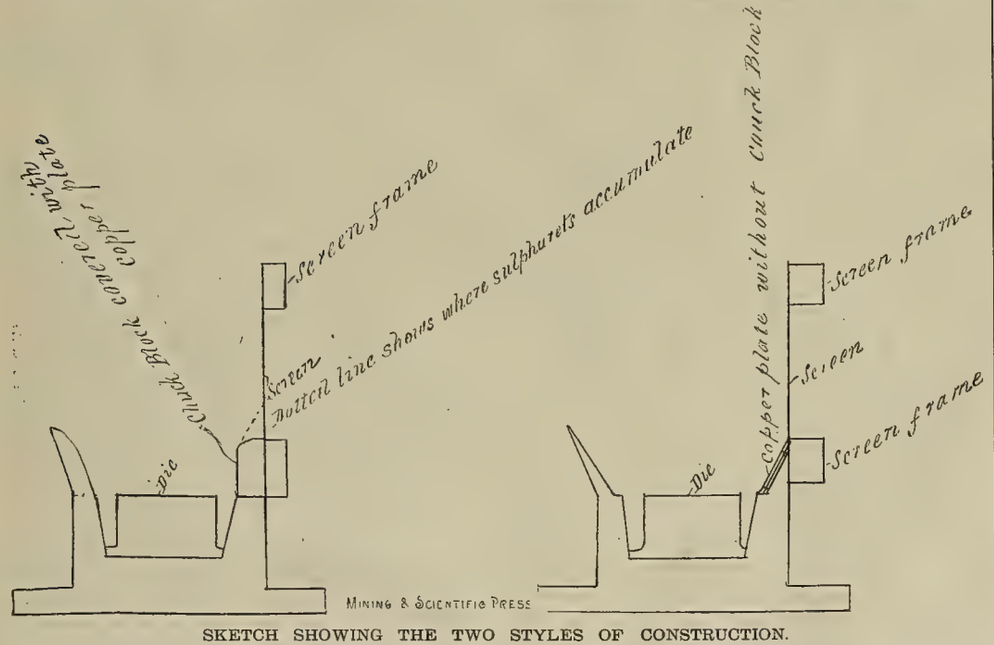
(3) Conflicts with unsurveyed claims, where the applicant for survey does not claim the area in conflict, should be shown by actual survey.

(4) The total area of the claim embraced by the exterior boundaries should be stated, and also the area in conflict with each intersecting survey, substantially as follows:

	Acres.
Total area of claim	10.50
Area in conflict with survey No. 302	1.56
Area in conflict with survey No. 948	2.33
Area in conflict with Mountain Maid lode mining claim, unsurveyed	1.48

It does not follow that because mining surveys are required to exhibit all conflicts with prior surveys the areas of conflict are to be excluded. The field notes and plat are made a part of the application for patent, and care should be taken that the description does not inadvertently exclude portions intended to be retained. It is better that the application for patent should state the portions to be excluded in express terms.

(To be Continued.)



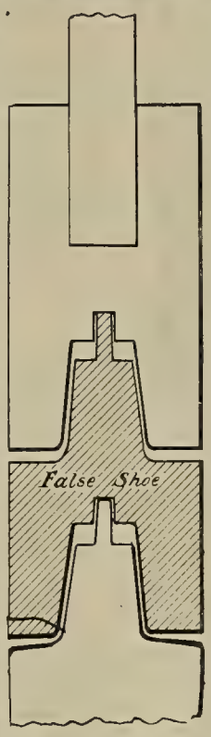
Proposed Changes in Stamp Mill Practice.

Frequent suggestions are received by this paper as to changes and proposed improvements in stamps, some of which seem of sufficient importance to justify notice. Under date of February 8th, Mr. W. Sharwood writes from Soulsbyville, Tuolumne Co., Cal., saying:

"In the article by E. H. Johnson on stamp milling, on page 160 of your last issue, I read with much interest his remarks on the chuck block, as used in almost all mortars made in this State."

Mr. Sharwood, in criticising the construction of one style of stamp mill, thinks that where the block in the mortar so nearly approaches the vertical it "prevents the pulp from being driven in a direct line from the top of the die to the lower edge of screen. With this obstruction nothing passes out of the lower 2 or 3 inches of screen but by flotation, the rounded top of the chuck block forming a complete barrier to the lower edge of screen, and at the same time making a ledge on which the sulphurets accumulate and pile against the screen until they are high enough to be moved by the wash, which is in a direct line from the top of die over the rounded edge of chuck block to wherever that line may strike the screen. I saw this mistake in construction more than twenty years ago, and when having some mortars made for the Keltz mine, I had a pattern made at the Sonora foundry which dispenses with the chuck block, the copper plate being riveted to a stout sheet-iron backing and set at an angle of 60° from the horizontal, being held in position by wooden wedges driven against lugs, which are cast for the purpose, at each end of the mortar, these wedges being easily pried out when the plates are taken out at cleaning-up time. The plates spring from a ledge cast in the mortars at a level with the top of the dies, and, being made with a feather edge, impinge against the screen frames exactly at the bottom of screens, the pulp thus having a freer discharge and a far less quantity of slimes being made. When the dies are about one-half worn down I take them out and put them in a battery which has a false bottom about 2½ inches thick; this keeps them up to level without the necessity of altering a chuck block. These mortars are in use in several mills in this county and have always given satisfaction, as the plates amalgamate better without scouring and a larger quantity can be crushed because of the freer discharge. I enclose a sketch on a 2-inch scale of the two styles."

The sketch has been engraved and appears herewith.



SKETCH SHOWING THE TWO STYLES OF CONSTRUCTION.

Recently was noticed herein a matter of interest in this connection which was suggested by Capt. Richard A. Parker, consulting engineer of the California Exploration Co. In this case the proposed improvement consisted of a false shoe to be inserted in the boss as the crushing shoe wears down, and which is designed to keep the stamp to its normal weight. It is made like the ordinary shoe, with a recess in its bottom the same as the recess in the boss. This, it is claimed, if inserted as the shoe wears down, will maintain the uniformity of the weight of the stamp and consequently maintain the uniformity of crushing, besides allowing an additional amount of wear from the worn shoe. This, however, introduces another feature and requires that the mortar boxes be high enough to permit the insertion of the false shoes, provision to be made for this.

While in South Africa in charge of some large properties, Capt. Parker made practical tests of these false shoes in mills erected there, with satisfactory results.

The illustration of the device is reproduced. On this matter, Capt. Parker, at the time said:

"Stamp milling on the Rand must be regarded in a different light from that of other places or other countries; there it is essentially a crushing machine and its usefulness is dependent upon its ability to pulverize the ore fine enough to liberate the gold and prepare the ore for chemical treatment. Elsewhere the primary object is to amalgamate the ore in the mortar; but the two objects are in a measure opposed to each other. The usual weight of the stamp is 950 to 1050 pounds, and as high as five and a quarter tons per day of blue ore is crushed by the latter weight stamp. To increase the weight of the stamp necessitates an increased area of wearing parts. A 9-inch die used with a 1050-pound stamp has $63\frac{5}{10}$ square inches of wearing surface. If the weight of the stamp is increased this wearing area should be increased, and the proportionate area for a 1250-pound stamp is 84 square inches, which corresponds to $10\frac{3}{8}$ inches in diameter for the die.

"One thing that is notable in South Africa is the fact that the shoes are made much deeper there than here, in order that a smaller proportion of metal may be thrown away when the shoe is worn out. The advantage of using a false shoe, therefore, becomes much more important in cases where deep shoes are used. All over California there has been an increase of late in the depth of shoes. Mill men are beginning to realize the fact that stamps should be heavier than those used ten years ago.

"So far as my knowledge goes, the ultimate end of all our milling work is going to be confined very largely to the question of crushing. It certainly was so in South Africa, and I see no critical difference between what would constitute good practice there and here. Stamps weighing on an average 800 pounds in South Africa have been replaced by those weighing 1000 pounds, and in many cases up to 1250 pounds.

"Of course, the question of crushing is a function of the mortar and stamp and shoe and die; and in the mortar of late years the tendency has been to reduce its size so as to keep the pulp upon the dies. In Colorado there are extreme cases where it has been found necessary to amalgamate as far as possible in the mortars, and there are in use 600-pound stamps which drop 16 inches thirty times a minute. The crushing capacity of such a plant is necessarily limited; and as you pass through the various stages of heavier stamps with an increasing number of drops per minute you finally reach the present modern practice of 1250-pound stamps dropping 8½ inches from ninety-two to ninety-five times per minute. With ample plate surface—which is of the utmost importance—the question of amalgamation in the mortars does not become so essential in the majority of ores found in California mines. The greater the crushing capacity, of course, the less the cost."

There are stamps now made in this city and in use in this State that weigh 1400 pounds each.

The Witwatersrand Banket, With Notes on Other Gold-Bearing Pudding Stones.*

NUMBER VI.

By GEO. F. BECKER.

The free gold in the matrix, like the pyrite, seems to be in two different conditions. Dr. Koch found the metal in minute crystals, or in irregular, sharp-cornered, hackly aggregates. Mr. Pelikan observed it in irregular lumps, grains and scales, which, in his opinion, correspond beyond a question to alluvial occurrences. According to Mr. De Launay, the gold almost always occurs as extremely minute scales, often so thin as to be translucent, very rare exceptions being aggregates of gold on the white quartz veins, small masses of free gold crystallized by secondary solution in the banket and coatings on joint planes. Mr. Crosse also has found evidence of the existence of gold in a crystalline condition. In my slides the gold in the matrix corresponds most closely to Mr. De Launay's description. It appears in irregular flakes and scales, which often conform to the accompanying sand grains, as if pressure had molded the metal. The grains are not smooth, but neither have they either the crystalline appearance or the hackly surface of gold in vein quartz. The scales are often excessively thin, and pass over into mere yellowish-brown stains in which, by the help of direct sunlight, shining yellow points can be observed. The smaller scales of gold found on beaches are not ordinarily smooth, but they are smoother than those of the banket. I believe that pressure and the roughness of the surrounding detritus have determined their outlines to a large extent in the pudding stone.

Besides the more important minerals of the banket, Dr. Koch found in the matrix magnetite (also noted by Mr. Curtis), zircon, rutile, tourmaline, muscovite, chlorite and a colorless highly refracting mineral not determined. Mr. Pelikan found biotite and a greenish mineral, perhaps identical with Dr. Koch's, which he suspects of being pyroxenic. Dr. Hatch notes marcasite, copper pyrite, blende, galena, ilmenite and magnetite. He also records that Mr. Crosse has detected corundum by chemical means. I have repeatedly found pyrrhotite in the mines (for example, in the Crown Deep), but only in association with the white quartz veins referred to above. There is either magnetite or hematite among the pebbles of my slides, and zircons were observed. The main mass of the matrix consists, besides gold and pyrite, of sand grains, chlorite and sericite and secondary quartz. It is interesting and important to compare this matrix with slides of the quartzite adjoining the banket, because many grains which might be interpreted as secondary in the matrix are there seen to be mere sand. In both quartzite and matrix it is apparent that the sand grains have been largely attacked by sericite and that a portion of the irregularity of outline is due to this cause. The matrix also contains prisms, often grouped in fan-shaped aggregates, of a colorless secondary mineral, possibly an amphibole. The same or a similar mineral was noted by Koch and by Pelikan. Its determination is not essential for the purposes of this paper.

Distribution of Gold in Banket.—It is well recognized on the Rand that, other things being equal, the coarser pebble carries the greatest quantity of gold. Usually the rich ore is heavily sulphureted, but this is not invariable. As a rule, the thinner portions of reefs are richer than the thicker portions. It is usually the under portion of a coarse streak which is the richest, but such a coarse streak is sometimes met with in the lower portion of a reef and sometimes in the upper portion. There is in this respect no general rule. It is said that the sandstone near the banket in rare instances carries gold. It is known, however, that in some alleged instances of this kind the gold was really confined to the parting between the sandstone and the banket. The banket is patchy. There are rich patches and poor ones, rich patches in poor ones, and poor patches in rich ones. Sometimes these patches have an elongated form, and then are often called "chutes." Opinions differ among managers as to whether there are on the Rand any real continuous chutes or channels, such as are almost invariably found in gold-bearing quartz veins. I could learn of no case which was an indubitable chute as distinguished from an elongated patch. As a rule, the bodies are certainly patches, and, if there are true chutes as well, two distinct types of deposit are present. The general uniformity of appearance and conditions militate against this view.

It has already been mentioned that the Lower Cape is intersected by numerous dikes, mostly of

* Eighteenth Annual Report Mineral Resources of the United States.

diabase or closely allied rocks, these dikes being connected in the most evident and intimate manner with the formation of the white quartz seams which carry pyrrhotite and rarely pockets of gold. I made a special effort to ascertain whether the dikes are in any way connected with the tenor of the banket, and consulted many of the most experienced managers on the subject. There is, I believe, no connection whatever. The ore at and near a dike is sometimes rich and sometimes poor; a single dike will intersect one stope, or one reef, at a point where the assays are high, and will cut another working or another stratum of pudding stone in a poor patch. The conditions are such as they would be if, after ore deposition were complete, the country has been disrupted and injected with dikes having no connection with the deposition of gold in the banket. Mr. Launay come to precisely the same conclusion, and emphasizes it by an "assay plan" with the dikes drawn into it, and this diagram fully justifies his position. On the other hand, Mr. P. R. Krause insists that the dikes and the distribution of gold are intimately related. He is unable to cite any valid evidence in favor of his view, confessing that the only direct "demonstration" of the connection between mineralization and the eruptive rocks is the occurrence of chlorite and talc in the matrix of the conglomerates. I presume that for talc one should read sericite. As a matter of fact, micas, including sericite, are distributed through the Lower Cape, as they are in most sandstones; and chlorite, the most ordinary decomposition product of mica, is very common in ancient sandstones or quartzites. Talc is not more significant in this respect than chlorite.

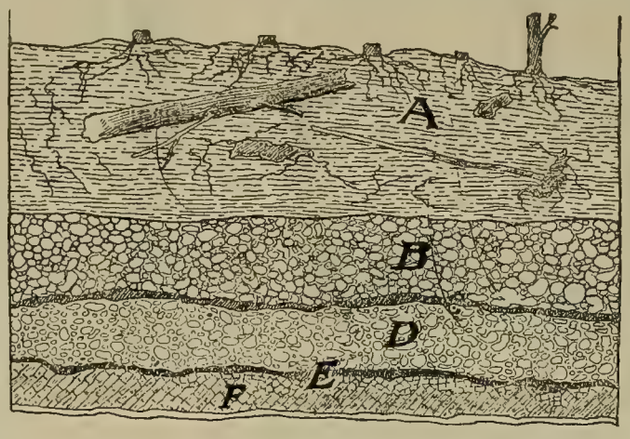
Theories of Deposition.—In the foregoing pages an attempt has been made to gather all the more striking facts which it is necessary to consider in testing the theories propounded to account for the deposition of gold on the Rand. One of them must be right.

The theory that the banket reefs are of alluvial origin, representing metamorphosed placers, was probably the earliest to be suggested, and was held as long ago as 1887, when gold production first began. Who first advocated this solution I am unable to state. It has been supported in 1891 by Mr. De Launay, who has since adopted another view, and by Mr. Pelikan in 1894.

In 1888 Mr. W. H. Penning was led, mainly by the character of the gold (which he describes as occurring in sharp gains, not waterworm), to state: "I am convinced that it was deposited—at the same time the gravels were being accumulated—from water holding gold in solution." This is the opinion expressed by Mr. De Launay in his latest work, 1896.

In discussing Mr. Penning's paper, Mr. W. Topley suggested that the water which, percolating through the already formed conglomerates, deposited the gold may have been at a high temperature. In 1890 my friend, Mr. J. S. Curtis, published a paper on the banket, in which he states that Mr. Gardner F. Williams, now manager of the Kimberly diamond mines, considered the gold in the conglomerate as not alluvial but quartz gold, deposited after the upheaval of the strata. Mr. Curtis accepted this view, considered the deposits as closely resembling lodes, and referred the impregnation of the conglomerates to the action of the dikes. This opinion is based on the angular character of the gold and on the presence of pyrite both in the banket and in the dikes. Had the iron sulphide of the banket been alluvial, Mr. Curtis says, "there would have been pebbles of pyrites." Of course the large proportion of rounded pebbles of pyrite in the banket was then unknown. Mr. Curtis explained the fact that gold is not found in the sandstone by the relative porosity and openness of the conglomerate. The view of the deposits first distinctly expressed by Mr. Curtis is that to which Dr. Koch leans, and which is adopted by Messrs. Hatch and Chalmers, and by almost all the engineers on the Witwatersrand.

Impregnation Theory.—None of the theories are free from objections, real or specious. The impregnation theory implies that there must be deep fissures through which the auriferous solutions obtained access to the once barren banket beds, and that the solutions permeated the coarse beds to the practical exclusion of the finer sandstone strata. A system of fissures such as would be needed to convey metalliferous solutions certainly exists in the dikes and faults so abundant on the Rand. There are also less pronounced partings or joints, often nearly parallel to the conglomerate beds. These last are very important in stoping the ore, and they are well known to all managers. All of these dislocations were produced during the upheaval of the beds from a nearly horizontal position into that which they now occupy. The gold in the banket is not distributed in any apparent relation to the dislocations. Not only do the dikes cut the reefs in poor and rich patches indiscriminately, as was pointed out above, but such of the dislocations as are in sandstone or in quartzite are, as a rule, absolutely barren. The fissures are also almost altogether wanting in some localities where the ore is nevertheless of good grade. This is the case in portions of the Geldenhuis Deep and of the Simmer and Jack. In these mines there is often an inconvenient absence of any partings to which stoping can be carried, and this "freezing" is not attended by any falling off in the assays. On the other hand, the white quartz veins are manifestly related to the dikes, often starting from them or accompanying them, and themselves not dislocated by the fissure system to any greater extent than is easily accounted for by slight renewals of movement postdating the main upheaval. The white veins, however, cut and fault the banket, but without enriching or impoverishing it. The only natural conclusion is that the dikes and white veins postdate not merely the formation of the conglomerate, but the conglomeration of gold in the banket. The deep fissures which afforded channels for the ore-bearing solutions might be narrow, as a rule; but it is hardly possible that all of them should be so, and it is most improbable that the ore which they contained should not be rich, as rich as the banket would be if all the pebbles were removed from it. Now, no such "rake veins," as they would be called, have been met with on the Rand.



(*To be Continued.*)

Geology of the Yukon.*

NUMBER V—CONCLUDED.

The Tahkandit series shows in a marked degree less decomposition and metamorphism than the Rampart series, and there is a probable unconformity existing between the two.

Above the Tahkandit series comes the Mission creek series, which is, in part at least, Cretaceous, and is made up of black calcareous and feldsparic shales, impure thin-bedded limestone, gray sandstone and conglomerate. Seams of impure coal and obscure plant remains are often found, but occasional fossils show the series to have been largely a marine formation. At the base is a conglomerate, which rests on the Rampart series and Forty Mile series, and contains pebbles derived from these rocks.

A—Muck, frozen, 10 ft. to 15 ft; B—Gravel, rarely pay; C—Clay Selvage; D—Pay Dirt, 1 ft. to 5 ft.; E—Selvage; F—Bedrock, Cloritic Schist.

SKETCH SHOWING LOCATION OF PAY STREAK IN KLONDIKE PLACERS.

Above the Mission creek comes a great thickness of massive conglomerates, with coarse grits and some sandy, argillaceous limestone and impure shales. These rocks contain abundant plant remains and occasional fresh water fauna, on the evidence supplied by which they are referred to the Eocene. There are no marine fossils or other evidence of marine conditions. The conglomerates contain pebbles of the Rampart series, Forty Mile series, Birch creek series, and various other sedimentary and igneous rocks. This great thickness of fresh water beds has been called the Kenai series.

The Tahkandit series, Mission creek series and the Kenai series all show about the same amount of dynamic disturbance, there being apparently no very great unconformity separating them one from another, and all having been folded together. Sometimes these folds are gentle, sometimes broad and open, and sometimes closely compressed and vertical. Owing to this folding, there is local jointing, but all the rocks have been practically unaffected by regional shearing.

The beds overlying the Kenai series are few and scattered. On the upper part of Mission creek are partially consolidated, nearly horizontal conglomerates and grits, carrying plant remains, which appear to correspond with beds on the Porcupine and Mackenzie rivers. All these sediments are probably local accumulations in lakes of limited extent. Those on the Mackenzie, which were examined by Mr. McConnell, have been referred by Sir William Dawson, on the evidence of the flora which they contain, to the Laramie; but there is still room for the suspicion that they may be assigned to the Miocene. These beds are separated by a profound unconformity from the underlying Kenai series, being only gently tilted, while those of the Kenai are sharply folded. At the lower ramparts are cross-bedded sandstones, with fossil leaves, cones and fragments of wood. These beds are probably Pliocene. Finally come the Pleistocene and recent silt sand gravels, which are scattered all over the country as a result of deposition in the great lakes and rivers.

From the evidence furnished by conglomerates everywhere throughout this region, we know that the gold-bearing rocks, such as those of the Forty-Mile and Birch-creek series, were exposed to atmospheric erosion since the beginning of the deposition of the Mission-creek series, and probably before; and this erosion must have gone on at intervals ever since. During all this period the process of concentration went on in rivers, on beaches and in other places, precisely as at the present day, so that portions rich in gold, or placers, must continually be forming. At times an extremely rapid erosion and deposition, moreover, such as that under which the Kenai conglomeratic series was deposited, coarse gravels suitable for the accumulation of gold, were rapidly laid down. It is reasonable to suppose, therefore, that these auriferous conglomerates, or fossil placers, will, in future, be found to have a wide distribution, and may become of considerable importance from a commercial standpoint.

All the gold produced in Alaska is alloyed with a certain small amount of silver. Besides this, pure native silver is frequently found, along with gold, in minerals concentrated in the placer workings, generally in small rounded or irregular nuggets, although occasionally, as at one place in Franklin gulch, well crystallized. Native lead occurs in small nuggets on Hog'em or Deadwood creek, and nuggets of gold which come from this gulch sometimes contain native lead in small bits. Native copper, in small rounded nuggets, has been found on Little Minook and Hunter creeks.

Platinum has frequntly been found in the Yukon district, chiefly in the diggings in the upper part of the Yukon drainage system. On Twelve-Mile bar, which is 12 miles below the Big Salmon river, on the Yukon, the yield in platinum is said to have been two or three ounces to each 10 or 12 ounces of gold; the metal, however, was not saved, since the miners were ignorant of its value.

The tiny flakes or colors of gold which are found so widely distributed in the sands and gravels of streams are capable of being carried enormous distances without being destroyed, and are many times deposited and again taken into suspension by changes of current. Thus it happens that fine, or flour gold, in small quantities, may be found along the entire course of most of the rivers in Alaska. On account of this indestructibility and facility of transportation, fine gold affords no adequate index of the source from which it is derived. As the gold becomes more abundant and coarse, however, it is clear that the source is being neared. Thus, at Forty-Mile creek and on Birch creek, the bars of the main streams were richer than the bars of the Yukon, into which they flow. In this way, prospectors find continually richer accumulations, until finally, in certain gulches whose waters run into the river on which the bars have been previously worked, gold is found which is fairly coarse and in considerable quantity. In these gulches nuggets are found, and fragments of quartz and gold mixed. It is evident that these placers are nearest the true source of the gold, and that from here have been derived the finer and rarer particles which occur in the bars of the larger streams, and also the still finer and rarer particles in the rivers in which these streams empty. Therefore, in inquiring as to the source of a placer, we may pass over the widespread fine, or flour, gold in the great rivers, and also the bar diggings in the tributary streams, and confine our study to the gulch diggings.

One feature of the repert is a chapter devoted to coal in the neighborhood of the gold belt. Mr. Spurr says that the thick beds of the Kenai series are crossed everywhere by more or less coaly layers. Coal is found at Mine creek and on the Lewis river. Coal creek runs into the Yukon about eight or ten miles north of Forty-Mile creek, and there are two four-foot seams of coal here. On American creek and Napoleon creek coal is found. The rocks are invariably steeply inclined, and are often highly folded and even contorted. This difference renders the veins difficult and expensive to follow, and taken in conjunction with the low grade makes it very probable that although the coal may, in some cases, be found convenient for domestic use, it will not pay for exportation.

*Condensed from advance sheets of "Geology of the Yukon Gold Dist. of Alaska," by Josiah Edward Spurr, of the U. S. Geo. Survey.

J. B. SEMPLE of Sewickley, Pa., has patented a projectile, the path of which may be marked by the gunner during its flight. A mixture of magnesium, gunpowder and some oxidizing agent, bound together by shellac or some other gum, is so secured to the projectile as not to be dislodged during its flight.

Some Complimentary Notices.

Immediately upon the issuance of the Golden Jubilee edition notices innumerable, unanimously favorable, were received, and multitudes of commendatory and congratulatory letters also came. In a period when many other special editions of numerous papers and periodicals made notice of even a few impossible, it is especially gratifying that so many of our contemporaries made kindly comment on the one that they considered most worthy. To publish a tithe of those gracious comments would transcend our limits, for it would require another special edition to contain them, but they are none the less gratefully and cordially appreciated. To illustrate, however, the scope and character of those friendly notices all that can appear on this one page are herewith republished:

Of Exceptional Interest to All.

The big Golden Jubilee edition of the MINING AND SCIENTIFIC PRESS, which was issued yesterday, is one of the handsomest special numbers ever issued by a technical journal and is of exceptional interest to the general reader as well as to the expert miner and the pioneer. Inside the artistic cover the pages are filled with illustrations, some interesting as expositions of mining processes and many being reproductions of old woodcuts illustrating the mining life of the Argonauts. Two pages are given to a valuable paper on "The Mother Lode of California," by Ross E. Browne, and the origin and evolution of the California stamp mill is described by C. P. Stanford. "Recollections of California Mining Life," bountifully illustrated, runs through seven pages, and among other features of special interest are, "The Beginning of Quartz Mining in California," by Almarin B. Paul, and "Gold Formations in California," by W. H. Storms. The reliability and high character which have given this old journal a world-wide reputation provide a large part of the value of this special number.—*San Francisco Call, Jan. 30.*

This Journal Is Popular With Advertisers.

The Golden Jubilee edition of the MINING AND SCIENTIFIC PRESS fully carries out the promises of the publishers. Its attractive features commence with the handsome cover design in three colors, and they continue until the end. The history of mining in this State is exhaustively treated, and a wealth of illustrations depict early scenes and methods. One is struck with the vast amount of business carried in the MINING AND SCIENTIFIC PRESS. The manager, Mr. J. F. Halloran, does not believe in one-time insertions, and the advertisements in the PRESS represent substantial contracts. This journal is popular with advertisers, and there must be a good, substantial basis for this popularity—it is quite possible that an ad in the MINING AND SCIENTIFIC PRESS sells goods.—*The Ad Book, San Francisco, Feb., '98.*

Nothing Better Ever Issued.

It is a pleasure to note the Golden Jubilee number of the MINING AND SCIENTIFIC PRESS of San Francisco. Nothing better, both in artistic features and contents—having regard to the purpose for which it was published—has ever issued from a printing press. The last page of the cover, although entirely devoted to an advertisement, is, with its delicate half-tone tints and gold border, simply a superb bit of work. The subject matter embraces a series of editorials and special articles written in celebration of California's Gold-Mining Jubilee. Among these latter is one on the "Origin of the California Stamp Mill," by Mr. C. P. Stanford. Another, describing the "Beginning of Quartz Mining in California," is by Mr. Almarin B. Paul. But to the general reader the one that will be found the most interesting—and most interesting it is—is the one entitled, "Recollections of California Mining Life." The article is illustrated with engravings reproduced from the MINING AND SCIENTIFIC PRESS of thirty years ago.—*Los Angeles, Cal., Review, Feb. 12.*

This Journal's Crowning Enterprise.

Like everything that comes from the MINING AND SCIENTIFIC PRESS, its Jubilee number is simply perfect. It is a statistical and descriptive souvenir to be read and preserved for reference. It summarizes the whole history of mining in the State. It traverses every grade of discovery and development in placer, hydraulic and fissure mining, from Sutter's mill to the latest methods of deep and underground workings, with such clear-cut and comprehensive precision as to be both interesting and instructive. It is the crowning enterprise of a journal that stands or falls with the mining industry.—*Mountain Democrat, Placerville, Cal., Feb. 5.*

A Marvel of Typographical Art.

One of the handsomest and most complete publications ever laid upon our desk is the Golden Jubilee edition of the MINING AND SCIENTIFIC PRESS of San Francisco. Its makeup is a marvel of typographical art and its pages are a history of mining in California since Marshall first discovered gold in the State.—*Kokomo, Colo., Whooper.*

Greatest Paper Ever Issued on the Coast.

The Golden Jubilee edition of the MINING AND SCIENTIFIC PRESS of San Francisco is the greatest paper ever issued on the Pacific coast. Every mining operator should have a copy.—*Silverton, Colo., Miner, Feb. 4.*

Full of Mining History.

In gold and purple the MINING AND SCIENTIFIC PRESS commemorates the fiftieth anniversary of the discovery of gold. The Jubilee number of this valuable journal is full of mining history of much value and interest. Not the least noticeable feature of this paper is a collection of early-day scenes, taken, if our memory serves us, from Hutchins' pioneer magazine, bringing up from the almost forgotten past not alone the crudity of mining methods in those days, but also the crudities of the engraver's art.—*Plumas, Cal., Independent, Feb. 5.*

[All the old engravings were from the early files of this paper.—ED.]

No More Attractive Specimen Could Be Offered.

A buffalo-Indian-tragedy novel is the young boy's idea of a western publication, but to the grown man who prefers the actual facts no more attractive specimen of western print could be offered than the Golden Jubilee edition of the MINING AND SCIENTIFIC PRESS of San Francisco. A copy of this splendid production, which has reached this office, is bound in cream and gold and is filled with illustrations of pioneer mining scenes in California and thrilling descriptions of the times when Marshall discovered gold at Sutter's mill. There are also many other striking illustrations quite in keeping with the high standard of the MINING AND SCIENTIFIC PRESS as a progressive and attractive chronicle of the great western mining industry.—*Pueblo, Colo., Chieftain, Feb 4.*

Suggestive of Vast Strides.

Special editions of newspapers have been as thick as leaves in Vallombrosa of late, and the exchange editor is hardly through noticing one triumph of the art preservative before another, richer and finer, is brought to his notice. Notable among these editions de lux is the Golden Jubilee number of the MINING AND SCIENTIFIC PRESS, which comes to us this week brave in green and purple and gold covers, and full to brimming with reminiscences and historical data of "the days of old, the days of gold, and the days of '49." Many of the illustrations are reproduced from cuts used on the paper thirty years ago, and are suggestive of the vast strides that have taken place in pictorial illustration since then. It is a splendid number.—*Downey, Cal., Champion, Feb. 5.*

Creditable to the Publishers.

The Golden Jubilee edition of the MINING AND SCIENTIFIC PRESS was a beautiful number, and one that certainly will be read with interest by the people of California. The illustrations were excellent, and altogether it is a publication that reflects great credit upon the publishers.—*Placer, Cal., Herald, Feb. 4.*

A Credit to the Art Preservative.

The Golden Jubilee number of the San Francisco MINING AND SCIENTIFIC PRESS of the 29th ult. is a grand exposition of the mining resources of our State, giving, as it does, a history of mining operations since the first discovery of gold. It is a credit to the art preservative, and its publishers may well be proud of their success in getting out so interesting and valuable a paper.—*Chronicle-Union, Bridgeport, Cal., Feb. 5.*

A Splendid Number.

The Jubilee edition of the MINING AND SCIENTIFIC PRESS is a splendid number. It contains a comprehensive history of the progress of the industry during the fifty golden years following Marshall's discovery of the nugget in the millrace at Coloma. The origin of gold found in the ancient river channels and the formation of quartz veins are treated at length. It contains a generous number of engravings showing mining scenes from early days to the present.—*Colfax, Cal., Sentinel, Feb. 4.*

A Magnificent Paper.

The Jubilee number of the MINING AND SCIENTIFIC PRESS of San Francisco was a magnificent paper, containing a graphic account of the discovery of gold in California and the subsequent lively incidents connected with the great rush of gold-seekers to the Pacific coast. The illustrations are numerous and beautiful, and the whole paper bespeaks the employment of the best brains and typographical skill.—*Wurd, Colo., Miner, Feb. 4.*

Articles All by Able Writers.

The finest Jubilee edition of any of the San Francisco papers that we have seen is that of the MINING AND SCIENTIFIC PRESS. Its articles are all by able writers and the paper is not crowded with boom advertising.—*Mirror, Sisson, Cal., Feb. 3.*

Interesting and Attractive.

The Golden Jubilee edition of the MINING AND SCIENTIFIC PRESS, which came to hand this week, is an exceedingly interesting and attractive number, exhibiting in the mechanical get-up the highest and best art of the typographer and engraver.—*Mining Journal, Grant's Pass, Or., Feb. 5.*

Was a Splendid Work.

The Midwinter mining edition of the San Francisco MINING AND SCIENTIFIC PRESS was a splendid work, and illustrates that the PRESS is in the lead as the representative of the great industry of the coast.—*Shasta, Cal., Courier, Feb. 5.*

A Task Admirably Performed.

The Golden Jubilee number of the MINING AND SCIENTIFIC PRESS of San Francisco is a superb edition of 52 pages, elegantly illustrated and containing much information of real value. It was certainly very proper that a journal devoted to California's great mining industry should commemorate the fiftieth anniversary of the discovery of gold in this State by issuing a special edition showing the progress that has been made in gold production during the half century that has passed since Marshall picked up those nuggets in the mill race. This task the MINING AND SCIENTIFIC PRESS has admirably performed. Its special edition is historically and practically of high value.—*San Diego, Cal., Union Jan. 31.*

A Grand Edition Worth Keeping.

The Jubilee number of the MINING AND SCIENTIFIC PRESS, which was issued Saturday, January 29, 1898, is a grand edition and well worth procuring and keeping for reference. It is devoted to the mining interests and gives an interesting history of the discovery of gold in California and a general history of the mining up to the present day in California, together with pictures of mining implements and machinery of '49 and those of the present day.—*Mariposa, Cal., Gazette, Feb. 5.*

Of Sterling Character and Unblemished Reputation.

On the 29th of January the MINING AND SCIENTIFIC PRESS of San Francisco issued a Golden Jubilee edition of fifty-two pages. The cover design is a striking and artistic piece of work in colors, being appropriate for the jubilee occasion. This journal and its management are to be complimented on the success achieved by this publication. It is a representative journal of its class, and its sterling character and unblemished reputation enables it to command the respect of the commercial world. The Jubilee number has a large advertising patronage.—*Modern Machinery, Chicago, Feb.*

Contains a Fund of Information.

The Golden Jubilee edition of the MINING AND SCIENTIFIC PRESS, containing 52 pages, is a beauty. It is richly illustrated and contains a fund of information concerning the finding of gold at Sutter's mill January 19, 1848, and the progress of the mining industry on the coast down to the present time.—*Mercur, Utah, Mercury, Feb. 4.*

The Foremost Mining Paper.

The MINING AND SCIENTIFIC PRESS of San Francisco, which is the foremost mining paper on the Pacific coast, issued a magnificent "Golden Jubilee Edition" January 29th, in honor of the celebration of the fiftieth anniversary of the gold discovery in California.—*Tintic Miner, Eureka, Utah, Feb. 4.*

Every Miner Ought to Get a Copy.

The Jubilee number of the MINING AND SCIENTIFIC PRESS is a very handsome souvenir, giving a fine historical sketch of early mining in California, with the various improvements since. Also contains handsome illustrations of the old and new style quartz mills, the hydraulic process, dredger machinery, elevator process, etc. A good description with diagram occupies one full page, relative to the R. H. Campbell hydraulic elevator, now doing good work at the Cariboo mines in British Columbia, at a depth of over 250 feet below the surface, in raising pay gravel. This Jubilee issue is one that every miner ought to get a copy of and note the great improvements in working quartz, river, placer and drift mines.—*Yreka, Cal., Journal, Feb. 1.*

An Authority on Mines.

The MINING AND SCIENTIFIC PRESS of San Francisco to-day issues a Jubilee number. The paper is an authority on Pacific coast mines.—*Del Norte, Cal., Record, Jan. 29.*

A Magnificent Number.

The San Francisco MINING AND SCIENTIFIC PRESS commemorated the Golden Jubilee of the discovery of gold in California by the issuance of a magnificent number of 52 pages, containing much matter of interest and importance to miners and others.—*Jacksonville, Or., Times, Feb. 1.*

An Issue To Be Proud Of.

The Golden Jubilee edition of the MINING AND SCIENTIFIC PRESS, issued at San Francisco on the 29th, is one of the handsomest publications that has reached us. The cover is artistically printed in colors, with a picture of Marshall, the discoverer of gold, and the locality where the discovery was made. The inside pages of the number are replete with interesting and valuable information to the miner and those interested in mining. It deals with the primitive method of mining in the days of '49 as to those now in vogue, and has much that will interest those who contemplate going north. Taken altogether the issue is one that the PRESS may well be proud of.—*Del Norte Record.*

Interesting and Instructive.

The Golden Jubilee edition of the MINING AND SCIENTIFIC PRESS appears in an illustrated cover and devotes much space to interesting and instructive articles upon the "Origin of the California Stamp," "A Model California Stamp Mill," "The Mother Lode," "Beginning of Quartz Mining," "Recollections of Early Mining Life," etc.—*Placer, Cal., Republican, Feb 3.*

Invaluable for Future Reference.

The Golden Jubilee edition of the MINING AND SCIENTIFIC PRESS surpassed expectation in the artistic manner in which it was gotten up. Its compilation of early-day mining in this State, illustrations and general makeup make it invaluable for future reference to every person interested in the State and its progress.—*Herald of Trade and Finance, San Francisco, Feb. 4.*

A Credit to the Office, the City and the State.

The illustrated Golden Jubilee edition of the MINING AND SCIENTIFIC PRESS, published at San Francisco, has been duly received at this office, and is one of the most artistic typographical productions that has reached our table during the holiday season. It contains a beautiful pen picture of the history of gold mining in California from the primitive days of '49 up to the present time, and in fact the publication is not only a credit to the publishers and San Francisco, but to the whole State of California.—*Merced, Cal., Star, Feb. 3.*

Congratulations and Best Wishes.

The Jubilee edition of the MINING AND SCIENTIFIC PRESS, commemorating the fiftieth anniversary of the discovery of gold in California, is a typographic beauty as well as an interesting compendium of historical data bearing on the important event. Its prosperous advertising pages bear eloquent testimony to the fact that the PRESS has not lagged in the onward march of progress enjoyed by the wonderful coast State, which up to this year has enjoyed a monopoly of the title, "The Golden State." The *Record* tenders congratulations and best wishes to the management of the MINING AND SCIENTIFIC PRESS upon its success.—*Daily Mining Record, Denver, Colo., Feb. 1.*

Much Interesting Reading Matter.

The Golden Jubilee edition of the MINING AND SCIENTIFIC PRESS, San Francisco, Cal., contains much interesting reading matter concerning California's gold fields in early days.—*Courier, Grant's Pass, Or., Feb. 1.*

Excellent From Start to Finish.

The Golden Jubilee edition of the MINING AND SCIENTIFIC PRESS comes to us with finely illuminated covers and about 50 pages of excellent matter. Ross E. Browne contributes a fine article on "The Mother Lode of California," with cuts and illustrations that show a thorough familiarity with the subject. C. P. Stanford and A. B. Paul follow with articles respectively on "The Origin of the California Stamp" and "The Beginning of Quartz Mining in California." W. H. Storms gives his ideas on "Gold Formation in California." "Recollections of California Mining Life" are given in accuracy of detail by another pioneer contributor. The number is excellent from start to finish.

Well Worthy of Preservation.

The big Golden Jubilee edition of the MINING AND SCIENTIFIC PRESS is one of the handsomest and most interesting numbers ever issued by a technical journal. The articles within the beautifully embellished covers are reminiscent, to a large extent, of the discovery of gold in California by Marshall, and in a separate article the journal offers strong proofs that the date of the discovery of gold was January 19, 1848, instead of the 24th of that month. The entertaining articles are profusely illustrated, those of bygone days and the methods of gold-extracting then, by old wood-cuts used by the MINING PRESS thirty odd years ago. This special number is a complete resume of mining and mining methods from the days of the Argonauts to the present time. It is a historical number well worthy of preservation.—*Georgetown, Cal., Gazette, Feb. 4.*

Filled With Choice Material.

The Jubilee edition of the MINING AND SCIENTIFIC PRESS is at hand, and a beauty it is, too. It is filled with choice material of interest to every miner in the land, giving as it does many cuts and the authentic history of the first gold discovery in California by Marshall.—*Lemhi Republic, Salmon, Idaho, Feb. 5.*

A Magnificent Number.

The Golden Jubilee edition of the MINING AND SCIENTIFIC PRESS of San Francisco is a magnificent number of 52 pages, profusely illustrated and filled with interesting historical matter and much valuable information concerning the California mining industry.—*San Jose, Cal., Mercury, Feb. 9.*

An Artistic Number.

The Golden Jubilee edition of the MINING AND SCIENTIFIC PRESS of San Francisco is one of the best and most artistic numbers of the year. It is largely historical and is profusely illustrated.—*Kelso, B. C., Kootenaian, Feb. 2.*

Shows Commendable Enterprise.

The Golden Jubilee edition of the MINING AND SCIENTIFIC PRESS of San Francisco has been placed on the *Democrat* exchange table. The publication is a valuable one, treating as it does historically of the mining resources of the State of California from the first discovery of gold in that State in 1848 up to the present time. The enterprise shown by the publishers of the PRESS by this issue is commendable and more than ever shows the merit of this mining journal.—*Baker City, Or., Democrat, Feb. 2*

Generally Useful and Valuable.

The Jubilee number of the MINING AND SCIENTIFIC PRESS, issued January 29, is perhaps the most generally useful and valuable compendium of early mining history that has been published in the State in honor of the gold discovery. Its contributors are mostly mining men of experience and close observation. The early history of mining has received careful attention and the articles are well illustrated.—*Republican, Placerville, Cal., Feb. 3.*

The Whole History of Mining Reviewed.

We are in receipt of a fine Golden Jubilee edition issued by the San Francisco MINING AND SCIENTIFIC PRESS. The whole history of mining in California is reviewed in a series of articles which embrace every branch of the subject from the discovery of gold in 1848 to the latest modern improvement in the elaborate stamp mill of the present day. The paper is profusely illustrated, and will be valuable to all who are interested in the discovery and development of the rich gold mines in that State.—*Bisbee, Ariz., Orb, Feb. 5.*

Coast Industrial Notes.

—The San Francisco free market project is moribund.

—Santa Monica, Cal., is to have a $500,000 beet-sugar factory.

—The Golden Jubilee Committee report: Collections, $21,753 33; expenditures, $20,450 10; balance, $1302.23.

—In 1897 the value of the dry wines made in this State amounted to $25,500,000; brandy, $1,000,000; sweet wines, $5,000,000.

—In '97 the St. Paul & Tacoma Lumber Co., of Tacoma, dressed over 35,000,000 feet of lumber; the Grays Harbor Commercial Co., 29,000,000 feet.

—Los Angeles contains the largest manufactory of bee hives and apiarian supplies west of the Missouri river. California produces more and better honey than any other State in the Union.

—The Tacoma, Wash., machine shops report a scarcity of first-class machinists. Good machinists are paid from $3 25 to $3 50 a day. Machinists, ship-builders and other skilled workers are in demand on Puget Sound.

—The Union Beet Sugar Co. of San Francisco has let a contract for a $500,000 beet sugar plant to be located on the Goldtree tract near Santa Maria, Cal. E. C. Burr of the Alameda Sugar Co. is to be manager.

—Trustees Los Angeles oil companies have under contemplation the construction of a tank steamer for transportation of crude petroleum to San Francisco, piping the oil to San Pedro, or other available coast point.

—The Alaska craze has created an enormous demand for coast vessels, steam and sail, and besides local craft, several are on the way from the Atlantic side. San Francisco and Seattle shipbuilders are busy supplying the demand.

—It is now proposed to build three feeders for the Sierra road to radiate from Jamestown, Cal., to be operated by electricity. The three proposed roads would connect Jamestown with Sonora, Jacksonville and the Stanislaus river.

—In reference to the Klondike business the Canadian Pacific Telegraph Co. has decided to lay an additional cable between Vancouver and Victoria. The company is also stringing another heavy copper wire between Montreal and Vancouver.

—The largest single payment of customs at Port Townsend, Wash., for February, was $46,000, paid as duties on 14,000 barrels of cement brought by the British ship Wray Castle, to be used on the gun emplacements of the Marrowstone point fortifications.

—Talk of an opposition steamship line between South and Central American ports and San Francisco is revived. The Compania Sud American de Vapores, and the Pacific Steam Navigation Co., are said to be considering the venture, the former company to leave weekly, touching at Coquimbo, Antofagasta, Iquique, Mollendo and Callao, arriving at Panama in ten days. Then the latter to take up the running, touching at the principle Central American and Mexican ports, making the run to San Francisco in twelve days; thus the passage from Valparaiso could be made in a little over three weeks.

—Creamery butter being high priced in California, the market is flooded with "process butter," sold at a profit for 25 cents a pound, at which price there would be a loss on creamery butter. To make this process butter, odds and ends of dairy butter, difficult of sale, are bought up, then melted, the oil sweetened by the addition of some chemicals and churned with milk. This manufactured butter presents a good appearance and tastes well, but it will not keep. As this product, however undesirable it may be, is really butter and not made from animal fats, it does not come under the law relating to oleomargarine.

—The gold of the Yukon is beginning to yield up of its treasures a small share to the public revenue. A remittance from Gold Commissioner Fawcett, at Dawson, has arrived at Ottawa, amounting to $130,000. Of this, $50,000 was left by two Scandinavians named Karlson, brothers, who died of typhoid fever last fall. The money is to be forwarded by the authorities to their father in Norway. The $80,000 is the proceeds of fees. To this may be added another $85,000, which will make a total revenue from the Yukon of $165,000 to date.

Personal.

J. O. JONES, Supt. South Fork mine, Forest, Cal., is in San Francisco.

A. DE LAND has taken charge of the Oregon Bonanza mine, Ashland, Or.

F. S. ROUMAGE, Supt. Maus mine, Forest Hill, Cal., is in San Francisco.

F. ZEITLER, Supt. Champion mine, Nevada City, Cal., is in San Francisco.

C. O. ALLEN has taken charge of the Old Glory mine near Phœnix, Ariz.

R. C. WALRATH, Mgr. Reward mine, Nevada City, Cal., is in San Francisco.

O. L. BARTON, Supt. Herman quartz mine, Westville, Cal., is in San Francisco.

W. R CHADBOURNE, Mgr. Mikado mine, Leadville, Colo., is in San Francisco.

H. E. PICKETT, Mgr. Grand Victory mine, Placerville, Cal., is in San Francisco.

S. C. WILMANS, Supt. Boulder mine, Shingle Springs, Cal., is in San Francisco.

H. KRUSE succeeds R. Sutton as Supt. of the Utah Mg. Co., Fish Springs, Utah.

C. H MALLON, Supt. Brunswick mine, Grass Valley, Cal., is in San Francisco.

WM. MCKINLAY, Supt. Providence mine, Nevada City, Cal., is in San Francisco.

W. T. GRAHAM, owner in the Jupiter Con. mine, Auburn, Cal., is in San Francisco.

SENATOR CHAPMAN, Gen. Mgr. Taylor mine, Garden Valley, Cal., is in San Francisco.

CY. MULKEY, Supt. Spreckels & Mulkey mine, Fairplay, Cal., is in San Francisco.

F. T. FREELAND becomes Gen. Mgr. of the Ibex M. Co., Leadville, Colo., March 1st.

E. L. HALL has succeeded W. D. Johnson as Supt. of the Gold Point at Sunshine, Utah.

E. N. LINDSAY is the new Supt. of the Grand Central M. Co., Las Amarillas, Mexico.

T. H. SELBY has returned to San Francisco from mine examination at Nacosari, Mexico.

F. S. ROUMAGE, Horseshoe Bar and Maus mines, Forest Hill, Cal., is in San Francisco.

GEO. MAINHART, Supt. Omaha and Bullion mines, Grass Valley, Cal., is in San Francisco.

S. GRANGER, Mgr. Pittsburgh mine, Grass Valley, Cal., returned home from San Francisco.

E. W. HOPKINS, Pres. Gold Hill M. Co., Grass Valley, Cal., has returned to San Francisco.

G. W. FLETCHER, owner in the Reddick gravel mine, Grass Valley, Cal., is in San Francisco.

G. C. STRODE, part owner of the Strode mine in Trinity Co., has returned home from San Francisco.

N. W. MOODY, Prest. Tuolumne County Mining and Development Co., has returned from Sonora to Fresno.

H. J. REILING has resigned the presidency and general managership of the Gold Dredging Co., Bannack, Montana.

H. BRATNOBER arrived in San Francisco this week from London. He says the Rothschilds will build a railway from Skaguay to the Klondike if suitable franchise can be secured from Canada. In this connection Hamilton Smith is in Ottawa.

JUDGE JOHN F. DAVIS of Jackson, Cal., has returned home from San Francisco. Judge Davis was the orator of the evening at the Mining Fair on Washington's Birthday.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING FEBRUARY 15, 1898.

593,137.—CARRYING APPARATUS—J. Anderson, Walla Walla, Wash.

593,281.—CAR FENDER—H. W. Bodeman, S. F.

593,217.—TREE PULLER—E. P. Boden, Santa Clara, Cal.

593,161.—SASH HOLDER—L. H. Bowman, Walla Walla, Wash.

593,178.—FISHING REEL—F. J. Boyle, Tacoma, Wash.

593,236.—BOTTLE STOPPER—J. A. Donahue, Los Angeles, Cal.

593,171.—ROLLING PIN—A. B. Fowler, Shelton, Wash.

593,143.—BICYCLE LOCK—J. J. Hall, Los Angeles, Cal.

593,988.—EXCAVATOR—F. H. Heath, Tacoma, Wash.

593,040.—THRUST BEARING—F. H. Heath, Tacoma, Wash.

593,037.—TROLLEY—C. H. Johnson, Elmhurst, Cal.

593,243.—TABLE—J. J. Klingler, Santa Cruz, Cal.

593,251.—SASH HINGE—H. M. Pitman, S. F.

593,259.—SPRING GEAR—S. Q. Saunders, New Bridge, Ogn.

28,281.—DESIGN—SPOON HANDLE—H. J. Klumpp, Portland, Ogn.

28,300.—DESIGN—HARP GUITAR FRAME—C. Knutsen, Port Townsend, Wash.

NOTE.—Plain and Certified Copies of U.S. and Foreign patents obtained by Dewey, Strong&Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

AUTOMATIC PRESSURE EQUALIZING BEER FAUCET.—F. W. Shields, L. A. Spinelli and C. R. Martin of San Jose, Cal. No. 598,579. Dated Feb. 8, 1898. This invention relates to an improved device for drawing beer. It consists of a means for automatically reducing and equalizing the pressure from the cask to the receptacle so that beer or other effervescent liquid can be drawn at all times under a regulated pressure, thus avoiding the great mass of foam or froth which is caused by the escape of gas from the liquid when drawn in the ordinary manner. The device is so constructed as to regulate the pressure by an automatic mechanism and to retain the gas pressure within the cask or receptacle until all the liquid has been drawn therefrom. It consists essentially of a casing having a draw-off at one end, a hollow stem at the opposite end adapted to fit directly into the cask or receptacle and an intermediate chamber into which the liquid is received, a pressure regulator between the inner end of the stem and the adjacent end of the receiving chamber, this regulator consisting of a central body with exterior passages, said body having a chamber at one end in communication with the receiving chamber, a valve stem movable in said body having at one end a valve to close the passage through the hollow stem and a piston fixed to its opposite end of larger area than that of the valve, so that whenever the pressure within the receiving chamber increases beyond the desired point, it will act upon the piston and close the valve at the opposite end to prevent any further escape from the cask to the receiver. Whenever the faucet is opened to draw any liquid, the pressure in the receiver is reduced, the pressure on the valve overcomes that on the piston, allowing it to open for the further passage of liquid into the receiver. The faucet is peculiarly constructed, having a tapering body fitting a corresponding shell in such a manner that the faucet is opened by moving the body into the larger diameter of its shell or chamber and allowing the liquid to flow around it and pass out in a thin sheet.

TREE OR VINE PULLERS.—Edmund P. Boden, Santa Clara, Cal. No. 599,217. Dated February 15, 1898. This invention relates to an apparatus which is especially designed to pull small trees, vines and bushes from the ground. It consists essentially of a four-wheeled vehicle, the front and rear wheels of which are situated at a considerable distance apart, an inclined truss framework extending between the two sets of wheels having a track or runway from one end to the other, a truck adapted to travel upon the track having a chain or means to connect it with the tree or vine to be pulled when the truck is at the lower end of the runway. When the wagon is drawn ahead, the truck runs up the inclined plane of the framework and thus acts to pull the tree.

Recent California Mining Incorporations.

Cleveland G. M. Co., Monterey; capital stock $100,000, all subscribed; W. Hannon, T. J. Field, E. Michaelis, R. C. Sargent, J. E. Sexton.

Tri Color Con. M. Co., San Francisco; capital stock $5,000,000, all subscribed; C. S. Long, C. W. Everett, C. C. Hamilton, W. G. Long, P. V. Long.

Van M. Co., San Francisco; capital stock, $100,000; subscribed, $50; W. L. Dickenson, W. K. Speed, A. R. Cotton, B. Baldwin, G. S. Buckley, W. B. English.

Pacific M. Co., Pomona, Cal.; capital stock, $250,000; subscribed, $60; F. E. Adams, A. D. Thatcher, M. C. Allen, S. F. Davis, C. A. Ludlow, E. Barnes, S. W. Arbuthnot, E. C. Cady, G. F. Kendall.

Normandy G. M. Co., San Francisco; capital stock, $120,000; subscribed, $160; S. Johnston, P. Caroe, J. L. Mine, L. W. Kauffman, C. W. Cross.

California-Alaska M. and T. Co., San Francisco; capital stock, $100,000; subscribed, $1800; M. Kane, D. A. Reed, A. W. Von Schmidt, C. E. Naylor, J. A. Miller.

The M. and I. D. Co., San Francisco; capital stock, $100,000; subscribed, $250; W. R. Boon, W. A. Bushnell, C. M. Weymann, C. J. Armbruster, H. L. Weber.

Recently Declared Mining Dividends.

Victor, Colo., $50,000; payable March 1.

Gold Coin, Colo., 1 cent per share, $10,000; payable Feb. 25; total to date, $40,000.

Napa C. Quicksilver M. Co., California, 10 cents quarterly dividend and 10 cents extra per share, $10,000; payable April 1.

New Idria Quicksilver M. Co., California, quarterly, 10 cents per share, and an extra of 5 cents per share, $15,000; payable March 1.

Ætna Con. Co., California, 10 cents per share, $10,000; payable March 10.

Mammoth, Utah, 5 cents per share, $20,000; payable March 1.

Moon-Anchor, Colorado, 2½ cents per share, $15,000; payable March 2.

Lillie G. M. Co, Colorado, 1 cent per share, $9000; payable March 1.

Raven G. M. Co., Colorado, 1 cent per share, $15,000; payable March 1.

Dutch M. & M. Co., Cal., 5 cents per share; Feb. 23.

Big Seven mine, Montana, $8000; payable March 1.

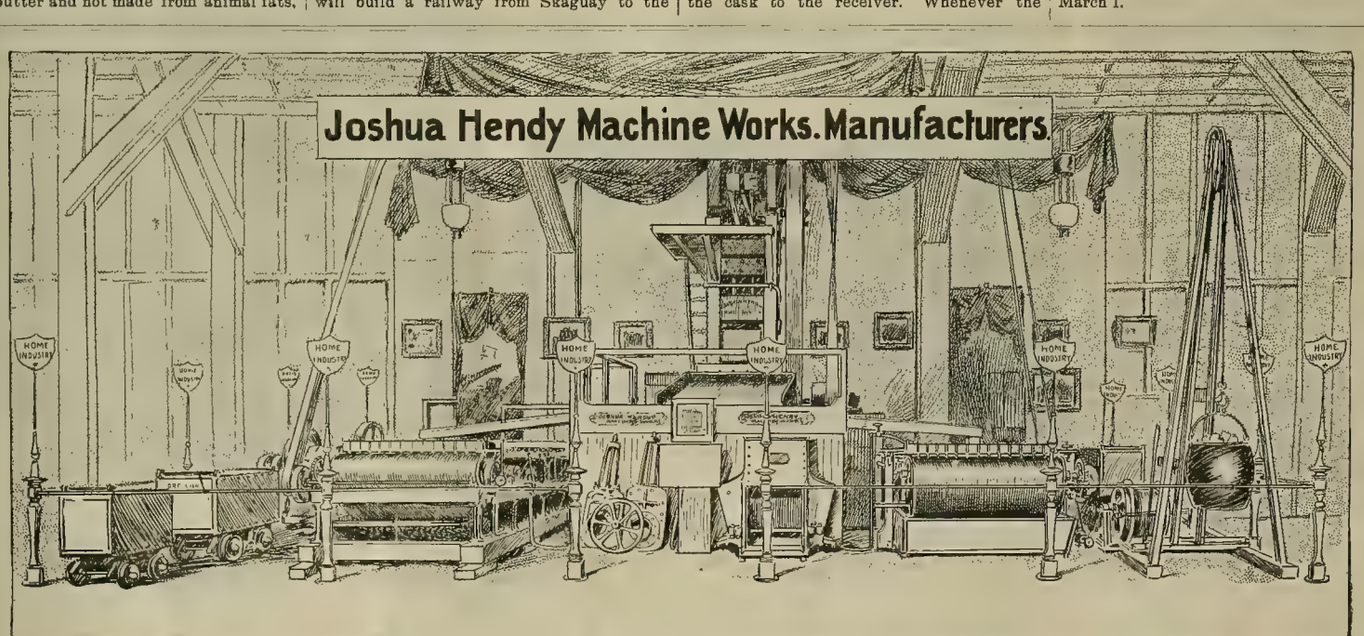


EXHIBIT OF THE JOSHUA HENDY MACHINE WORKS AT THE GOLDEN JUBILEE MINING EXPOSITION.

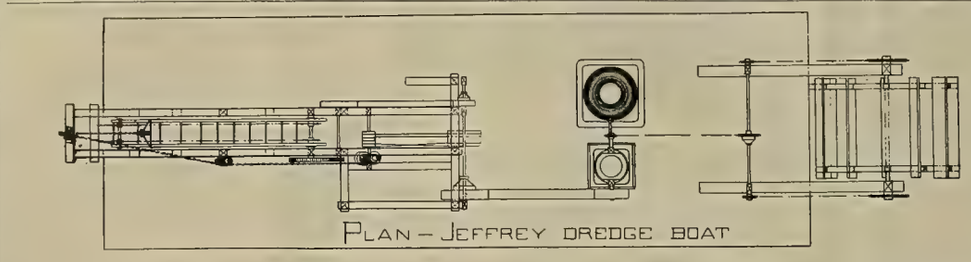
This exhibit, which has attracted considerable attention among mining men, comprises hydraulic and quartz mining and milling machinery, and consists of hydraulic gravel elevators, giants, water gates and pipe, "Hendy triple discharge" two-stamp mill, "Challenge" ore feeder, "Triumph" and Hendy-Norbom concentrators, horse-power, hoisting whim, ore crusher, ore buckets and cars, hoisting, horizontal and vertical engines.

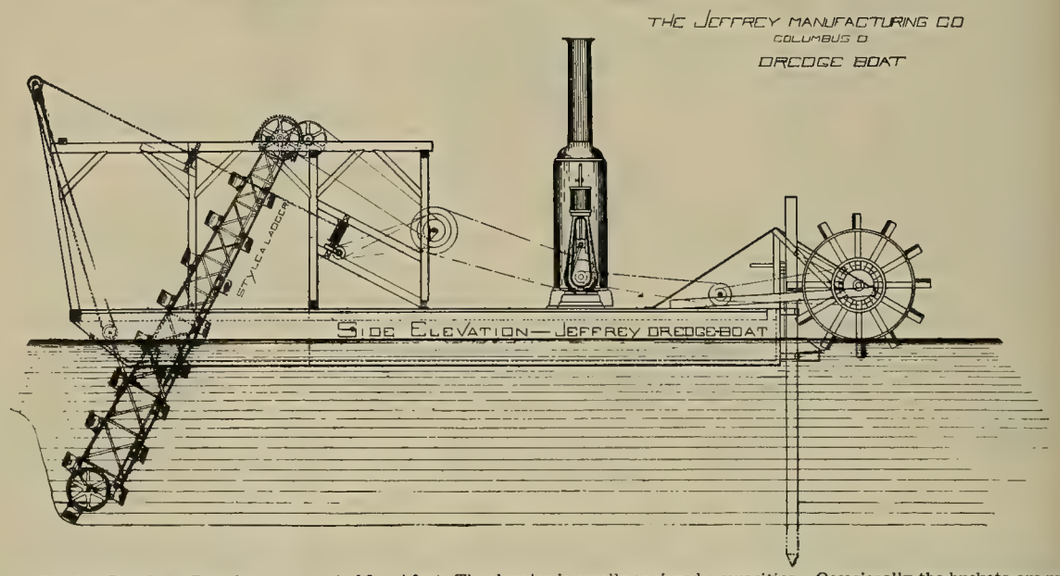
Single vs. Multiple Cylinder Engines.

Not every engineer is clear in his mind as to how an engine with three or four or even five cylinders can be more economical or have a greater efficiency than an engine doing the same number of expansions in a single cylinder. Briefly stated, it is because the extremes of temperature in each cylinder are kept more close together, that the multiple cylinder engine owes what merit it possesses.

Steam at 200 pounds pressure has a temperature of about 387°, and at atmospheric pressure we all know that its temperature is 212°. This gives a difference of temperatures of 175°, which the steam has to pass through during every stroke of the piston. If a condenser is used, and the temperature run down to 160°, the difference will be increased to 227°.



The above is a big variation in temperature for the walls of a cylinder to pass through twice during each stroke of an engine, and from the nature of the material of which the cylinder is made such a thing is impossible, therefore the steam is exposed to a cooling influence, and condenses, thus reducing its volume, and consequently its pressure, before the steam has a chance to act fully on the piston. This is the real reason why there is a loss—the cold iron cools the steam and reduces the pressure of the steam.

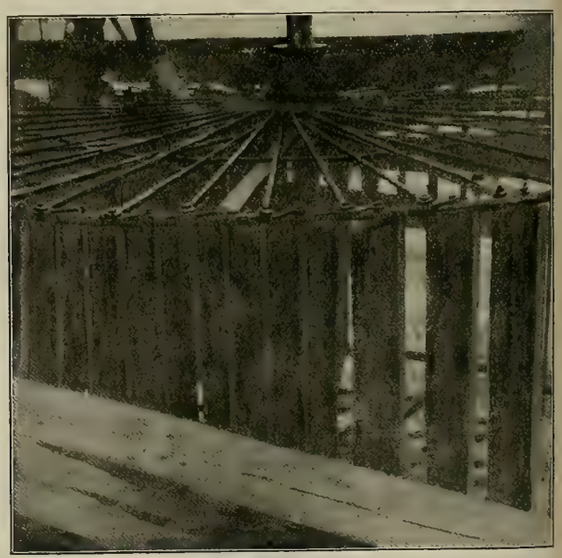


When the expansion is cut up into four parts there is only about one-fourth as much difference in temperature between the incoming and outgoing steam, or about 57° in each cylinder. This difference is easier handled, as it does not cool the steam as much, and if a little reheating is done to the steam between the several cylinders, nearly all the loss from cylinder condensation can be avoided. There is something to be deducted from the saving to be made in this manner, and that is the loss by friction of the many extra cylinders and pistons, valves and connections, and the loss of heat in the reheating of the steam mentioned above. It depends upon surrounding conditions how far the number of cylinders and steam jacketing can be made to pay, hence the difference of opinion among engineers upon this subject—their experiments have not been conducted alike.

VERY little attention has yet been given to the matter of utilizing the waste heat of the exhaust gases from gas engines, in spite of the fact that improvements in this direction promise a not inconsiderable economy. In an average gas engine the escaping gases are heated to about 950° Fahr., and if the maximum temperature be assumed as, say, 2700°, the theoretical efficiency would be about 53 per cent; but if the temperature of the exhaust gases could be usefully lowered to 300° with the same initial temperature, this theoretical efficiency would raise to 76 per cent, with a corresponding increase in actual efficiency. This is sufficient to show what advantages may be gained in this direction; but it is noticeable that the most successful gas engine builders appear to regard the method of external refrigeration as a necessary evil, and make no very serious attempt to do away with it. The case as it stands at present is that, putting aside the losses due to radiation and conduction, which total to about 65 per cent, we have about 17 per cent of the total heat of combustion converted into available power, while an almost equal quantity of heat passes away with the exhaust gases without having performed any duty.

IN a paper read before the Association of Graduates of the Ghent Technical School, Mr. L. Breda described the wet process of extracting copper from pyrites in use near Antwerp. The ore, containing 3 to 4 per cent of copper, is roasted, crushed and roasted with salt. The chlorinated ore in quantities of twenty-five tons is twice washed with 660 gallons of water, then with the waste liquor from the precipitating tanks, then with dilute warm sulphuric acid, and finally with warm water. The washed ore at last contains only 0.2 per cent of copper. The liquor is run into tanks, and the copper precipitated by scrap iron. The amount of copper left in the waste liquor does not exceed 1.4 grain per gallon.—London Mining Journal.

THIS is the Buffalo *Engineer's* recipe for transmuting metals into gold: "Take (1) cold-drawn seamless tubing, (2) tool-steel bearings, (3) hollow rolls of rubber, (4) piano wire, (5) second growth hickory. Make them into a $22 bicycle and sell it for $100.



Chain Bucket Dredge.

The outline illustrations of the dredge boat shown herewith will be of interest to those contemplating the use of such apparatus. This, covering many of the demands of the Alaska-Yukon gold fields, is especially designed for prospecting along rivers, and is made by the Jeffrey Manufacturing Company, Columbus, Ohio. The equipment, ready for work, consists of an elevator, engine and stern wheel drive, with the driving connections for transmitting the power. There are two styles of elevators principally used for dredging purposes, the heavier outfit consisting of a heavy iron ladder frame, with two strands of Jeffrey roller chain and special buckets at intervals of 3 or 4 feet. The elevator is usually equipped with a steam hoisting arrangement for elevating and lowering to suit the different depths of the water, also for drawing it out of the way when its services are not required. The buckets for the heavier outfit are arranged with truck wheels at each end, the latter traveling on a suitable track forming a part of the ladder frame, thus supporting both the loaded and empty buckets and reducing the friction, wear and power consumed. The lighter style of elevator is intended for light service and consists of a wooden ladder with suitable rods and braces for carrying the chain attached firmly to the buckets by means of steel plate attachments, both the loaded and return chains being supported on idler sprocket wheels, a simple and economical construction, adapted to light work and smaller capacities. Occasionally the buckets are provided with teeth to assist in digging. In all cases the Jeffrey roller chain is used. The Jeffrey Manufacturing Company will build parts for dredges, buckets, ladder frames, etc., to suit special conditions and the views of the purchaser, to be operated either by hand or steam power. The power for the operation of this machinery usually consists of an engine and boiler, but any other power can be used, such as electricity, gas, oil, also horse power, if no other is available. Each boat is usually equipped with a chain drive to the stern wheel, which is claimed to be the simplest and cheapest for this purpose. Inquiries from interested parties are solicited and will receive prompt attention. Address The Jeffrey Manufacturing Company, at Columbus, Ohio, or any of its branches.

A New Current Water Wheel.

A new current water wheel, for placer mining and irrigation purposes in the West, is manufactured by the Western Current Water Wheel Co. of Pueblo, Colo.

The wheel is built entirely of steel, and in its construction the turbine principle has been closely adhered to. It works submerged in the water, and the head pressure due to the velocity of the current is held above the wheel. This company claim that they have obtained as high as 85% of the energy of the water. R. C. Osgood of Drummond, Mont., has had in operation one of these wheels since September, 1896. It is used to raise water for placer mining, and its installation presents many unique features.

Herewith appear two illustrations, made from photographs taken at the placing of this plant. On account of the extensive rise and fall of water, the wheel is placed between screws and the power is transmitted by wire rope 300 feet to the two pumps on the shore. The plant is securely anchored to the bank by wire cables, connected to the wheel frame. The wheel is 12x8 and weighs 1800 pounds. It is operated under a 3½-foot head pressure, and, the manufacturers say, furnishes sufficient power to elevate 2000 gallons of water per minute a vertical height of 200 feet. One of the pumps is connected direct to the giant when the mine is in operation, which discharges the water under a pressure of eighty pounds to the square inch. At night the flow from both pumps is turned into a reservoir, and the water thus accumulated, together with that pumped during the day, gives about 500 inches for twelve hours' work. In rivers of low velocity these wheels are placed between cribs, the size of the crib determining the head pressure. In case the bed of the river is sand, piles are driven, so as to outline the cribs, the top of the piles bound together and the intervening space between lines of piling filled with stone. It is claimed by this company that these wheels may be installed at a fraction of the cost of a steam plant of like efficiency, besides doing away with the expense of fuel.

Mining Summary.

CALIFORNIA.

Amador.

Petitions have been filed in the Circuit Court by R. M. Yardley of Philadelphia asking authority to make sale of the Bunker Hill and Mayflower mines at Amador City.

At the Baliol mine a rich streak of quartz was struck in an upraise in tunnel No. 1. The vein is 40 feet wide and prospects well throughout.

The shaft at the Pocahontas mine, Drytown, is down 600 feet in ore. It is the intention to erect a mill after sinking 1000 feet.

The new three-compartment shaft of the Wildman mine is under way.

At the South Spring Hill work is going on in new developments. Drifting is in progress on the 1200 level.

Record: At the Central Eureka, on the 500 level, crosscutting shows ore assaying from $4 to $7 a ton. They are also crosscutting in the 800 level. The shaft is down 850 feet.

In the Columbia, at Plymouth, the water is out, and new pumping machinery will be placed before commencing to sink.

Work on the Lincoln mine, at Sutter Creek, says the *Record*, begins next week. The shaft is already drained to the 500 level, so there will be but 300 feet of water to handle to reach the bottom.

Dispatch: Rain is still needed to enable many of the mills and placer mines in the surrounding country to operate.

The Amelia shaft is down 450 feet, and the rock continues hard.

Work is progressing in the Anita. It is the intention to sink to the 1000-foot mark before further drifting is done.

Butte.

Green & Lodge are running a tunnel on their G. K. mine near Merrimac.

On the Richelieu mine, at Buchanan Hill, a new tunnel is being driven to tap the channel at a point far below the old works. Some overflow gravel is being encountered and the channel will be tapped soon. C. Waldeyer is Supt.

E. J. Murray shipped 4000 pounds of sulphurets valued at $1500 from the Crystal Peak mine, near Enterprise.

Calaveras.

(Special Correspondence).—F. McNear is sinking on the Heinsdorff and drifting on the Red Gold. In the latter he has a vein 18 inches wide of ribbon quartz that shows free gold. Mill tests give an average of $12 to the ton.

D. McDonald has opened up the old Keystone and is taking out good ore. D. H. Roberts has struck very rich ore in the Calaveras Cave mine. Placer mining is hung up waiting for rain.

Murphys, Feb. 21st, '98.

Prospect: The Lone Star, at Douglas Flat, is again running, with plenty gravel in sight and something over 400 carloads on the dump.

The Texas M. Co., after sinking to 105 feet, have uncovered gravel which gives a good prospect to every pan.

The Ohio M. Co., after a month's lay-off for lack of water, have resumed operations, and, according to the *Prospect*, made a clean-up that is very satisfactory.

Del Norte.

The work of reopening the Low Divide copper mines still goes on, preparatory to an examination for the Iron Mountain Co.

Record: In the Big Flat country the weather is cold, with but little snow. The Jones Creek Co. has plenty of water and is piping night and day. The company is finding coarser gold than formerly. The Mains claim is being worked with fair returns.

El Dorado.

(Special Correspondence).—The Spreckels & Mulkey gravel mine at Fairplay, though a paying property, will be closed temporarily pending the return of Mr. Mulkey, who starts for Alaska May 10th in the interest of himself and A. D. Spreckels. Mr. Mulkey will prospect the Kotzebue Sound country.

I have it from reliable authority that one of the St. Louis principals interested in the Pocahontas bond, near El Dorado, says he will not expend any more money on the property. A new 10-stamp mill and compressor were erected on the property, the shaft straightened and retimbered to 400 feet. Some stoping was done and the ore from the stopes only was crushed. Practically, very little new work was done, and no additional sinking has been commenced. The reasons for discontinuing the work have not been made public. The machinery is under attachment and liens. The property is adjudged by practical miners to be of merit, and it is to be regretted that work has been discontinued at the present stage.

The Boulder mine, near Shingle Springs, is proving itself a veritable bonanza. The deeper the work, the better, comparatively speaking, are the ore returns. A 10-stamp mill is in constant operation, and a yield of $300 per day is certainly an excellent product.

Placerville, Feb. 21st, '98.

Harlow & Moherter are pushing development on the Van and Modoc claims.

The Georgetown *Gazette* says that parties are working the old Whiteside, one and a half miles below town. The California Water Co. has a placer patent to the ground, though quartz was known to exist there before the patent was applied for. Scherrer Bros. & Cheek located the quartz and are doing development work.

Nugget: Arrangements have been made to open up the Barnes & Eureka mine on the Greenstone, owned by Robinson & Berry, on the 1st of April.

Kern.

The Wedge people have sent fifty tons ore to the new mill at Johannesburg. The ore is high grade.

A new 10-stamp mill has gone to the Slate range, ninety miles from Mojave and forty from Randsburg, for the Meredith mine. The mine shows a ledge 7 feet in thickness, and part of it is rich, all paying for milling.

The Yellow Aster Co. had 136 men on its payroll last month.

Lassen.

(Special Correspondence.)—The Buckskin has been leased, and work will be commenced soon through the old McBride shaft.

The Hayseed shaft has been completed to a depth of 280 feet and drifting commenced. The vein will be encountered, it is thought, at about 60 feet from the shaft.

J. W. Arnett recently struck a body of ore in the tunnel on the Independent. The claim joins the Evening Star.

Hayden Hill, Feb. 19th, '98.

Mariposa.

(Special Correspondence).—The new mill at the Virginia is completed and will commence regular operations during the present week. Sinking is in progress below the 400 level, where power drills have replaced hand work, and drifting is in progress on all the levels. Development work is resulting so satisfactorily that it is announced the owners contemplate the addition of twenty more stamps to the present mill.

The Louisiana property, which has been closed for about two weeks, has been leased for a term of fifteen months to Doty, Ten Eyck & Pascoe, all of whom were connected with the property when run by the owners. The mill will be started up and considerable exploration work done.

It is reported that the Bondurant tunnel has at last cut the vein at a distance of 850 feet from the mouth of the tunnel and 800 feet vertically below the old workings at the 400 level.

At the Mary Harrison sinking is in progress in the main shaft and at the same time the shaft above the 175 level is being widened from two compartments to three. Drifting is in progress on the 500 and 600 levels.

The Red Banks properties are entirely idle. Very little work has been done since the strike in the Crown Lead vein last December. It is understood nothing more will be done for some months, pending the maturity of the outstanding bonds.

The Tyro is reported as about to reopen. As soon as water can be taken from the shaft sinking will be continued below the 700 level.

Mariposa, Feb. 22nd, '98.

Mono.

The new hoisting works on the Addenda at Bodie are nearly finished. As soon as completed work will be resumed in the mine.

On account of the scarcity of water the Jackson & Lakeview mill will close down. All but five men have been laid off from the mine, and it will probably be two months before they will be put on again.

The Goleta Co. is having a test made of six tons of ore.

Napa.

For the quarter to March 1st the Napa Con. Quicksilver Co. earned $32,212, against $19,161 last year, and surplus after dividends of $12,212, againt $9161 last year. Ætna earned net $12,766 for the quarter ending Feb. 1, and surplus after dividends of $2766.

Nevada.

The shaft at the Providence is down 1950 feet, and sinking will be continued to 2000 feet. A level has been cut at 1930 feet; drifts will be run both ways. Good quartz is being taken out.

The Colfax *Sentinel* says that the Red Dog Co. at You Bet have run an incline 200 feet with a perpendicular depth of 120 feet at the lower landing. From this point a bedrock tunnel of 480 feet was run. Three upraises were made. The second at the 200-foot mark struck gravel at 59 feet. At upraise three, made in the tunnel at 460 feet, gravel was encountered in 16 feet. A prospect tunnel has been started north in the gravel and is in 75 feet. R. E. Linder is Supt.

The dam in process of construction in Greenhorn canyon, one-half mile below You Bet station, by the Red Dog Co., is completed to a height of 39 feet. Its present width across the canyon is 75 feet, and, when completed, will be 150 feet across the top of the dam from bank to bank. The width of the structure is 30 feet, and it is built of massive logs crossing every 4 feet fastened to each other with iron bolts. The main stringers crossing the canyon are fastened in the rock with iron bolts. Rock ballast is filled in as often as a layer of logs is put on. The dam and right of way will cost $3000.

The *Union* reports that within a short time the Spenceville Paint and Copper Works will be in operation again.

The Supreme Court has reversed the decision of the Superior Court of Nevada county in the case of Smith vs. Hawkins. The case is important, as it involves the right to divert water from Wolf creek at the Omaha mine. John Ross, in the early sixties, built a dam and ditch through which water was from time to time diverted and sold to the Horse Shoe Co. Since the litigation commenced, the Allison Ranch Co. extended and enlarged the ditch and derived power to run the mine principally therefrom. The case has been twice tried. Plaintiff sued for 1100 inches of water and got judgment for 289. The case was appealed to the Supreme Court, which reversed the judgment because the ditch had not been used for five years, appellant holding that the right to the ditch and water was lost. On the trial it was shown that during the five years before the suit the Horse Shoe Co. had on three different occasions turned sufficient water on the wheel at the mine to work it. Judge Caldwell held this to be a beneficial use of the water and to save the right from forfeiture.

The *Telegraph*, quoting Supt. Zeitler, who is interested in several mining ventures in the county, says that the Champion is looking better than ever, and they are keeping the shaft going down. In another year, he says, the Champion will be the deepest mine in the county.

Transcript: Five stamps are running at the Chapman Ranch mine on rock of good grade. When the new 30 H. P. electric motor arrives the owners of the mine will increase the number of stamps to twenty.

At the Stanford, bonded to J. H. Neff and others, the shaft is being sunk another 100 feet.

Transcript: The Debris Commission has granted a permit to the Red Dog M. Co. to work its mine at Red Dog. The company has completed its dam in Greenhorn creek and will begin operations at once.

The Brunswick is clear of water and all the miners have gone to work. Rapid work will now be done in taking out ore.

Telegraph: The Wisconsin from forty-two tons of ore made a clean-up of $15 per ton.

Placer.

(Special Correspondence).—Local capitalists have incorporated to operate extensively on Iowa Hill. The company will be known as the Jupiter Consolidated. The directors are R. F. Rooney, T. J. Nichols, C. A. Wickman, W. S. Graham, B. B. Deming. C. A. Wickman (Auburn P. O.) will be Supt.

The property comprises 1¼ mile of channel and is situated one mile east of the present workings of the Morning Star mine. Work will be started within thirty days.

Auburn, Feb. 22nd, '98.

The miners are crying for rain and snow.

Work was resumed last week at the Evening Star on the Heenan ranch, Rock Creek district.

Senator Chapman, who recently purchased the Golden Rule, has commenced work on the property.

Another strike is reported in Ophir district by the Waugh brothers, on the Houchin property.

Brye & Lozano are taking out specimen quartz from their mine in Ophir district.

The statement issued by the Boston office of the Pioneer G. M. Co. for January shows as follows for January and December: Tons rock crushed, 721, 780; value gold bars, $8364, $11,461; payroll, 4169, 4103; bills, $1048, $1518; total expense, $5217, $5621; net earnings, $3147, $5839; average value of rock, $11.60, $14.70; men employed, 49, 49.

Having an abundance of water now and their restraining dam finished, hydraulicking was commenced at Lost Camp mine, near Blue Canyon, at the beginning of last week.

The tunnel in the Azalea mine is nearing the 700-foot mark.

Sentinel: The Herman quartz mine, near Westville, will place a pump and machinery for sinking. The 10-stamp mill is working to its full capacity. The lower tunnel strikes the ledge 400 feet below the present works.

Plumas.

Bulletin: Beach & Co. will resume work as soon as spring opens, in the Elizabethtown Channel mine near Quincy.

Independent: An upraise is being made in the Green Mountain mine at Crescent Mills from drift No. 5 to drift No. 4, a distance of 400 feet, following a body of ore which is heavily mineralized. This upraise will be 6x13 feet in the clear of timber and ladder way.

San Bernardino.

A deed was filed February 13th wherein J. A. Comer, K. A. Comer, J. K. Hawk, A. Hawk, G. H. Parker, D. Gillelen and G. Borden convey to G. W. Brown a one-eighth interest in thirty-two borax placer mines, for a consideration of $268,800. The mines embrace a territory of 4480 acres, and are located in the Brier mining district, Salt Lake valley.

The work of construction now on the new line of railroad from Daggett to the borax mines, twenty-six miles away, is being pushed rapidly. The borax works are shipping forty tons per day and the road is a necessity. A 32-mule train is at present hauling the product of the mines to the railroad.

San Diego.

The North Star mine at Julian suspended operations for the present and made a satisfactory cleanup. The owner is erecting a mill and after its completion will resume operations.

San Luis Obispo.

A San Luis Obispo paper states that three men have located the quicksilver mines which were worked years ago by A. Blochman & Co., and will put in a small retort for the present; but within sixty days will put in a retort costing $1000, and of a new patent, which prevents the quicksilver from evaporating and passing off with the smoke.

Shasta.

Paige, Small & Russell have been taking good ore from the old Lucas mine near Shasta. The ore shows galena sulphurets.

Hitchcock & Hudson struck a 3-foot vein in the Electric Light, near Shasta, which assays from $19 to $100. They have fifteen tons of high grade ore on the dump.

Collins & Blagraves took out $20,000, on a lease, from the old Washington, above French Gulch. The Washington is the pioneer quartz mine of northern California.

The Niagara has suspended operations for a time.

At the Milkmaid twenty-five men are employed. The 4-stamp mill crushed 350 tons last month.

Work is being pushed on the tunnel at the old Bell mine, at Sunny Hill. It is in over 200 feet.

The Mt. Shasta mine is employing fifteen men. They are taking ore from the north and south drifts. It is sacked and shipped to Keswick.

The Mammoth reports a strike made in a tunnel, which is in 148 feet, of a deposit of native copper. The Mammoth is a group of twenty-two claims, situated a few miles west of Kennett.

Saeltzer, Jaegel & Kahny, owners of the Mammoth group of mines on Little Backbone creek, have bonded the property to W. Forstner of New York City. A drift has been run for 200 feet, in which some good ore was encountered. The ore carries a fair percentage of copper.

The timbers in the tunnels and air shaft at the Minnesota mine have been repaired. The mill will shortly resume.

Free Press: The Three Sisters mine, near French Gulch, is producing a good grade of ore. The property was recently bonded by Ellery Bros. to Howell & Motherwell of San Francisco.

Sierra.

(Special Correspondence).—The South Fork Co. has finally come into a large body of good pay gravel and is bringing through the long tunnel with steam engine and a train of ten cars. The weather is moderating, and the company expects soon to have sufficient water for a continued washing. The dumping basin is large, in keeping with the workings of the company, which has carried on operations systematically and on a large scale.

Forest, Feb. 21st, '98.

Messenger: Kimball and others, a short distance from Goodyear Bar, struck good gravel. From ninety-two carloads of dirt $1050 was realized, over $11 a load.

Siskiyou.

At the King Solomon mine, four miles from Cecilville, twenty men keep an 8-stamp mill running day and night, crushing twenty-five tons per day. F. W. Fletcher of San Francisco is Gen. Mgr.

The miners all along the river gulches are still complaining of shortage of water. This season thus far has proved to them very unprofitable.

Ball, Travers & Johnson are mining on Six Mile creek and accomplishing rapid development work.

G. J. Main is opening a river claim on the Klamath, in the Ash creek section.

Trinity.

On the Bloss & McCleary hydraulic mine, Trinity Center, a cut 2400 feet long and 5 feet deep has been made for a tail-race. This, when completed, will be from 18 to 25 feet deep. Two hundred sluice boxes will be put in the cut.

Journal: The first payment has been made on the Chloride group at Canyon Creek and the new company has taken possession.

The Jim Fizz mine is running with a good supply of water and getting off a large amount of gravel.

The La Grange has a force at work, and in six weeks they will have their large tunnel completed and have water the year round.

Tulare.

Twelve tons of rock from the Talc mine at White River milled $9 to the ton.

The Portuguese mine at Kernville will be worked by M. Orton and 100-foot shafts sunk.

Tuolumne.

The Santa Ysabel is still without water to run the mill in full. Ten, fifteen or twenty stamps are worked, according to the water supply; the company is earning all expenses, including those for development, and is out of debt, with a treasury surplus of about $10,000.

The *Independent* says that the Columbus is systematically developing the property and a mill is soon to be erected.

The Keltz is running its 15-stamp mill. Last week a large body of sulphuret ore was struck.

The Tom Evans and Hazel Dell group has been reopened and the tunnels cleaned out.

San Francisco people have unwatered the Perrau mine at Soulsbyville and are developing it.

Magnet: The No. 2 shaft at the Trio is down 330 feet and prospects continue encouraging. In No. 1 shaft they are drifting on the Trio and Mooney veins.

The Bonanza, near Sonora, expects to be working a full force at once, as the water supply is sufficient to run the compressors. The developments hereafter will be confined strictly to the deep shaft.

At the Harriman, near Jacksonville, the new hoist is in operation.

Independent: On the Mountain Lily there are five veins, all gold bearing. This property is developed by two tunnels. The only thing needed is a mill. The ore dumps contain good ore. The mine is in readiness to stope between the two levels opened. The property has 200 inches of live water with a vertical fall of 600 feet.

At the Trio both the north and south shafts are sinking.

At the Tarantula sinking the shaft continues.

The Hancock, below Rossland, has struck a body of ore that prospects well.

The Alameda is drifting and sinking. Good milling ore is coming to the top.

At the Jumper the electric plant was started last week, running the compressor. Four power drills are in operation.

The Rappahannock's shaft is 750 feet and will be continued until the 1000-foot level is reached.

At the Dutch mine the mill is running full capacity. Drifting, stoping and sinking are progressing.

The Grizzly mine is crosscutting and sinking.

The Dead Horse is contemplating sinking the shaft to further depth. The mill is running day and night.

Democrat: The main shaft in the Tanzy has reached 180 feet.

Ventura.

The Ventura *Journal* says that work is be-

ing done on Sulphur mountain for the delivery of thirty tons of crude sulphur daily from the sulphur beds, nine miles from Ventura. The one now being uncovered is 60 by 240 feet, and there are several other beds, one much larger.

NEVADA.

The De Lamar Co. made another successful cave-in in their mine last week. The blast dropped a body of ore estimated to contain 20,000 tons, a distance of 15 feet from the surface to the stope. The ore dropped has been standing for some time between the old workings and surface. This is a new departure in mining by caving, and the De Lamar Co. so far has made a success of it.

The ore in the Standard at Mountain City is a carbonate carrying gold. The early prospectors looked for horn silver and chlorides. In one pile of 100 tons on the dump of this mine, the lowest assay, the owners claim, was $68 in gold and $3 in silver.

The Star mine at Cherry Creek is running sixty tons of crude ore daily, productive of from ten to twelve tons of concentrates.

The Dayton *Times* reports that Tailleur & Moore have a contract from the Isis M. Co. to complete the drain tunnel started some years ago. This new tunnel will be 300 feet long and is expected to tap the winze of rich ore above. In sinking the winze in this mine the ore paid $1000 to the foot for a depth of 60 feet. Water was then encountered and work suspended.

Two carloads of antimony were shipped from Mill City last week to Chicago.

The Wells *Herald* states that the Delano group of copper claims at Salmon has passed into the hands of an English company under a bond of $65,000. A smelter is to be erected and machinery for a hoist is on the road. Work for 100 men is assured.

The Tuscarora *Times-Review* says that the Dexter is keeping both of its mills running steadily.

On the Yuba mine and Pacific tunnel, at Pioche, the Godbes are employing forty-five men, making periodical shipments of high-grade ore, and operating a 10-stamp mill continuously.

OREGON.

C. P. Thore has bonded the hydraulic mine, at Waldo, and begun work. A. N. Ashley is Supt.

The Rocky Gulch Mining Co., at Galice creek, is paying $100 per day, but the water supply is limited and work days are scarce.

The Helena mine, at Bohemia, owned by R. J. and P. J. Jennings, will build a 10-stamp mill next month.

J. W. Cook, owner of the Musick mine, near Bohemia, proposes erecting a 30-ton smelter

At the Bonanza, near Baker City, the crosscut has reached 1200 feet. This tunnel exposes a vein 80 feet in width and the footwall has not been reached. The drills are also pushing at work in the shaft. The recent development has furnished enough water to run a hundred stamps and this is the number, says the *Democrat*, that will be put in at the Bonanza next summer. The 20-stamp mill is kept constantly at work. The ore is transported from the mine to the mill by a half-mile tramway, which, at the completion of the new 3000-foot tunnel, will be supplanted by an electric railway.

Men are bailing the winze in the Robbins-Elkhorn mine, near Baker City, preparatory to an examination by Eastern people.

The Baisley-Elkhorn shaft is down 110 feet below the lower drift and the ledge has been crosscut and drifts started north and south. As soon as the stopes can be opened the mill will start for a continuous run.

A mill is to be erected at once on the Rachel, four miles east of Baker City, of which J. Wallace is Supt. The capacity of the mill has not been decided upon, but it will be of ten or twenty stamps.

J. Hughes has bonded the Badger property in Grant county to San Francisco parties. They are proceeding with development work.

Republican: Bradbury Bros., owners of the Gordon mine, Baker City, have struck water at a depth of 87 feet, to be utilized in a stamp mill. The Gordon has a good body of ore exposed, and the only question was a supply of water. This having been solved assures the erection of a 10-stamp mill.

Tidings: A large dyke between Wagner creek and Arastra gulch, and from 400 to 600 feet in width, has been discovered near Ashland. As far as prospected and assayed it runs from $2.50 to $28 per ton, carrying cinnabar and silver.

Garvin & Co. are working the old Pilgrim mine near Ashland. A crosscut tunnel that will tap the ledge at a depth of 150 feet is being driven and will be in by the first day of April. If the ore is as rich at tunnel level as on top reduction works will be put on this summer.

One hundred tons of ore from the Ashland mine are being brought to the Hicks mill for reduction.

The Rocky Gulch mine turned out $400 in gold last week, the result of a few days' run and a limited water supply.

W. G. Ingels, who bonded the Alford quartz ledge on Galice creek, Ashland, is driving a tunnel to tap the ledge about 100 feet below the surface. Should the ledge continue to show up as well as it has been doing a 5-stamp mill will be put upon the property.

WASHINGTON.

The Echo, near Pierre lake, on the Colville reservation, is reported to have tapped a strong lead of shipping ore in the crosscut tunnel, which is in over 70 feet.

The M. R. C. Co. of Bossburg shipped 500 pounds of ore from its claim on Bruce creek to the smelter last week. The ore has been running about $60 per ton on assays.

O. J. Collins of Bossburg says there are 200 men at work near Bossburg this winter. In Stevens county and on the Colville reservation fully 2000 claims are being worked and all are showing well.

The Bossburg *Journal* says that scores of prospective townsites on the reservation are staked and held as mineral claims, and all the enterprising locators think they have the foundation for a second Butte.

Work has begun on the tunnel on the Q. S. claim near Loomis. The tunnel will be pushed to crosscut the ledge. It will require 300 feet to tap the ledge at a depth of 600 feet.

The Republic mine, at Republic, which struck good values at a depth of from 50 to 150 feet, was low grade on the surface. Now the men are cutting through an ore chute which is said to give sample returns of from $100 to $300 to the ton.

On the San Poil, near Republic, eleven men are working. The ore body is from 7 to 8 feet wide.

On the Little Cove, near Republic, J. Bourne, Jr., has 17 feet of ore on the surface. The claim is developed with a 140-foot shaft and a drift at the 125-foot level. The Mountain Lion is another claim owned by Mr. Bourne. On this he is running a 700-foot level to tap the vein at 500 feet.

The United States Marble Co., operating the onyx and marble quarries near Valley station, has opened up a body of onyx for a distance of 50 feet into the bluff showing all the tints of the rainbow.

The Niagara shipped fifteen tons of ore.

The tunnel on the California is 100 feet and driving to crosscut one vein at a distance of 225 feet and a second 300 feet. There are two shafts, one to a depth of 25 and the other 40 feet. The mine is two and a half miles from Northport.

BRITISH COLUMBIA.

The Minnehaha mine, in the Cariboo camp, Yale district, will shortly erect a stamp mill and air compressor drills. Ainsley McGraw is Mgr.

Donald McKay of Fort Steele proposes buying a 20-stamp mill.

The St. Eugene mine, in the Fort Steele district, is to build a 300-ton concentrator next month.

O. Johnson has given a $30,000 option on four claims near Rossland. On one of these there is a 22-foot quartz lead, giving assay values as high as $28 in gold and an average surface assay of $8.

Six hundred and fifty-four tons of ore were shipped last week from Kaslo.

The Black Eagle, near Rossland, was sold to the B. A. Corporation for $10,000.

News comes from the north, says the Spokane *Review*, that the Omaha & Grant Smelter Co. has suspended operations in the Kootenays and closed all plants in which it is interested. The motive is not known and the action of the company occasions surprise, as their operations were considered profitable. They have been running the concentrator at Pilot Bay and the reports have been that plenty of ore was handled and that the smelter might be expected to blow in any time. The expected blowing in has long been promised but never materialized. The concentrator was closed down this week. The company has been operating the Lucky Jim mine in the Slocan, and this has been shut down and the men discharged. The Tariff mine in Ainsworth camp, also owned by the Omaha & Grant people, has been producing a high-grade galena ore. The pumps were drawn last Wednesday and the mine is filling with water.

THE KLONDIKE.

C. Green, who has just returned from the Copper river, says that the Indians on Copper river do not bring down great chunks of native copper, and if there is gold on the upper waters of that stream, it is yet to be discovered in paying quantities. "I made careful inquiry of mining men, trappers, traders and Indians, and am thoroughly convinced that there is little to the fairy stories which have been told about that country.

"The Stick Indians come down the river to trade at the stores around the mouth of the river. They are friendly, and want the white men to come into their country. They have copper ornaments, but they bought the metal from traders. White men who have prospected up the river report that they found a little fine gold, but not in paying quantities.

"About 150 men have been wintering around the mouth of the river, waiting for the ice to form so that they could go up the stream. Half of those are returning, having sold their supplies at a sacrifice. The others are struggling up the stream against tremendous obstacles. Each man has from three to five sleds, each loaded, on the average, with 300 pounds of supplies. These they are pulling laboriously up the river on the ice. There is about 18 inches of slushy snow, and it is necessary for men to go ahead on snowshoes and break a path for the sleds. Only a few miles can be made by a day's hard work. The method is to pull one sled a few miles, leave it and return for another, repeating this until all the sleds have been brought to that point.

"Copper river flows into Prince William sound. The delta is forty miles across at the mouth, and the country there is a vast mud flat. It is impossible for vessels to land at the mouth of the river. The chief landing place is at Orca, on Prince William sound, forty miles from Copper river, and from that point you make your way across to Alganak, on Copper river.

"It is seventy miles from the mouth of the river up to the glacier. Beyond that little is known of the country. The Stick Indians come down to traffic, but they say they know nothing of mineral up the stream. About a year ago two white men, Duval and Donahue, went up the river about 200 miles, but they found only a few fine colors.

"A party of 100 men are now at Valdease, north of Orca, at the extreme head of Prince William sound. Their scheme is to cross the heavy glacier which runs along the coast for a great distance, through which the Copper river has cut a channel. They hope in this way to strike the Copper river 170 miles from its mouth. This glacier is thirty miles across. It is a visionary scheme. Hardy and experienced men, traveling light, have tried it and failed. They were turned back by great cracks in the glacier, from 50 to 150 feet wide.

"The great majority of the men going to Alaska have no more idea than the man in the moon of the hardships they are running up against."

Three steamers sailed from San Francisco this week crowded with men and supplies for the Klondike via Dyea and Skaguay. No steamers or sailing vessels have been reported lost or foundered since the wreck of the Clara Nevada. Regarding the ruling of the Treasury Department in relation to the transportation of goods across American territory and en route for Klondike published last week, their essence is that a man reaching Dyea or Skaguay with Canadian-bought goods must either pay brokers' fees and cost of a bond, or deposit money sufficient to cover the same at the port of entry, and then upon arriving at the British line he must send back his release of the bond or a certificate in order to get his money back, or pay $6 a day for an escort through American territory.

Late Skaguay arrivals tell of a blockade of the Dyea trail by miners and packers, who resisted a detachment of United States infantry when the soldiers claimed the right to go over the trail before them.

Stewart Menzies, the Alaska Commercial Co.'s agent at Forty-Mile, Alaska, arrived in San Francisco last Sunday direct from Dawson. He and his party of five, with a boy five years of age, left Dawson January 20th, way over the Skaguay trail, arriving at Skaguay February 10th. He brought a sample of gold, worth $65, which he took from one bucket of dirt from Claim 18 on El Dorado creek, in which Rudolph Neumann owns one-fourth. Speaking of his trip and the recent discoveries in the now famous gold fields, he says no important discoveries have recently been made near Dawson, though rumors of rich strikes were frequent. Henderson creek and the Stewart river district give promise of becoming good camps. "We found between 300 and 400 men wintering there when we passed on our trip to the coast. Nearly all the recent discoveries of any value have been made on American territory. We had a stampede lately to American creek, fifty miles below Forty-Mile. The claims there are summer diggings. They are shallow, from 3 to 4 feet deep. The miners sluice the top of the ground and take out from $5 to $20 in dust to the pan. Chicken creek, Napoleon creek, Davis creek and Walker's Fork, all on American territory, show good prospects. These are tributaries to Forty-Mile creek. Chicken creek prospects yield $9 to the pan in average. Miller and Glacier creeks are tributaries to Sixty-Mile. They are old creeks, having been discovered in 1887, but still show good paying gravel. I had a letter from two friends of mine the day before I left for the coast, who are working their claim on Glacier, informing me that they take out $100 a day.

"I met Major Walsh, Commissioner for the Yukon country, Febuary 3rd. He said that he would have 40,000 pounds of provisions in Dawson as soon as the ice in the river broke up. He intends to open a trail and was on his way to Dawson to make arrangements, so that he could establish the Dalton trail on his return and keep it open and protected by mounted police. There is no longer any danger of famine at Dawson."

According to local reports, J. C. K. Van Ee, who bought the Royal mine at Copperopolis, Cal., for $400,000, which was reported in this paper Dec. 4, '97, bought four placer claims in the Klondike last week for $240,000—92, 93, 95 and 82, located on Bonanza creek "above Discovery." The first three were bought from Barnes and Dobson and claim 82 from T. B. Straven, all of Dawson. None of them have reached the bedrock. There is a demand for such property in London.

Every ship and craft returning from Skaguay and Dyea brings back would-be Klondikers who, discouraged and disheartened by finding their gauzy day-dreams vanish on the first encounter with the ice and snow of an almost arctic winter, have turned again to civilization, sadder but wiser men. It is from these people that the true conditions are learned.

There are hundreds of people in Dyea and Skaguay out of work, out of money and every day growing more desperate. Notwithstanding the fact that every vessel leaving for Alaska is loaded with every pound of freight the law will permit her to carry, hay in Skaguay and Dyea is selling for from $60 to $80 per ton, lumber from $40 to $50 per M., fresh meat 40 cents per pound and other things in proportion. There are thousands already there who, finding it impossible to proceed, have not money to return nor the means of procuring a livelihood. Most of those who have gone over the passes this winter are camping on the other side, awaiting the spring break-up, which will be about April 1st. Recent reports also chronicle the prevalence of sickness.

IDAHO.

In the Warren and Florence camps eighteen new mills are to be built this summer.

The Golden Star, at Hailey, is taking out twenty-five tons of ore a day. H. Allen is Supt. The company contemplates building a 20-stamp mill.

There are 1500 men employed in the mines of the South Fork district, near Wallace. The daily pay-roll coming direct from the mine owners is not short of $7500. The mine owners' pocket dividends amount to about the same sum. The product this year will, it is estimated, exceed $15,000,000, of which one-third will be dividends.

There is more ice in Snake river than there has been for many years past, and all mining operations have stopped from American Falls to Weiser.

The clean-up in the DeLamar mill, at DeLamar, following the tearing out of the old pans and settlers and gathering up the waste and losses of many years run is estimated to yield $20,000.

The *Nugget* says the total output of the DeLamar mines since in the hands of the present Co. has been in excess of six million dollars. To this may be added the million or more taken out by Capt. DeLamar.

Five bricks of gold and silver came from the Cumberland mine near Silver City. Four are largely silver, but have enough gold to make them worth $3 per ounce. The fifth is mostly gold and is valued at $12 per ounce. The metal was the product of a test run of twenty tons of ore through an arrastra.

Five additional stamps are to be purchased for the Idaho Con. G. M. Co. at Warren.

F. R. Culbertson, Mgr. of the Con. Tiger & Poorman Co., in his report shows that during the ten months the property was operated 91,089 tons of ore were mined, which produced 15,819 tons of concentrates, worth $431,879.87 above freight and smelting charges. The expenses of the year, including about $15,000 for new machinery, were $292,835.78, leaving a net profit of $139,044.09, or over $15,000 per month, exclusive of additions to the plant. The Tiger-Poorman pumps 3000 gallons of water per minute, which together with the crude ore, was all hoisted 1200 feet or more, and the water was steadily pumped for the two months before the mill was ready to run, making it the most expensive to operate of all the Cœur d'Alene mines.

The Morning and You Like mines have 279 men on the payroll. Improvements will be made in the spring, requiring an increase.

At the Lucky Boy, Custer City, ten stamps are dropping, and twenty-seven tons daily are put through the mill, which is steadily turning out gold and silver bullion. There are sixty men on the pay-roll, with assurance that this number will be doubled the present season. The company now has under consideration the erection of an auxiliary plant with which to cyanide the tailings.

UTAH.

A company is being formed, says the Bingham *Bulletin*, to operate the leaching plant lately started by the Fred Mueller Co.

The Daly Mining Co. during the past year marketed ore and bullion of the value of $171,471.71, distributed a dividend in the sum of $37,500 and closed with a cash balance amounting to $36,199.37.

The La Cigale incline at Mercur is down 540 feet, where the vein has widened to 21 feet.

The Grand Central, of Tintic, shipped four cars of ore of a net value of $40 a ton. This makes a total of twelve cars in the last ten days.

The Eureka Hill is reported to have marketed 1,000,000 ounces of silver in 1897.

A shipment of gold cyanides of the value of $20,000, was made by the Mercur last week.

Tribune: The tunnel on the Herschel mine in Mercur has been driven 2200 feet and is still pushing ahead. The ground is getting softer and the cost does not exceed $7.50 per foot.

Two strikes were made in the Mammoth last week in the Finn tunnel and in the extreme north workings of the 700-foot level.

The Betsy stope, from which ore of the value of about $1,000,000 has been taken, caved three years ago, and since that time the ground has been permitted to lie idle. A short time ago Supt. Earls decided to extend the tunnel farther north in the Golden King claim. The breast of the tunnel was then about 280 feet north of the Betsy stope, and, pushing on 20 feet farther, a shot uncovered ore that in the furnace showed two ounces gold, forty ounces silver and 30 per cent copper, or a valuation of over $110 per ton.

The latest discovery in the Red Wing, at Bingham, exposed a foot of ore assaying 13 per cent copper, thirty-two ounces silver and $3.60 in gold.

During the past year the concentrator of the Eureka Hill Co. put through 60,000 tons of ore, while 2000 tons of crude ore were sent to the smelter. From 85 to 90 per cent of the values consisted of silver, while the remainder was about equally divided between gold and lead.

The Flush mine, Granite mountain, made its first shipment, netting, after wheeling it by wagon 105 miles, $35 per ton. The ore contained 70 per cent lead in addition to fair values in gold and silver.

The Niagara Co. shipped six cars of ore from the Spanish mine at Bingham. The lot showed 38 per cent lead in addition to small amounts of silver and gold.

A carload of ore from the West Argent, at Stockton, yielded forty ounces silver and 45 per cent lead.

Hall & Wooten have bonded the properties of the Capitol Gold & Silver M. Co., among them the Gold Blossom, near Sunshine, for $12,000. They will commence work March 10, and should it prove satisfactory, they will purchase the properties and pay therefor $12,000.

Record: The Ontario tailings dumps, at Park City, are to be worked in the Marsac mill. To run them at the rate of 100 tons a day will require about a year and a half's time.

MONTANA.

At Gilt Edge, Fergus county, the mill is handling eighty tons of ore per day. The ore is low grade, but, when worked in large quantities and under careful management, is bringing good returns. Sixty-five men are employed.

The Philipsburg *Call* says that a stamp mill is to be erected on the property controlled by D. Birran, Moose Lake district. The most important deal made in the district is that involving the copper lode, eight miles from Moose lake. It has a crosscut for a distance of 65 feet and has but one wall. Last week the property was bonded in the sum of $200,000 to Chas. Houck and others of Anaconda. While official word was not given out, it is stated with every apparent element of truthfulness that the Anaconda Copper M. Co. is the party that holds the option on the property.

A shipment of high-grade ore from the Little Giant was made from Townsend.

The board of directors of the Iron Mountain

mine in Missoula Co. announces that it has given up the mine, and, for the time being, its adjoining claims on which prospecting has been pushed. Since 1889 the property has produced $500,000 in dividends. The company proposes to develop other properties.

A vein of coal of considerable extent has been discovered on Blubber creek, in the vicinity of Augusta. Miners are at work opening it up.

The Butte at Radersburg continues to ship a car of ore every six weeks.

The Sarsfield and Eureka claims at Boulder have been bonded for $40,000 by W. L. Hardie, representing a company at Cleveland, O. Machinery will be placed on the property at once and the claims thoroughly developed.

The Gold Flint at Sylvanite has encountered between the 100 and the 150-foot levels an ore body that varies from 30 to 36 inches. It is galena, and the lowest assays have been 90 to 136 ounces of silver, 20 to 60 per cent lead and 7 to 26 ounces of gold. It averages over $100. The 20-stamp mill is turning out 60 tons per day, 90 tons of concentrates a month.

A strike of good ore is reported from the Le Roi claim at Saltese.

Pocket: A contract has been let to have the material on the ground by March 1st for another gold dredge on the Clark's Fork at Red Lodge, making the second large dredging boat on the Clark's Fork, besides the stationary steam plant operated by J. H. Bigger. The Dietrich dredge will start May 1st.

The Fortune group, six miles from Virginia City, has a shaft on the vein to a depth of 200 feet, the vein averaging 7½ feet in width. A tunnel below the shaft is run on the vein 800 feet. The ore carries gold, silver, lead and copper, the average values per ton being gold, $20; silver, $10; copper, 20 per cent, and lead, 35 per cent. There are 1000 tons of ore on the dump.

F. B. Linderman, near Sheridan, has uncovered a 12-foot vein giving an average assay of $25 to the ton in gold.

The 60 stamps of the Kennett mill are dropping on Kennett ore and the largest gold mill in the State is in operation. Two hundred tons of ore are milled daily.

The output of the Parrot for the year ending May 31, last year, was about 20,000,000 pounds of copper. The Parrot Co. owns nine claims in the vicinity of the Anaconda, Boston & Montana and Butte & Boston companies. Attention has been given only to the production of its copper. The company paid $500,000 for a new smelting plant at Gaylord out of its earnings. The capacity of the old smelter was 400 tons a day. The new smelting plant is arranged for a capacity of 800 tons daily. It is expected that the operation of the new plant will save from $100,000 to $200,000 per year by the use of water instead of steam. The refining plant at Bridgeport, Conn., which cost $500,000, has a capacity of between 3,000,000 and 4,000,000 pounds of refined copper per month. The Parrot Co. places the value of this plant on its books at $500,000, although it pays 20 per cent in dividends.

Two mining cases are on trial before the United States Court at Butte, both against the Heinze corporation, the Montana Ore Purchasing Co. One is brought by the Boston & Montana Co. for a half million dollars damages for ore alleged to have been extracted from the Pennsylvania mine through the workings of the Rarus by the defendant corporation, and the other is similar in its nature, for the sum of $150,000, brought by E. R. Morse for damages on account of the alleged extraction of ore from the Michael Devitt claim, also through the Rarus workings.

SOUTH DAKOTA.

The Hercules M. Co.'s shaft, near Deadwood, is 60 feet and still in hard trachyte.

The Golden Queen has been working on upper Deadwood gulch all winter. A ledge of ore has been opened that assays $14 per ton in gold.

Burns & Little are working on the Smoky City at Garden City. They ship six tons of ore a day, which averages $20 per ton in gold. The owners of the Harrison mine on Blacktail divide are shipping three tons a day.

The Holy Terror gold mine in the Black Hills produced $15,000 each month during 1897 from a 16-stamp mill. The surface richness did not hold out and there was a barren zone for some distance, but the company went on down in a plucky way till the 500-foot level was reached, when a big body of ore was reached from which $180,000 was taken last year.

WYOMING.

J. I. Cowan, representing H. Seton Karr, M. P., and other English investors, has bought the Charter Oak copper mine, near Grand Encampment, for $30,000. The purchasers have been operating the mine under a lease for five months. They have driven 200 feet of stope and have several thousand tons of ore on the dump.

MICHIGAN.

The Belt Group, comprising the Belt, Knowlton, Mass and Adventure mines, have been sold to A. B. Turner & Bros., Boston, for $400,000. The mines will be reopened and vigorously worked.

The annual report of the Quincy M. Co. for 1897 shows: Average force employed (men), 1066; average number of miners, 393; average wages of miners on contract per month, $52 52; yield of mineral per fathom of ground broken, 587 lbs.; yield of refined copper per fathom of ground broken, 481 lbs.; total rock mined, 632,867 tons; total rock hoisted, 568,822 tons; total stamp rock hoisted, 542,623 tons; product mineral from stamp mill, 15,429,725 lbs.; product mineral from rock houses, 5,200,900 lbs.; product refined copper, 16,924,618 lbs. The total depth of shafts sunk was 642 feet, and of winzes 925 feet, making an aggregate sinking of 1567 feet, Number of feet drifted was 11,957. Amount of ground broken, 632,867 tons.

News Bureau: It is figured that the cost of copper to Quincy M. Co. in 1897 was 6.91c per pound, compared with 6.57c in 1896, 6.38c in 1895 and 6.75 in 1894 which figures include construction charges. The company appears to have received for its copper in 1897 an average of 11.06c, 10.92c in 1896 and 10.18c in 1895.

COLORADO.

Work will be begun on the Aspen Fraction in a few days with fifteen men. Clarence Stamm has leased the property. There are 500 feet of open workings available and a good grade of ore can be mined.

G. W. Davis of Chicago has closed a deal for 2500 acres of placer ground in the South Pass district.

Returns from the last carload sent out last week from the Modoc on Bull hill show that the ore ran thirty-seven ounces in gold and twenty-nine ounces in silver.

The Kirk tunnel at Sunset is in 1200 feet, the breast of which shows an 8-inch streak of iron ore averaging $46 per ton.

Jain & Spellman sold the Homestake group, consisting of six claims and millsite, for $12,500. Work on the property begins at once.

The O. & N. at Ouray shipped seventeen carloads of ore last month.

The Portland paid its monthly dividend of $30,000 on the 15th inst., making a total of $1,327,080 paid to date. The report of the treasurer at the annual meeting showed a cash balance in the treasury of $306,956 85; the receipts for the year were $1,003,140.36; the expenditures $873,335.39; the company paid in dividends $360,000; the average net value per ton of the ore handled during the year was $52.70 against $38 per ton for the year 1896, or an increase of $14.70 per ton.

The Ruby mine, near Boulder, shipped twenty-four tons of ore, half of which is first-class. Mgr. Harrison states that $18,000 has been taken out of this mine the past six months. The smelting ore runs about $100 per ton, while the second-class brings about $50.

In the drifts and stopes from the 350-foot station on the Johnson, at Cripple Creek, the lessee has an ore chute from 8 to 15 feet wide, running from $60 to $100 per ton in carload lots.

In the Hallett & Hamburg, at Victor, in driving the drift south 50 feet from the shaft at the 300 level, a body of ore oblong in shape and about 40x50 feet in size, all of smelting grade, was encountered. A shipment of a ton of this ran better than 220 ounces. A stope in this chimney is up 30 feet, and there is no change in the grade of the ore or in its dimensions. In drifting west at the 200 and 300 levels considerable ore of a better grade than two ounces is being broken.

The Solid Muldoon, at Idaho Springs, instead of drifting from the surface, will erect a plant of machinery and the shaft sunk another 200 feet.

Mgr. Branstetter says that a plant of machinery will be placed at his Train Run property, near Idaho Springs, early in March. Compressors and air drills are to be used.

The Black Lion mine, Clear Creek county, has a good grade of mineral on both sides of the shaft, and shipments of $100 ore are being made.

During the time the Ibex Co. has had control of the Little Johnny, it has produced, as nearly as can be estimated, $8,000,000. The dividends paid will amount to $4,000,000. In the mine there are ninety miles of workings, all in ore. The ore carries gold, copper and silver in quantities, and the output shipped to the smelters is 325 tons daily. The ninety miles of underground workings are equipped and thoroughly fitted out with electric lights.

The Abe Lincoln, at Cripple Creek, has opened a body of ore in one of the old stopes above the 300-foot level, about 14 inches wide, giving an average assay of five ounces. A fifteen-ton shipment was made last week. They are lowering the water to the 350-foot level, and expect to be breaking ore at that depth in a few days.

King & Woddleton, in the 115-foot level, on the Geneva at Cripple Creek, are sinking a winze from shaft No. 2 on 3 feet of good ore, much of it showing sylvanite, from which they made a shipment this week.

J. Waters cut into 2½ feet of almost solid galena in his shaft on Gold Hill last week at a depth of 170 feet.

Henselman & Co., on Raven Hill, have sent out their second shipment, consisting of ten tons, estimated at three ounces, and have 3 feet of good grade ore in the bottom of their 40-foot shaft.

A shipment of twenty tons of $70 ore was made last week from the Pickup lease on Bull Hill.

Denver *Republican*: The Tom Boy mine, at Telluride, is employing between 100 and 200 men, and increasing its force. The Japan mine is taking out good ore and working 100 men. It takes 300 miners to operate the Smuggler-Union. It is shipping ore, and the 60-stamp mill on the property is stamping out almost 200 tons per day. The Mount Wilson M. Co., perhaps better known as the Silver Pick, is employing 125 men.

On the Meldrum tunnel, one of the greatest of its kind in the world, work was commenced about three months ago. It will require four years to complete it. The cost of driving it will be between $4,000,000 and $5,000,000. The work is being done by a Scotch company. The use of air drills has been commenced at the Telluride end. From the Telluride side the point of exit will be about half a mile above Ironton, Ouray county.

Reporter: Drifting is continued on the Mab shaft of the Big Chief and Castle View properties at Leadville.

The Bonner at Silverton has produced this winter 145 sacks of free gold ore and twenty tons of sulphide ore.

The Gilpin & Cripple Creek G. M. Co. has bought the Montgomery mine in Gilpin Co. The transfer was made last week. This is one of Gilpin's old producers. The main shaft is about 300 feet deep with 1500 feet of levels. The vein is 4 feet, with a good grade of mill dirt, and the smelting ore averages $35 per ton.

The Venture mine at Leadville is operated by the Brussels Leasing Co. A large amount of low grade milling ore has been shown up.

Denver *Record*: The quantities of pay ore found in the 800-foot level of the Portland tend to disprove the theory that the Cripple Creek ore bodies lie in porphyry basins and are cut off by the granite formation. B. B. Lawrence, the consulting engineer for the Portland Co., says that while the quantity of ore is greater in the porphyry the quality is good in the granite. The Portland has demonstrated that there is rich ore in both granite and porphyry to an indefinite depth.

The Georgetown *Courier* says that the rise on the Griffith mine is turning out $140 ore to the foot.

The Union Co., Cripple Creek, shipped 3500 pounds of high-grade ore and five tons of $40 stuff.

Victor *Record*: The Portland has been encountering some of the richest ore ever found on the property in the drifts from the sixth level. A sylvanite ore chute was opened in the lead and for many weeks yielded quantities of high-grade smelting ore.

Sixty tons of ore were sent from the Moon-Anchor last week. Another 100 tons left the property this week.

Of the last lot from the Pharmacist 2½ tons averaged 31.19 ounces; 15 tons, 4.45 ounces, and 33 tons, 1½ ounces.

A shipment from the Gold Sovereign contained ten tons of $300 ore and eight of $6.

The Lillie at Cripple Creek is outputting thirty tons per day of $60 ore.

Simmons & Mick on the Zenobia sent out sixteen tons that assay from $60 to $80.

Shipments from the Anchoria-Leland properties last week amounted to 150 tons, all smelting ore.

Anstie & Von Hemert are shipping fifty tons per week from the Mattie L.

A sale of mining property amounting to $75,000 was consummated during the week, says the Colorado Springs *Investor*, by which the Jewel claim was transferred from J. P. McCoy to the Crippon-Lawrence.

A. L. Dickerman and associates paid $85,000 into the First National Bank of Colorado Springs last week, says the *Investor*, as part of the purchase price of the Orphan Bell Co.'s properties. This makes a total of $160,000 which has been put up by the purchasing parties.

NEW MEXICO.

The Colfax M. Co. at Elizabethtown is said to have encountered a lead of ore 2 feet thick, assaying over $100 per ton.

Crawford Bros. resumed concentrating the tailings at the old Pacific mill, Silver City. They produce half a million pounds of concentrates per month.

Thirty tons of second-class ore is being hauled to the Porter mill from the Brush Heap mine, near Hillsboro, for a test preparatory to building a mill in Sawpit gulch.

The Shoshone, near Red River, is taking out good ore. The owners, Gusdorf Bros., will put in a mill in the spring.

Bruce & Wilson, doing development work on the Crown Point mine for O. P. Posey and associates in the Cochiti G. M. Co., are said to have struck a body of ore in the south drift at the 150-foot level that runs $600 in gold to the ton.

The Santa Fe *New Mexican* announces that Thomas A. Edison and an English company have closed a deal for the Ortiz grant, in South Santa Fe county. The price agreed upon is $1,500,000, payable in two years. Edison is building a plant that will handle 25,000 tons of placer dirt per day, and will make his headquarters at Santa Fe.

TEXAS.

On the lignite coal mines, three miles west of LaGrange, the vein is from 18 to 21 feet thick, and carries about 52 per cent fixed carbon and 5 per cent ash. There is a large territory underlaid by this vein. Four shafts have been sunk.

ARIZONA.

(Special Correspondence.)—At Canyon Del Oro, thirty miles north of Tucson, are the placer grounds belonging to Capt. J. D. Burgess and associates, which are being worked under lease by Messrs. Newsem and others, with water sufficient during part of the year. The gravel deposits at this point exist in banks and benches rising one above another. The work going on is testing, and results appear to warrant work on a larger scale. The future plans contemplate the building of a reservoir for water storage and putting in hydraulic works.

At Shultz, fifty miles northeast of Tucson, are in operation the Mohawk and Mammoth. The Mohawk has a double-compartment shaft 300 feet deep. The vein is reached from the 200 and 300-foot levels, connected by winzes. The underground workings are lighted by electricity and the air circulation is excellent. The ore, free-milling, is handled by a 30-stamp mill, ninety tons per day. The mill and mine are supplied with water by a steam pump and pipe line from the San Pedro river, three miles distant. The Mammoth mine, operated by the Mammoth-Collins Company, is developed by six levels from a 600-foot shaft. There are from 200 to 1200 feet of work on each level. The ledge of ore, which dips slightly, is from 6 to 40 feet wide. The vein matter is a quartzite; the company saves about 75 per cent of the values. The vein walls are granite and andesite. The ore is porous and breaks down readily. The values are said to run from $6 to $12 per ton. Some satisfactory cyanide tests have been made on this ore. The Mammoth and Mohawk are on the same vein and the ores of the two are similar. The Mammoth mill of fifty stamps is on the San Pedro river, three miles east of the mine, where the village of Mammoth has been built up. A tramway is being constructed from the mine to the mill. The latter is being overhauled and repaired. The Samaniego stage line carries daily mail from Tucson to Mammoth via Canyon Del Oro and Shultz. The U. S. Government maintains a telegraph office at Mammoth, being on a line connecting various military posts. The San Pedro, which carries considerable water at certain seasons of the year, flows into the Gila, thirty miles northwest of Mammoth.

From Mammoth sixteen miles eastward, over the pass at Table mountain, is the property of the Table Mountain Copper Co., whose fifty or sixty tents are pitched. About seventy-five men are at present employed there. Several thousand dollars have been expended by the company in making a good wagon road from the camp to a main road leading to the Southern Pacific railway at Wilcox, seventy miles distant. Machinery and supplies are brought to Table mountain by this route. This property is being developed by an open cut, the workings having the appearance of a large quarry. The face of the cut, showing a black oxide and carbonate of copper, has a vertical thickness of about 50 feet, and the surface outcroppings of the same extend 3000 feet laterally. At present the ore contains no sulphides, though no prediction can be made as to what deeper workings may result in. The ore contains silver and gold. According to tests made the copper values run from 12 to 18 per cent. On the dumps and in sight there are several thousand tons of ore which are supposed to possess good smelting value. The stone work and heavy timbers are being put in for a smelting plant. The machinery for the plant has been purchased and some of it is at Wilcox station, ready to be hauled to the camp. A part of the equipment will consist of two copper furnaces. Wm. Jenks is superintendent and E. A. Clark mine foreman. Capt. J. D. Burgess, general manager, states that the ore carries gold as high as $40 per ton. The character of the work and the position of the smelter will make it possible to handle the ore very economically.

WASCOTT.

Tucson, Ariz., Feb. 19th, '98.

Senator Tabor says he will build a smelter at Wickenburg, near Phœnix.

In Cedar valley, forty miles south of Kingman the Cedar Valley M. Co. is operating a 15-stamp mill on ore from the Arnold mine.

The Holland mine at Washington Camp, Pima county, has started up after lying idle for some time.

The efforts of the King of Arizona mine, in Yuma county, to obtain a water supply at the mine have proved futile. They contemplate putting in a tramway from the mine to the present mill-site at Mohawk, a distance of thirty miles. A 10-stamp mill will be put in and a cyanide plant added to work the tailings.

There are twenty-five men at work on the Copper Prince group, out from Tucson. The mines are producing ore of good grade.

The tailings at Smith's mills, says the Phœnix *Republican*, which M. McLeisch has been cyaniding for three years, produced from $5 to $8 a ton.

From thirty-five to forty tons of tailings per day are treated at the Little Jessie mine, near Prescott, by the cyanide process, with a result of from $8 to $10 per ton gold. Some of the tailings yield as high as $18 per ton gold.

Work on the Loudon-Gallen mine in the Whetstones, in Cochise county, is being pushed.

In the Mammoth mine, near Tucson, it is said that an ore body of good value has been struck on the 600-foot level.

MEXICO.

The Grand Central M. Co. will run a pipe line from Las Amarillas to San Jose de Pimas.

A Press telegram states that O. Jensen of St. Louis arrived in Casas Grande, State of Chihuahua, with $800 in gold dust, which he cleaned up in three months from a placer located in the Sierra Madre mountains. Jensen refuses to divulge the location of the placer grounds. He says he will clean up $10,000 this year.

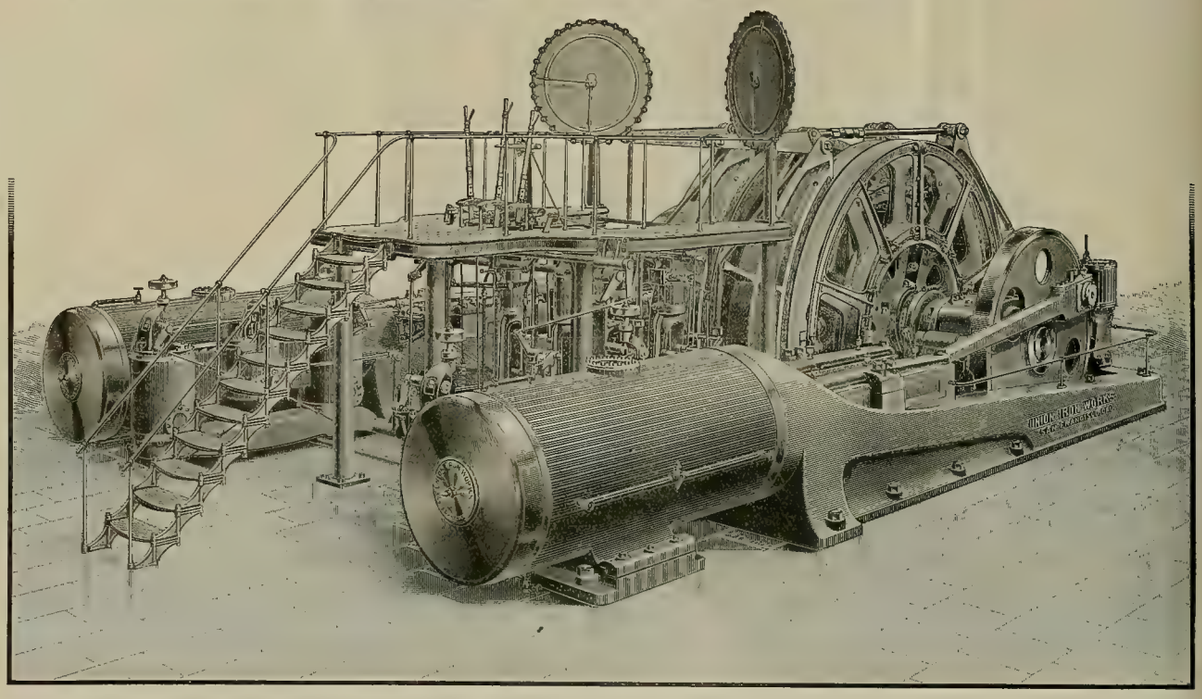
The Corralitos Co. is erecting on the line of the R. G. S. M. & P. road, two miles from Juarez, a concentrating plant of a daily capacity of 200 tons. In connection with the concentrator, they are putting up sampling works able to sample 500 tons of ore per day. The company will also engage in a general ore purchasing and sampling business. In addition to the concentrating and sampling plant, they will at once build two 100-ton smelting furnaces—one for silver and lead and the other for copper. The company is pushing development work on all of the Corralitos mining properties and expects to begin shipping ores to the concentrator next month. To begin with, the concentrating and sampling plant will employ a force of fifteen Americans and about fifty Mexicans. Briton W. Davis is Gen. Mgr.

In the Creston mine at Minas Prietas a new vein of good ore was cut on the eighth level. Drifts are being run on the vein which show it to be continuous.

The combination shaft on the Grand Central mine at La Colorado is down 700 feet and ore is being hoisted. On the seventh level a body of good ore has been uncovered extending the width of the shaft, 21 feet.

THE recent ruling of the Commissioner of the General Land Office, which requires that $500 worth of work be done for each location before a patent can be issued, applies only to lode locations. In 1881 the Supreme Court of the United States decided a case taken up from Colorado that settled the question so far as it relates to placer locations. The case was entitled St. Louis Co. vs. Kemp. The Supreme Court held that "a miner's claim might consist of several locations, that several contiguous locations being purchased by one man became his claim." The court held that several locations, which touch, constitute one claim, and may be patented under one affidavit and upon one set of $500 improvements.

UNION IRON WORKS,

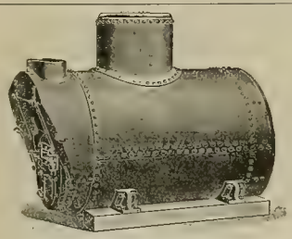


222 Market Street, San Francisco, Cal.

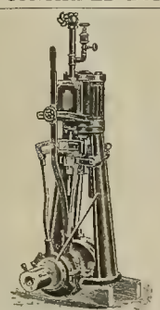
30 in. x 72 in. Direct Acting Hoisting Engine

BUILT FOR THE

Anaconda Copper Mining Company



OF MONTANA.



Embodying all that experience and practical working have demonstrated as valuable in this class of machinery.

The brakes, clutches and reversing gear are arranged to be operated by compressed air or steam, by means of auxiliary cylinders which are under full control of the engineer, stationed upon the elevated platform shown, insuring the most rapid work with absolute safety. Shaft hollow forged steel of ample strength and stiffness to withstand any strains; reciprocating parts of steel and are as light as consistent with the duty required; cylinders of the "overhung" type, weight being taken by a guide saddle, which admits of free longitudinal movement, due to expansion, causing no strain on bed plate or foundations; cylinders steam-jacketed, fitted with valves provided with Corliss releasing gear and hand cut-off, enabling the engines to be run economically with reference to the work to be performed; bed plates modification of the Porter Allen type, heavy and substantial, with large foundation base and anchor bolts. A duplicate of this engine has also been furnished the Homestake Mining Company of Dakota.

PLACER MINING

WITH THE Improved Electrical Shovel or Dredge and Amalgamator,

—MANUFACTURED BY—

THE BENNETT Amalgamator Manufacturing Co.,

DENVER, COLO., U. S. A.

—WORKS:—

Cor. 36th and Wazee Streets, DENVER, COLO.

Eastern and Foreign Office, Johnstone Building, No. 30 Broad Street, New York, N. Y.
SAMUEL DEXTER HAYWARD, Manager.
Cable Address, "Bennetts," Denver or New York.
Sole Manufacturers (except for the State of Colorado) under all the Patents Covering the "Bennett Amalgamator" Plants.

These plants, being the outcome of many years of evolutionary experiment in the field of their actual operation, are constructed in the most thoroughly substantial and workmanlike manner, of the best material the market affords, with a view to their maximum efficiency, strength and durability; the operating portions almost exclusively of steel, to gauge, and therefore interchangeable, and having been thoroughly tested as to all points, under widely varying conditions, are fully warranted to perform as indicated in the following table:

FOR "GULCH," "BAR" AND "HILL" DIGGINGS.

Number.	Capacity in cubic yards of gravel per 24-hour day.	Total operating cost in cents per cubic yard of gravel.	Miners' inches water required where water is scarce or abundant.	Approximate total weight inclusive of power plants.	
1...	2500	2 to 4	25 to 150	150 tons	Single operating plant
2...	5000	2 to 3	50 to 300	200 tons	Duplex operating plant
3...	7500	2 to 2½	75 to 450	300 tons	Triplex operating plant

SWAMP AND RIVER-BED PLANTS.

Number.	Capacity in cubic yards of gravel per 24-hour day.	Total operating cost in cents per cubic yard of gravel.	Miners' inches water required where water is scarce or abundant.	Approximate total weight inclusive of power plants.	
4...	2500	2 to 4	Barge	250 tons	Single amalgamator
5...	5000	2 to 3	Barge	325 tons	Duplex amalgamator

In general terms it may be said these plants consist of the electrically operated dredge and amalgamator, mounted either on steel barges for swamp or river-bed mining, or steel-bodied cars for "gulch," "bar" and "hill diggings," together with the necessary power plants for their operation. Several operating plants, either in close proximity or scattered over a large district, may be operated from a single power station, which may be situated at any convenient point within a radius of a few miles, at railroad depot or where water power can be utilized. The river plants, complete in themselves (each barge containing its own power), are made single or duplex: any suitable number of either can be operated on a river, each independently working its allotted section from surface to bedrock, and rim-rock to rim-rock. All these plants are built with a view to easy transportation, in "knock-down" shape over ordinary mountain roads, and, on special order, the size and weight of separate parts may be still further reduced. In the foregoing table the figure representing the smaller quantity of water required applies to cases where, for any reason, it is desirable or necessary to use the water over and over. The water required may be taken from below the placer, thus obviating the necessity of long ditches, etc. Since these plants neatly pile their debris on the cleaned-up bedrock of the ground worked, they may be said to create their own dump, and hence are enabled to successfully operate on flat ground, or where ordinary dumping facilities are lacking. This peculiarity also renders them independent of "debris laws." The wonderful perfection with which these plants extract the finest, microscopic particles, such as are held in suspension in water, or, when dry, ascend in a gentle current of air, constituting in bulk a perfectly impalpable powder (send for samples), renders them particularly valuable and indispensable in cases where, owing to the fineness of the golden particles, very rich mines are unavailable for profitable working by the hydraulic or sluice processes.

All plants are furnished with duplicate parts and wearing pieces to cover at least two years' constant use, while the life of the plant is conservatively placed at twenty-five years' active service. For further information address as above.

In San Juan County, Colorado.

Very different from the low altitude and warm valley where is located the Saginaw property in Arizona, depicted on the front page, is the San Juan country in southwest Colorado, of which Silverton is the commercial center. Its high altitude and snow-crested mountains do not prevent 800 miners working nearly every day in the year. The mineral output of the county for '97 was $2,500,000. Of the Silver Lake group, the Colorado State mine inspector says: "They are the most thoroughly equipped mines in the State." As in other parts of Colorado, so in San Juan county. When the miners found silver discredited, they turned their attention to gold, and gold is one of San Juan's present productions, though San Juan was and can be, if needful, among the first of the greatest silver-producing sections of the State. During '97 the Silverton smelter treated 13,380 tons ore, yielding 2431 ozs. gold, 186,173 ozs. silver and 920,800 lbs copper.

The handsome engraving of Silverton is from the office of the *Standard*, Silverton's leading mining journal, and is a good example of Colorado newspaper enterprise.

A YEARLY saving of about $709 will be realized by the Baltimore and Ohio Southwestern Railway by the use of electric motors for operating turntables. Experiments were made with one on the 60-foot turntable at Chillicothe, the current being purchased from the power plant, and costing on an average less than one-half a cent for each time the table was turned. When the same table was operated by hand it cost twelve cents for each engine. Besides, it generally takes four men to turn a locomotive, and while they are doing this their regular work is abandoned. The economy demonstrated by the experiment was no small item in the aggregate results.

Gases Met With in Mines.*

By WM. RALSTON.

Carbonic acid, or carbonic anhydrate, or CO^2, is composed of one atom of carbon and two atoms of oxygen.

Its specific gravity, 1.52, is heavier than air, therefore it is found on the floor of mines before it is mixed with the air. It is called "choke damp," "black damp," or "stythe" by the miner. It is colorless, invisible, and has a sharp odor and taste. It is composed of 72.7 per cent of oxygen and 27.3 per cent of carbon by weight. A candle will go out in air containing 10 per cent of it, air containing 3 or 4 per cent is unfit for respiration, air containing 6 per cent is dangerous to breathe, and 8 or 10 per cent is fatal to life. Some coal seams are subject to blowers of black damp (CO^2) very much in the same way as others are subject to blowers of fire damp. Blowers are usually detected as a cool air on the back of the hand. This black damp (CO^2) is also found in wells and should be tested before going down. If present in dangerous quantity, a lamp flame is put out by it. It may be removed in various ways. By quicklime in the process of slackening which absorbs the gas, by letting water fall down, and by drawing up the bucket several times.

Carbonic oxide (CO), one atom of carbon and one atom of oxygen; its specific gravity is .975; it is a little lighter than air. Out of 100 parts by weight there are 56.7 of oxygen and 43.3 of carbon.

It is called "white damp" by the miner, is colorless, tasteless, and poisonous, yet it has a slight peculiar odor. It does not in the ordinary sense support combustion, yet a candle or lamp will burn in it with mixture of air which at once destroys life. It is more poisonous than black damp (CO^2). Air containing 1 per cent of it is at once fatal to warm-blooded animals. Its most striking property is that it is itself combustible and burns with a beautiful blue flame. White damp (CO) is poison and enters the blood through the lungs, and its presence can be detected only after the death of the subject. The report of the French fire-damp commission gave its temperature of ignition at 1202° F.

Sulphureted hydrogen, or hydrogen sulphide (H^2S), two atoms of hydrogen and one atom of sulphur; specific gravity 1.17; is a little heavier than air. It is a poisonous and colorless gas. It does not support combustion or respiration, but is itself combustible and burns with a blue flame. Water dissolves from 2½ to 3 times its volume of the gas, and acquires its offensive taste and odor. Consequently it may be carried in the mine in a state of solution by the water and afterward liberated. Hydrogen sulphide (H^2S) is a gas injurious in the mines in various ways. It affects the iron rails, pumps, etc., and is found in mines as a decomposition of pyrites or of some animal substance containing sulphur. It is also a result of exploding gunpowder. The exact proportion of this gas that is fatal to life is not known; some authorities give it at ½ to 4 per cent. A light continues to burn in it, and its presence can be detected only by its odor.

Proto-carbureted hydrogen, fire damp (chemical symbol, CH^4) is an inflammable gas met with in mines. Its specific gravity is .56, and it is considerably lighter than air, and owing to this fact it has a tendency to rest against the roof of the mines and in cavities, unless disturbed by an air current. It is a colorless, odorless gas, scarcely soluble in water, and does not support combustion or respiration. It is not a poisonous gas, but if breathed in a pure state it causes death because it does not support respiration. It issues as a product of decomposition from the seams of the coal and when mingled with air in certain proportions it forms a mixture which has caused many destructive explosions. When fire damp (CH^4) forms one part to thirty of air and gas mixture its presence can be detected by the cap from a safety lamp. The maximum explosive mixture of fire damp and air is 9.6 air to 1 of fire damp. The French fire-damp commission gives its temperature of ignition at 1436° F.

*Paper read at the meeting of Ohio Institute of Mining Engineers, Jan. 21, 1898.

SILVERTON, SAN

The exact composition of after damp will depend on the composition of the explosive mixture, the most common being $1CO^2+7N+2H^2O$.

The origin of gas in coal is a matter of uncertainty. The coal being formed by vegetable matter, it is quite possible that during the process of decomposition new strata accumulated to such an extent as to cause considerable pressure, and when this newly deposited matter was of a porous nature the gas given off would escape through the strata to the surface. But when the cover over the vegetable matter was impenetrable the gas was retained at the increasing pressure as decomposition proceeded and the coal seams fully matured.

SOME comparative tests have recently been made at Chester, Pa., with a view to determining the relative efficiencies of direct connection and belt driving. A tandem-compound condensing engine was direct-connected to a 400-kilowatt generator running at 100 revolutions per minute, and in another test two condensing engines, at eighty revolutions, were each belted to a 225-kilowatt generator. The result of the test showed a saving in coal of 22.7 per cent in favor of the direct-connected engine. The difference in the interest on the cost of installation, however, would be comparatively small, and would reduce this figure only about 7.5 per cent. The brush holders are so arranged that by one hand wheel they must be simultaneously shifted, or by another all raised at one time from the face of the commutator.

As Seen by a Colorado Man.

Ex-Mayor Platt Rogers returned on Wednesday evening from a three weeks' trip to California, enthusiastic over the possibilities of gold production in that State.

"I see by one of the papers," said he, "that a man from Grass Valley, Cal., is here to look over some mines at Jimtown. That struck me rather peculiarly, as I had just left this country to go to Grass Valley to look at mines. That is to say, not exactly at Grass Valley, but at the mining districts in Tuolumne county, but the simile holds. It is the custom for man to look to a distance for relief, but in this instance I believe that my instincts are right. I think that California is going to astound the world with her development of gold. I believe more gold will be produced in that State than was ever dreamed of. At the same time, California is looking to Colorado for development. They say, 'If we had a few of your enterprising, energetic workers out here, we would make a marvelous showing.'

"The trouble with California is that she is sluggish. The great multi-millionaires, the men who made California what it is, like Fair and Mills and the rest of them, have moved away, while the other 49ers have simply settled down to enjoy the rest of their lives in comfort.

"California is not in the best of shape at present, owing, for one thing, to the hold that the Southern Pacific has on the State, and I would not advise you to start in business of any kind out there except in mining. In the southern part of the State it is different, for there it is Eastern capital that is at work, and Los Angeles is the best town on the coast at present—better even than San Francisco, although it should not be, for San Francisco is magnificently located.

"It is in the gold of that country, however, that I pin my faith. The mother lode, or gold belt, or whatever you want to call it, is known to exist from one end of the State to the other, and it is a known fact that gold can be reached at any point along it by sinking far enough. While there is a similar theory in Colorado, it is theory and nothing more, while in California it is an undisputed fact. This mother lode is practically covered with locations from one end to the other. They might be said to extend the length of the State in an unbroken line.

"There is not a new camp in the State. Every one of these new discoveries have been made in the old camps, nearly all of them being in abandoned claims—claims that were worked between 1849 and 1859. I secured a number of papers printed during the jubilee there and they gave accounts of conditions at that time, when flour was $50 a sack and other things in proportion. It did not pay to work the mines, for they could not get enough out of them to pay for the necessities of life at those prices, but at present prices they are worked with great profit.

"It was the same way in Colorado. I know that it doesn't sound well to say it here, but the demonetization of silver was the greatest godsend that Colorado ever had. Gilpin county was asleep for years, while Leadville was booming. It was just what Leadville is to-day, but the demonetization of silver brought about the development of gold properties and to-day Colorado leads in the production of gold with over $23,000,000, whereas before the repeal of the silver bill it was far below $10,000,000.

"One of the great features of the California gold belt is that the mineral is all free gold. I know properties in Boulder county—good properties—that have been abandoned on account of refractory ores. As long as the ore was easily reduced these mines were worked, but when the live ore was struck they were abandoned, owing to the difficulty in reducing them.

"In California it is all different. The gold is free gold, the next thing to placer gold. There all the miner has to do is to erect his own stamps, run his ore through them and take the bullion out of the plates. He has no milling fees to pay, no smelting fees, no combination of smelters to fight, no costly reduction or concentration processes to go through, no exorbitant freight charges, and is in every way owner and master of his own property.

"Colorado men who are in the field there—and there are plenty of them—say that California is the great gold State, and they are preparing to take up properties. One of them prepared a map for me from the government surveys, showing the unbroken line of claims from one end of the 700-mile State to the other."—Denver Post.

THE BEST BOOKS

Are always the **CHEAPEST.** All the latest and best works on **Mining, Metallurgical, Electrical and kindred subjects** can always be obtained through the office of the MINING AND SCIENTIFIC PRESS Below will be found a list of standard books in their various lines. If you do not find what you want in it, send for catalogue and price list of **Standard Mining Works and Scientific Publications.**

MINING AND SCIENTIFIC PRESS,

330 Market Street.....San Francisco, Cal.

Assaying.—Part I—Gold and Silver Ores.

Third edition; Just Out. Rewritten and Improved by the Author, C. H. Aaron. Embraces 180 12-mo pages, with illustrations; well bound in cloth; 1896. Price, postpaid.....$1 00

Assaying.—Parts II & III—Gold and Silver Bullion, Lead, Copper, Tin, Etc.

Latest edition. Contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter. Price, postpaid.....$1 75

Prospector's Field Book and Guide.

By H. S. Osborn.....$1 50

Roasting of Gold and Silver Ores and the Extraction of their Respective Metals Without Quicksilver.

Second edition. By Guido Kustel, M. E. Contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. Price, postpaid.....$3 00

Modern Copper Smelting.

By Edward Dyer Peters, Jr. Eighth edition. Rewritten and enlarged. Profusely illustrated....$5 00

Practical Treatise on Hydraulic Mining.

By Aug. J. Bowie, Jr. On the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting tunnels and sluices; tailings and dump; duty of miners' inch, etc. Price, postpaid.....$5 00

Practical Hydraulics.

A book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers and Irrigators. By P. M. Randall. Contains useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulæ, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules and tables are prepared. Is specially applicable to the Pacific Coast. Price, postpaid, $2

The Explorer's and Assayers' Companion.

A third edition of selected portions of the "Explorer's, Miner's and Metallurgist's Companion." By J. S. Phillips, M. E. A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying and Metallurgy. Price, postpaid.....$6 00

The Metallurgy of Gold.

By M. Eissler. Profusely illustrated.....$5 00

Cyanide Processes for Gold and Silver Ores.

By E. B. Wilson, E. M. 12mo., cloth.....$1 50

Quartz Operator's Handbook.

By P. M. Randall.....$2 00

Skeleton Mining Report.

Of great practical value to miners and mine owners in making a comprehensive report on mining properties. Useful and convenient to mining engineers as a field notebook. Price, postpaid....50 cts.

Stamp Milling of Gold Ores.

By T. A. Rickard, M. E. An actual record of milling practice in this and other countries. Deals with the erection and management of mills, and contains many helpful suggestions to those interested in the extraction of gold from its ores. Well illustrated. Cloth. Price, postpaid.....$2 50

Miners' Pocketbook.

A reference book for miners, mine surveyors, geologists, mineralogists, millmen, assayers and metallurgists. By C. G. Warnford Lock. 472 pages, illustrated, flexible leather.....$5 00

Manual of Mining.

For the use of Mining Engineers and Technical Schools. Treating of Preparatory and Exploratory Work, Methods of Mining, Hoisting Machinery, Pumping, Ventilation Shafts, Tunnels, Blasting, Timbering, etc., etc. By Prof. Magnus C. Ihlseng, E. M., Ph. D. Third, revised and enlarged, edition. 548 pages, 8vo., cloth.....$4 00

Manufactured Only in California.

It infringes no patents, any statements to the contrary are false and made to mislead intending purchasers.

WHITE, ROGERS & CO.,
Constructing Engineers and Millwrights,
Offices: 306 PINE STREET, SAN FRANCISCO, CAL.
Sole Pacific Coast Agents and Builders of the Celebrated
WILFLEY CONCENTRATOR.

WILFLEY CONCENTRATOR.

PRICE $450 F. O. B. SAN FRANCISCO.

One of these machines will take the place of two or three belt concentrators of any style and do very much better work.

SEND FOR CIRCULARS.

Some Practical Reasons Why the Wilfley Concentrator Should Be Used in Gold Mills:

1. It will successfully handle three or four times more material than any belt Concentrator made, without exception.
2. It will save more sulphurets in proportion while so doing, and catch any float gold, amalgam or quicksilver which may escape from mortars or plates.
3. It will make cleaner and much more valuable concentrates, thus saving useless expense for transporting valueless material, as also extra cost for treatment.
4. It requires little or no attention when once adjusted and no expert is required to either adjust or run the machine.
5. It will save much expense in power and room, and the first cost of a mill requiring concentrators.
6. It has no expensive belts to crack and wear out nor complicated machinery to keep in repair.
7. It is the only sensible plan of concentration, as any kind of material can be worked, which is not true of any style of belt machine.

PATENTS

DEWEY, STRONG & CO'S PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & CO.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press.* We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

THE GUTTA PERCHA AND RUBBER M'F'G CO.

30 and 32 FREMONT ST., SAN FRANCISCO.

Spadone's Concentrator Belts. Patented.

The "SPADONE" Curved Edge Concentrator Belt is attracting much attention among mining men, its merits appealing to the millman o practical experience.

Illustration (Fig. 1.) shows a cross-section, and (Fig. 2.) shows the edge flanging outwardly as it passes over the pulley. This relieves the strain from the top and bottom of the edge by directing the strain automatically to the inside face surface of the edges. Heretofore all belts have been so constructed that when they pass over the pulleys or rolls, a direct strain comes upon the top or at the base of the edges, causing the edges to break away from the body of the belts in a very short time. *We avoid this Mechanical Defect by our Spadone Curved Edge.* Belts made to fit any machine—4, 5 and 6 feet wide. Prices and samples on application.

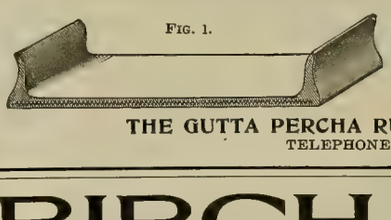

FIG. 1.

MINE BELL SIGNALS.

Adopted, Used and in Force in Accordance with State Law.

FOR THE CONVENIENCE OF OUR READERS IN THE MINING COUNTIES WE PRINT IN legal size, 12x36 inches the Mine Bell Signals and Rules provided for in the Voorhies Act, passed by the State Legislature and approved March 8, 1893. The law is entitled "An Act to Establish a Uniform System of Mine Bell Signals to Be Used in All Mines Operated in the State of California, for the Protection of Miners." We furnish these Signals and rules, printed on cloth so as to withstand dampness, for 50 cents a copy. MINING AND SCIENTIFIC PRESS, 330 Market St., San Francisco

Market Reports.

The Markets.

SAN FRANCISCO, Feb. 24, 1898.

The demand by outfitters for Alaska and the Northwest Territory fills the gap between seasons in our markets, for January and February have always been dull months. It is not outfitters alone that are calling for supplies, for good-sized orders are being filled for dealers at the leading distributing points in Alaska and British Columbia. It is worthy of mention that Seattle and Tacoma, on Puget sound, and Portland and Astoria in Oregon are buying quite heavy. The volume of goods going to them is said to be double that of a year ago. Rains which began to fall last night are said to be general in this State. They are not only heavy, but soaking, and if they continue for the next twenty-four or thirty-six hours are worth hundreds of thousands of dollars to the State at large. Their effect is seen already in our city, for business men in general look more cheerful, and well they may, for it means dollars to them and also a large increase in business.

The local money market is practically unchanged. All the money wanted can be had on unquestioned security, but where there is any doubt it is hard to get accommodations from bank. The funds in bank are said to be increasing with a light call for any purpose. The disbursements by outfitters for Alaska and the Northwest Territory aggregate several hundred thousand dollars a week, with a steady increase expected for the next four or five weeks. The receipts of bullion from mines in this and adjoining States are increasing, now that cold weather has given place to higher temperature. It is stated that the outlook is promising for more capital going into mines this year than in 1897. Several sales have been made, while negotiations are pending for others. The largest consideration, so far, is $400,000 for a deep mine on the mother lode.

New York Silver Prices.

NEW YORK, Feb. 24.—Following are the closing prices for the week:

	Silver in London.	Silver in N. Y.
Friday	25 13-16	55¾
Saturday	25 13-16	55¾
Monday	25¾	55¾
Tuesday		
Wednesday	25⅝	55⅛
Thursday	25⅝	55⅛

	Copper.	Lead.	Iron.	Tin.

Wed.	11 30 @11 50	3 80	10 00@12 00	14 05
Thur.	11 30 @11 50	3 80	10 00@12 00	14 05

The local bullion, money and exchange quotations current are as follows:

Commercial Loans, % per annum	6
Commercial Loans, prime	5
Call Loans gilt edged	4@4½
Call Loans mixed securities	5@6
Mortgages prime, taxes paid by lender	6@8
New York Sight Draft	17½c Prem
New York Telegraphic Transfer	20c Prem
London Bankers' 60 days	$4.82¾
London Merchants	$4.81½
London Sight Bankers	$4.85½
Refined Silver, per oz., 1000 fine	55½
Mexican Dollars nominal	46@—

SILVER.—The market has sold to lower prices, with the closing at New York and abroad easy. It is hard to locate any particular cause for the decline, as it seems to be based on several. The political unrest abroad and the strained relations between the United States and Spain undoubtedly have something to do with it, as also the placing of Council bills for India. The placing of an $80,000,000 loan by China may possibly call for some silver, and if so it will have a favorable influence when it sets in.

MEXICAN DOLLARS.—The market is quiet, with a light inquiry for China.

COPPER—The market has moved to still higher figures under a continuance of the heavy export movement and increasing home consumption. The stocks in this country decreased in January nearly 5000 tons, notwithstanding free deliveries by mines. The general tenor of advices is to the effect that the spring months will see a still further increase in the consumptive demand at home and abroad, which will cause a further strengthening in prices at the East.

Our market is quoted as follows:

Ingot casting, jobbing	13 @—
Ingot " wholesale	12½@—
Sheet copper	16½@—
Bolt ¼ and 5-16, 20c; ⅜ and larger,	16½

TIN.—The market has held to fairly steady prices for ingot under fair offerings at the East for shipments from primary markets. The decline in silver is favorable for buyers of Straits. Tinplate is easy, with some cutting. There is a good movement, as the canning season on this coast is opening.

The market is quoted in jobbing lots as follows:

Pig	4 75 @ 5 00
Sheet	@ 6 50
Pipe	5 30 @ 5 80

LEAD.—There is a steady tone to our market, but at the East it looks as if they are not so strong. If advices are not misleading, there ought to be quite an increase in the consumptive demand in this country, and, if so, stiffer prices are not at all unlikely to rule.

Pig, per lb., jobbing	—@ 15
Plate, I C coke, heavy, per box	$4 10@4 25
" " " light, "	4 00@—

SHOT.—Our market is quoted as follows:

Drop, sizes smaller than B, per bag of 25 lbs	$1 35
Drop, B and larger sizes, " "	1 60
Buck, Balls and Chilled, do. " "	1 60

QUICKSILVER.—New York mail advices report a strong market, but ours is unchanged.

Our market is quoted at $39 for domestic consumption and $35@36 for export to the west coast of Mexico.

IRON.—Our market is practically unchanged. Imports the past week aggregate 957 tons from Baltimore. The East reports continued ease in the markets notwithstanding the heavy consumption at home and large export movements.

AMERICAN.

	To Arrive.	Spot.
Sloss	$20 00	$22 00
Thomas	21 00	22 00
Salisbury	29 00	31 50

ENGLISH.

Barrow	$21 00	$23 00
Gartsherrie	21 50	23 00

COAL.—Lower temperature increasing receipts by mail from east of the mountains and also from the sound and foreign ports have caused a decline in Seattle and Coos Bay. The decision of the courts against the coal combine has something to do with the weakening, for dealers can now buy of any one and any kind of coal.

Receipts of coal for the week ending with Tuesday were as follows in tons: Departure Bay 5756; Puget sound 6700; Coquille river 285; Sydney 2439; Nanaimo 6459; Cardiff 2488; Baltimore 3580; Newcastle, N. S. W., 2295. Total 29,513.

Egg, hard	10 50
West Hartley	7 25

COKE.—The market is steady, with a good demand ruling. Imports the past week aggregated 1710 tons from Newcastle, England, and 185,000 kilos from Antwerp.

Gas Companies'	— —
English, to load	— — @ — —
" spot, in bulk	11 00 @ — —
" in sacks	12 00 @ — —
Cumberland	10 00 @ — —

BORAX.—The market is firm, with a strong demand from the East. The market is quoted as follows:

Refined, in carload lots, in barrels	7
Refined, in carload lots in sacks	6¾
Powdered, in car lots	7
Concentrated, "	6½

POWDER.—The market is steady at current quotations. The market is quoted as follows for Hercules: No. 1, from 11¾c to 17½c, according to strength and quantity; No. 2, from 9c to 11c, according to strength and quantity.

PLATINUM.—The market is unchanged. Our market is quoted in a jobbing way at $16 per ounce and for scrap $11 per ounce.

ZINC.—The market is steady. Our market is quoted at 10@15c, according to thickness.

ALUMINUM.—The market is firm. We quote in jobbing lots at 45@50c per pound for ingots.

Chemicals.

The demand is quiet but it is expected to improve soon, when it is expected that some changes will be made in quotations, as the stocks in jobbers' hands are small. New York mail advices report quiet markets at unchanged quotations.

CYANIDE OF POTASSIUM.—The market is steady. Our market is quoted for chem cal pure, 32 cents per pound for jobbing lots, and 29 cents for carloads.

SULPHURIC ACID.—The market is firm. We quote in a jobbing way at 1½c per lb. for 66%.

ACETIC ACID.—The market is firm at 6 to 12c per pound from store for carboys, according to make.

NITRIC ACID.—Our market is reported steady from store at 6½@7c per pound in carboys.

BONEASH.—There is a good demand for export. Our market is quoted in a jobbing way as follows: Extra, 4c a pound; No. 1, 3½c; No. 2, 2½c.

BLUE VITRIOL.—Our market is steady. We quote in a jobbing way at 4c per pound.

SPELTER—The market is steady. We quote our market in a jobbing way at 5c per pound.

BISMUTH.—The market is firm. Our market is quoted in a jobbing way at $1.40 a pound.

SODA ASH, 58% (Le Blanc process).—The market is steady at $1.55 per 100 lbs. in a jobbing way.

CAUSTIC SODA, 60%.—The market is steady at 3c per pound in a jobbing way.

HYPOSULPHATE OF SODA.—The market is quiet at 2½c a pound from stores.

NITRATE OF SODA.—The market is about the same as it has been for a month past. Our market is quoted from store at 4c for 95%.

PHOSPHORUS.—The market is steady. We quote in a jobbing way at 70 to 75 cents per pound.

Mining Share Market.

SAN FRANCICO, Feb. 24, 1898.

The market has dragged throughout the week, with quite an easing off towards the close. The actions of the market, more than all else, emphasize the belief with the shrewder and more successful operators that the moneyed pool is back of the manipulation, which is being done by one person in its interest. By hanging assessments over the market, reporting failures in the work going on in the mines, and not bidding for shares, but quietly taking all thrown out by disgusted holders, the pool can concentrate the more desirable, which it is doing. When reports were current of an ore strike in February the MINING AND SCIENTIFIC PRESS asserted there would not be any, or at least not made public, and it now looks as if March and perhaps part of April will pass before ore is reported and the market made active at advancing prices. This opinion is based on the work in mines which is of a kill-time character, so as not to make a development until after the next line of assessments has been collected. But the officials of the company are powerless to prevent it. The departure of J. L. Flood for Japan on a two months' trip is taken advantage of by bears to sell shares, which are being taken in by the pool of which Mr. Flood is said to be a member, but does not control. The heavy disbursements in this city by persons going to Alaska and the Northwest Territory are causing idle money to accumulate. These purchases also make a more hopeful and speculative feeling, which is further strengthened by reports of good, soaking rains throughout the State. These rains allay all fears regarding crops. That they will be followed by spring rains is not doubted in the least. With good crops, mining booming, all industries forging ahead, business active and money plentiful, the desire to speculate will grow. This, no doubt, is the leading reason why the pool is freezing outsiders out of their holdings and concentrating shares for a big move later on. The growing desire to speculate is not confined to this coast, for it extends to the East, where, if a good opportunity is given, operators on the different exchanges would take hold with spirit and put large sums of money into the game.

The news from the Comstock mines is practically unchanged, so far as official letters report work in the different mines. With a postponement of any move in the share market so as to better concentrate it, it is not to be expected that any favorable news will be allowed from official sources, even if there is any to report. The slow progress that is being made, and also changing of some of the work, so as to take more time, is not being done in all the mines, but it is in some, say reports from Virginia City. In Utah they are running a northwest drift. Work in the north drift has been stopped. The official letter from Sierra Nevada reports they are raising for connection between the Riley tunnel and surface for ventilation. This work we reported two weeks ago. They have stopped work in west crossdrift No. 5 on the 900-foot level and resumed work on the north lateral drift. In Union work the past week has been confined largely to repairing and retimbering. From Mexican there is nothing new reported, the work still being to the east on the 1000-foot level. The work in Ophir is reported to the west on both the Central tunnel and 1000-foot levels. No change is reported in the material encountered. The work in Con. Virginia is on and about levels 1550, 1650 and 1750. So far as we can learn, the contemplated new work on the 1650-foot has not been started. The work in this mine shows considerable activity, with some ore raised last week, as it is pushed forward. The joint work of Best & Belcher and Gould & Curry is to the east on the 800-foot level. In Choliar they are running west from the upraise from the 100-foot level. They are still putting in two sets of timber in the 1100-foot incline. Joint work by Potosi and Bullion is drifting from the Potosi tunnel level and repairing the old Crœsus shaft.

In Alpha they are engaged in blocking out ground on and about the 500-foot level and incidentally to kill time by procrastinating in more important work. The work by Challenge and Confidence is jointly with Con. Imperial in running the long west crossdrift. The flow of water has about subsided. The material encountered shows an improvement. In Yellow Jacket they expect to start some time in next month work on the 1000-foot level. From Crown Point, Belcher and Sego Belcher nothing new comes to hand. It looks as if in the first two favorable news ought to be had within the next sixty days, unless its work is stopped or turned aside. In Overman they are raising a few tons of ore while doing exploiting work. In Caledonia it is stated that preparations have been completed for renewing active exploiting work on the level we reported last week. It is stated that ore is known to exist on that, but whether it is the intention of striking it is one of the Comstock problems which time alone can solve. In Justice they are raising ore which is being milled. Work in Alta is progressing fairly well. They are raising a few tons of ore each week which assays over $55 to the ton.

From the Brunswick lode there is nothing new to report since our last week's review. The Occidental management are quite hopeful they are developing a valuable mine. So far the work shows quite an extent of ore which will pay to extract and mill. Work on the 550-foot, 650-foot and 750-foot levels, and also in the winze sunk below the latter level, shows that the ore is from 8 to 20 feet wide, with an average assay value of $20 to the ton. This will pay to mill. In Potosi work is confined to the 500-foot and 600-foot levels, with usual prospecting and repair work reported. The joint shaft is down over 1020 feet on an incline. They have stoped west crossdrift on the 200-foot Choliar level. On the 300-foot level they are stoping, with no change to report. In Savage the work is the same as heretofore reported. The joint work of Gould & Curry, Best & Belcher and Con Virginia is going west, and also south on the 600-foot level. They are also sinking the shaft, which is down over 1000 feet.

The following illustrates the changes of the week:

MINES.	Feb. 17.	Feb. 24.

THE HEDGE GOLD EXTRACTORS.

SAN FRANCISCO, CAL., Feb. 12, 1898.

J. W. Wolfskill, Los Angeles, Cal.

DEAR SIR:—While passing a few days at the Miners' Golden Jubilee Fair in this city I saw an exhibit of the Hedge Gold Extractors, which, in my judgment, are the best and most perfect machines for saving fine gold that I have ever examined. They are built in two styles, one a placer machine and one a quartz mill machine, and are manufactured in different sizes. The small machine is for placer work, with pump attached which works the water over and over. By this means it requires very little water to operate. The tables are set on ball bearings and run very lightly. Any size can be run by hand power. The light machine weighs about 250 lbs; built almost entirely of metal, which can be knocked down and packed in the water tanks and screen tables; can be set up in a short time, and could be packed on mule back. When packed it is in three packages: large package 24x30 inches, 6 inches deep. These machines are manufactured by the Pacific Mining Machinery Co., 127 First St., S. F. I have examined and made comparison with all other machines on exhibit in this fair, and am fully of the opinion that this Hedge machine excels all, and that for gold-saving devices for districts where but little water can be had, or transportation difficulties exist, nothing thus far has been patented to equal it. If you visit the city, it may be of value to you and other friends in your section to see and examine it. Very truly yours, A. B CONRAD.

TEN WEEKS FOR TEN CENTS!

Strange as it may seem, that big family paper, the *Illustrated Weekly Sentinel*, of Denver, Colorado, (founded 1890) will be sent ten weeks on trial for 10c.; clubs of six, 50c.; 12 for $1. Special offer solely to introduce the paper. Gold rings set with Rocky mountain gems are given free as premiums. Latest mining news and illustrations of grand scenery each week, also true stories of love and adventure. Address as above and mention PRESS. Write today; postage stamps taken.

Working Capital for Mines.

PACIFIC EXPLORATION COMPANY

Will form companies and find capital to develop mines on shares or commission. Miners who have a good prospect should write the manager of this company for particulars. Address W. E. HOLBROOK, Manager, 23-30 Chronicle Building, S. F.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from William N. Lamb, in the Croff Mine, near Oleta, Amador Co., to deposit tailings behind the dam of the Cambridge Mine, in Dry Creek; from B. F. Steese and O. Woehler, in the Long Ravine Mine, near Spenceville, Nevada Co., to deposit tailings in Long Ravine; and from J. W. Cummins, in the Amo Mine, near Oroville, Butte Co., to deposit tailings in Cherokee Ravine, gives notice that a meeting will be held at Room 59, Flood Building, San Francisco, Cal., on February 28, 1898, at 1:30 P. M.

Commercial Paragraphs.

THE Pelton Water Wheel Co of San Francisco have shipped a complete wheel and pipe system for operating the Republic G. M. & M. Co's. mill, on the Colville reservation.

J. R. CLARK, Mgr. Los Alamitos beet sugar factory, has given an order to the Lacy Manufacturing Co. of Los Angeles for the construction of a 30,000-barrel tank, to be erected at the sugar factory.

A SHIPMENT to the Alton Mining Company of Albuquerque, New Mexico, of a 10-stamp mill, 850-pound rapid drop, crusher, four feeders, two concentrators, boiler, engine, etc., was made last week by the J. H. Montgomery Machinery Company, Denver, Colo.

THE E. P. Allis Co. of Milwaukee has a contract to furnish a 700,000 H. P. plant for the Metropolitan Street Railway Co. of New York. The order amounts to about $500,000, and the equipment will comprise one of the largest electric power plants in existence.

F. KAHN, a mining engineer from the City of Mexico, has on exhibition at 319 Bush street, room 108, a gold-saving machine that has the appearance of being practical and well adapted to conditions prevailing in Alaska, and in localities where water is scarce. It is claimed that a large number of these machines are in use in Mexico.

THE Royal George M. & M. Co. are putting in a Beam furnace and a fifty-ton amalgamating plant, to be erected near Canyon City, Colorado. The Colorado Iron Works Co. are furnishing the machinery and are putting in their patent high speed, narrow face rolls to do the crushing. The Colorado Iron Works Co. shipped five carloads of smelting machinery last week to the Buena Vista S. & R. Co., at Buena Vista, Colo.

WANTED.—Position to take charge of a quartz mine. Am a practical miner, and have had charge of a number of properties in different States for the last 20 years. Can furnish the best of reference. Address J. D., Mining and Scientific Press.

Position as Manager or Superintendent of Mines and Mill.—A mining engineer of 20 years' practical experience in mining, milling and placer mining, understands construction and operation of stamps, Huntington's and roller mills, amalgamation and concentration to any degree of fineness with jigs, buddles, vanners, bumpers, and Wilfley tables; makes surveys, maps and plans of mines and mills, and does practical assaying; experienced in handling free gold, and sulphurets of iron, copper, lead, zinc and quicksilver; can examine and report on mines; will be open for engagement about March 1, 1898. Box 30, Mining and Scientific Press.

A Physician,

aged 27, unmarried, wants position as company surgeon with a mining or construction company, or two years assistant surgeon in Cook County Hospital, Chicago. First-class references.

Address **R. U. CRAIG,**

Box 172.....Phœnix, Arizona.

DIVIDEND NOTICE.

JAMISON MINING COMPANY, Rooms 50 and 54, 9 Sutter St., San Francisco Cal., January 25th, 1898. DIVIDEND NUMBER ONE.—At their meeting of January 25th, 1898, it was resolved by the Board of Directors of the Jamison Mining Company to pay to the Stockholders of the Company from the surplus funds in the treasury, a dividend of Nineteen Thousand Five Hundred Dollars ($19,500), being Five Cents (5 cts.) per share on the capital stock of the Company. The dividend will be payable at the office of the Company on the Fifteenth (15th) day of February, 1898, to all stockholders of record on the Fifth (5th) day of February, 1898. Transfer books will be closed at the close of business on the 5th of February, and reopened on the morning of February 16, 1898. SAM. W. CHEYNEY, Secretary.

Assessment Notices.

THE ORLEANS MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Grass Valley Mining District, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 1st day of February, 1898, an assessment (No. 7, new series) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, No. 575 Mission street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 8th day of March, 1898, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 28th day of March, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

GEO. O. THURSTON, Secretary.

Office—No. 575 Mission street, San Francisco, California.

BALIOL GOLD MINING COMPANY. Location of principal place of business, San Francisco, California; location of works, Sutter Creek, Amador County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 26th day of January, 1898, an assessment (No. 2) of 30 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 7, fifth floor, Mills building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 4th day of March, 1898, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 28th day of March, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

R. L. CHENEY, Secretary.

Office—Mills building, room 7, fifth floor, San Francisco, California.

MARGUERITE GOLD MINING AND MILLING Company.—Location of principal place of business, San Francisco, California; location of works, Auburn, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 19th day of February, 1898, an assessment (No. 9) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 237 12th street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 6th day of April, 1898, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 2nd day of May, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

F. METTMANN, Secretary.

Office—237 12th street, San Francisco, California. Office hours from 5 to 6 o'clock P. M. The Secretary will also receive payments from 1 to 4 P. M. at his business office, 225 Sansome street.

DELINQUENT SALE NOTICE.

RED CAP MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Humboldt County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 2) levied on the 29th day of November, 1897, the several amounts set opposite the names of the respective shareholders, as follows:

Name.	No. Cert.	No. Shares.	Amt.
Harvey M. Binckley	2	1	5 00
Alice E. Binckley	20	4	20 00
Alice E. Binckley	23	20	100 00
Alice E. Binckley	24	20	100 00
Alice E. Binckley	25	20	100 00
Alice E. Binckley	26	20	100 00
Alice E. Binckley	39	1	5 00
Alice E. Binckley	40	2	10 00
Caroline S. Townsend	18	20	100 00

And in accordance with law, and an order from the Board of Directors, made on the 29th day of November, 1897, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the corporation, 125 Beale street, San Francisco, California, on SATURDAY, the 29th day of January, 1898, at the hour of 1 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

H. H. MARTIN, Secretary.

Office—125 Beale street, San Francisco, California.

POSTPONEMENT.

By order of the Board of Directors the day of sale of the above delinquent stock has been postponed to SATURDAY, February 26th, 1898, at the same hour and place. H. H. MARTIN, Secretary.

Office—125 Beale street, San Francisco, California.

DELINQUENT SALE NOTICE.

MARINA MARSICANO GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Sunny Hill, Shasta County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 12) levied on the 3rd day of January, 1898, the several amounts set opposite the names of the respective shareholders, as follows:

Name.	No. Cert.	No. Shares.	Amt.
L. P. Drexler	87	10	90
Leo Alexander, Trustee	85	17,990	1,619 10

And in accordance with law, and an order from the Board of Directors, made on the 3rd day of January, 1898, so many shares of each parcel of such stock as may be necessary will be sold at public auction, at the office of the company, 217 Sacramento street, San Francisco, California, on MONDAY, the 28th day of February, 1898, at the hour of 2 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale. CHARLES BOVONE, Secretary.

Office—217 Sacramento street, San Francisco, California.

Assessing Gold
.....AND.....
Silver Ores.
A Standard Work.

By C. H. AARON.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the pratical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores,") that have been "successfully popular," is written in a condensed form which renders his information more readily available than that of more wordy writers. The wan of such a work has long been felt. It will be very desirable in the hands of many.

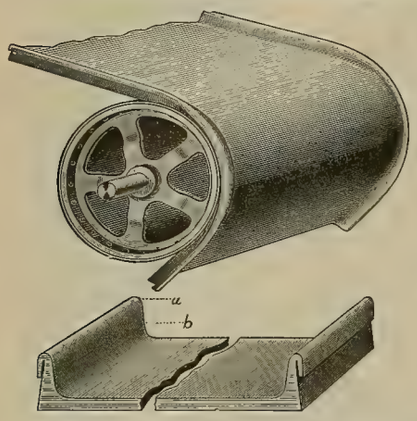

Table of Contents:—Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assay; Examples of cupellation; Weighing of Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests of Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 126 12-mo pages, with illustrations, well bound in cloth; 1896. Price **$1.00** postpaid. Sold by the **Mining and Scientific Press,** 330 Market St., San Francisco.

THE BROWNELL "PATENT LIP" FLANGE FRUE VANNER BELTS.

It has taken years of ceaseless testing and experimenting to produce the superior belt which we now offer, with elastic flanges and pliable body reinforced with specially woven duck. Every belt is manufactured by experienced workmen, and carefully tested on machines especially built for that purpose; consequently we are to-day manufacturing the best belts that mechanical ingenuity, combined with honesty of construction, can possibly produce.

SUPT. OFFICE WILDMAN GOLD MINING COMPANY,
SUTTER CREEK, AMADOR CO., CAL., Feb 22, 1897.

MR. JAS. S. BROWNELL, 132 Market St., San Francisco, Cal.—DEAR SIR: Replying to your favor of the 18th inst., will say that in the two mills operated by this company we have nineteen of your Patent Lip flange concentrator belts in use; some of them have been in constant use for the past two years and have given entire satisfaction. I know of no better flange for a side shake machine.
Yours truly, JOHN ROSS JR., Superintdenent.

MEXICAN MILL, EMPIRE, NEV., March 28, 1897.

MR. J. S. BROWNELL, San Francisco, Cal.—DEAR SIR: For some years we have used three different styles of belts on our Frue vanner at the Mexican mill, and for smooth working and endurance the Brownell Patent Lip flange belt has proved its superiority over all others, and I unhesitatingly recommend it to all who are using Frue machines. Yours truly, EUGENE MAY, Foreman.

Alaska Mining Companies.

The tales of treasure from farthest Alaska do not detract from the work of development going on in other parts of that immense area of gold-producing country. Great undertakings and great returns are in gold quartz properties, so singularly situated, in several instances, that the product from the mine goes by gravity to the vessel at the ocean wharf close by. At Berner's Bay, forty miles north of Juneau, on that arm of the sea known as Lynn canal, lie the properties of the Berner's Bay Milling & Mining Company, recently transferred to the Seward, Northern Belle and Ophir gold mining companies. In the Comet, among the holdings of the former company, the lower workings are the deepest in Alaska—1000 feet—depth there, as in other regions, demonstrating the permanency of the lode, for, as in California, Alaska claims the possession of a "mother lode." Herewith is presented a view of the 40-stamp mill of the B. B. M. & M. Co. A great amount of development work has been done, and the property possesses all the up-to-date adjuncts of a modern mining plant—electricity, compressed air, steam, wire-rope tramway, modern mill appliances, heavy, rapid-drop stamps, etc. Some of the ore from this mine is considered too rich to be blasted out in the ordinary way, but is mailed down with bar and sledge upon canvas spread on the floor of the drift to prevent scattering.

In Sheep Creek Basin the Nowell Gold Mining Company operate a 30-stamp mill, shown in the engraving. As in the case above cited, this property has many of the latest devices for economical working—a railway, aerial tramway, electric plant, etc. The mill tailings are worked by an extensive system of blanket sluices. These and other Alaska mines exhibit the unique sight of a quartz mine directly on the ocean coast, the Sheep Creek mill being but one-half mile in from the beach, where deep-sea-going vessels lie at the wharf. To the courtesy of the *Mining Record* of Juneau we are indebted for the use of the two handsome engravings.

FORTY-STAMP MILL OF THE BERNERS BAY, ALASKA, M. & M. CO.

THIRTY-STAMP MILL OF THE N. G. M. CO., SHEEP CREEK, ALASKA.

ONE of the recent decisions or rulings of the Commissioner of the General Land Office will be received with pleasure by many miners throughout this west half of America, namely: the granting to mining companies the privilege of cutting all the timber they need from the public lands of the United States, provided they follow the instructions of an inspector of the Land office, to be sent upon request, to designate what timber may be cut. It has long been a source of vexation and annoyance to miners everywhere to be restricted by the Government in getting sufficient timber to meet their actual requirements. In many instances miners, individually and corporate, have cut timber in violation of the existing regulations, and have been made defendants in suits brought against them by the Government for indemnity therefor. While wholesale destruction of our forest reserves by miners or anybody else is to be frowned upon, nevertheless, where timber of little value to the Government, but of exceeding necessity to miners in the immediate vicinity, is used, it is good policy every way to place the most favorable construction thereon; and if the new system of permitting the cutting of timber under governmental supervision does not prove too expensive, the concession made by Commissioner Hermann will be of considerable mutual advantage.

IN the issue of Nov. 27th was illustrated and described an innovation in old-time stamp mill foundations, being made in the building of a new 40-stamp mill by G. H. Evans at the Banner mine, near Oroville, Cal. So much attention was attracted by the notice of the replacing of the ordinary timber foundations by concrete blocks that it is of interest to learn, now that the mill is completed, that the new departure is found to be in every way satisfactory. The forty stamps, each weighing 1200 pounds, are dropping 110 times a minute and are crushing four and a half tons to the stamp of quartz ore per twenty-four hours.

Patents for Pacific Coast Inventors; Commercial Paragraphs, 261. Sampling Ore in Place; To Test the Purity of Water; Electricity at the Transmississippi Exposition, 265. Butte and Anaconda, Montana; The Desert Mines, 266. Good Foundry Practice, 267.

THERE are 2443 employes in the Department of Agriculture in Washington, D. C. The mineral yield of the nation for '98 will be worth $800,000,000. The prosperity of that industry lies at the base of our national wealth. No one interested in that industry wants 2443 Washington employes to care for it, but many think that it is entitled to one, possibly two.

IT IS PROPOSED to hold in San Francisco in 1900 an international exposition celebrating the fiftieth anniversary of California's admission into the Union. The idea is a good one, but the time is too short to carry out the announced plans on the scale proposed. That there should and will be commemoration of that event is certain, but that the celebration can assume the scope of an international exhibition is more than doubtful.

SENATOR SHOUP of Idaho is securing indorsements for his bill, introduced February 22, relieving silver mines and prospects from the annual assessment work required by law in cases where $1000 worth of work has already been performed upon them. As a temporary relief measure, it is not objectionable, if taken as the suspension of assessment acts in '93 and '94, but it would be a mistake to have such a bill be considered as a permanent policy. Senator Shoup's bill may go through the Senate, but it will have difficulty in passing the House of Representatives in any shape. As a general thing, no one should be relieved of the necessity of doing annual assessment work upon a mining claim until a United States patent is secured.

CONSIDERABLE is being made in the newspapers of Edison's alleged ability to extract gold from low-grade ore in mining camps without the use of water, and coupled with a statement of a recent large purchase of gold ore in New Mexico by him are assertions of what he is "going" to do and the wonderful results that "will be" achieved. While it would be in every way desirable that these extravagant claims were realized, it would seem that the name of the great inventor is being used to conjure with. Edison's wonderful genius has enriched the world with valuable inventions, but it is to be noticed that whenever he has essayed to work gold in black sand, iron in magnetic ore, or any other metallurgical project, the work has (so far as known) not been a financial success. Much of fancy and folly appear in the daily press unfairly attributed to Edison, and this last is open to doubt.

EVERY ESTABLISHMENT in San Francisco capable of supplying vessels for the Yukon trade is busy, and the same may be said of all other coast ports. In addition steam and sail craft are arriving and due from Atlantic ports, and anything that can be utilized is put into service. Several vessels have sailed from Puget sound unfit for service in even smooth inland waters, and much loss of life and property has resulted. The mining fair held in San Francisco during the last few weeks has stimulated the business of outfitters and suppliers for the Klondike trade, and the excitement is still at its height. The result of the present northern hegira will be—apart from terrible suffering and hardship—a general movement out of British territory into Alaska, which will be exploited and advanced a century. The ebb tide of miners and prospectors will aid in the development of the country to the south, and, eventually, California will find successful and unsuccessful alike drifting down, the former to spend their money, the latter to try renewed luck amid more pleasant surroundings.

THE Golden Jubilee Mining Fair closes to-night. Apart from any other effect it has been a good advertisement for California. The receipts and expenses aggregate approximately $75,000, the one item about balancing the other. The first enterprise of the kind in the history of the world, hastily organized, with practically no subsidy, and depending for patronage on the general public, the mining exposition just closed in this city can be counted a success. Even had not a dollar of the thirty-five thousand or forty thousand dollars that it cost been returned in the way of concessions or gate receipts, the expenditure would have been a splendid investment for California. As it is, the management is to be congratulated on having secured at so little cost so great an advertisement of the mineral resources of the State. The Fair covered a period of five weeks, beginning January 29th, and apart from the regular mining exhibit included some "side shows" and attractions which, strictly speaking, had no place therein, but drew the crowd and in that way made the continuance of the entire enterprise possible. It is a matter of regret that the splendid mineral exhibit cannot be preserved intact. Indeed there are many features of the Fair that deserve permanence. The exhibition of mining machinery and appliances was a source of education to many, it being particularly noticeable throughout the entire exposition that that part of the Pavilion devoted to mining appliances in practical operation was constantly thronged. The general result to the merchants and manufacturers of this city is increase of trade and exemplification of what can be done. That there were shortcomings must be admitted in regard to this, as in relation to any other human enterprise, but it is always easier to indicate what might have been done, or what should not have been done, than to improve upon what is actually being done. The management deserve commendation for their untiring efforts by which the city and State benefited.

MR. E. C. BRYCE of Chicago objects to ridicule, and as a prominent manufacturer of gold from the goodness of his heart furnishes the formula used by him in the industry. Mr. Bryce says that all there is to it is the following:

Take of chemically pure antimony five parts; sulplur, ten parts; iron, one part; caustic soda, four parts. Place these ingredients in a graphite crucible and expose to a white heat of 5000 degrees from eight to forty-eight hours. Powder the resulting mass and mix it well to incorporate the metal with slag. Combine this with charcoal, one part; oxide of lead, five parts, and caustic soda, four parts. Fuse the whole until a metallic button is obtained. Scarify and cupola this metallic mass and the resulting lead will be gold and silver.

The simple publication of the above ought to check any further hilarity on the part of the metallurgical world. Nothing more graphic and conclusive can be conceived. There may be some difficulty when it comes to "scarify and cupola," some assayers in their blindness probably attempting to "scorify and cupel;" but little matters like that, of course, are only details. He says the commercial process is now protected, and as the volcanic heat required can only be attained in his furnaces, no mystery is necessary. It has all along been understood that Mr. Bryce's process of making gold was different from that of Mr. Emmens of New York, who compresses silver under cold pressure; and likewise from that of Mr. Marshall of Missouri, who can evolve gold from sulphur and iron without even the trouble of securing antimony or soda, caustic or otherwise. Mr. Bryce also alleges that he is "engaged in the manufacture of ore," which, he says, "yields $1500 to the ton in gold and silver." The whole subject is still discussed in several journals, and correspondence indicates that there is a lingering desire of belief in the minds of many, and a sort of misty hope, that the impossible can come within the realm of scientific discussion. As compared with the men who believe in the statements of the gold manufacturers, the men at present most keenly afflicted with Klondicitis are marvels of sensibly directed energy.

FROM a tunnel company, which announces its business office as being at 131 West Second Avenue, Denver, Colo., is received a handsomely illustrated pamphlet describing its property, and which, (according to the pamphlet) "bears an honest name," which, under the circumstances, is a pleasant thing to know. Some of its contents exhibit two of the most remarkable coincidences in the history of mining properties. On page 17 of the Colorado publication is an engraving of a "vein and stope above a tunnel level" near Ward, Colo. An engraving in this journal of November 6, 1897, showed a vein on the 1400-foot level of the Maryland mine, in Nevada county, California, from a flash-light photograph, which then appeared for the first time in any journal. The engraving referred to on page 17 of the Colorado pamphlet just issued, is precisely the same as that which appeared in the description of the Maryland mine in this State in the issue of this paper of November 6, 1897. In the same issue of the MINING AND SCIENTIFIC PRESS, in describing the vein structure of quartz mines in Nevada county, California, appeared another large engraving, also made from a flash-light photograph, showing the brecciating of a hanging wall in the stope above the 1500-foot level of the Maryland mine, California. On page 23 of the Colorado publication referred to is a picture precisely the same in every feature, and which is, according to the book, "from a photograph taken in the stope of the Ann Arbor vein," Colorado. The description of the cut in the Colorado pamphlet goes on to say that "the ore is not shown the entire width for the reason of its great width, 47 feet. This great body of ore has run all the way from $4 to $1128.58, etc." and goes on to enlarge upon the desirability of immediate purchase of stock in the enterprise. The natural surprise that is occasioned by the knowledge of the fact that every detail of the appearance of the vein on the 1400-foot level of the Maryland mine in California is exactly reproduced in the San Blas vein in Colorado, is enhanced by the exactly alike condition of affairs above the 1500-foot level of the Maryland mine in this State and the stope of the Ann Arbor vein in Colorado: the figures of the men at work, the separation of the vein matter, and every detail being precisely the same in both instances. Indeed, any one uncharitably disposed might say that the pictures in the Colorado publication were an exact reproduction of the California underground mining scenes; and that so far as the Colorado tunnel company—which "bears an honest name"—is concerned, the whole thing is a contemptible piece of theft and misrepresentation, unworthy the name and fame of any Colorado company and deserving of censure.

A CANADIAN contemporary notes the most lavish management in the De Beers Consolidated Mines. The auditors' fees for 1896–7 amounted to $7000, while the directors' fees attained the still heavier total of $77,250. In addition to this the life governor's remuneration for the year came out at $601,825. Donations were presented to public institutions during the year to the amount of $107,695, and altogether the general charges of the year aggregated $464,690. In the twelve months ending June 30, 1897, the diamonds made available for sale realized $11,166,297. The working expenses of the year including $917,075 debenture interest, and $877,620 written off for machinery and plant, were $8,487,690 leaving a balance of $10,162,805, increased to $11,313,150 by the balance brought forward from 1895-6 dividends on investments, rents and miscellaneous items of revenue. Out of the final balance of $11,313,150, dividends were distributed to the amount of $7,897,910, leaving $3,415,240 to be carried forward to the credit of the ensuing year.

United States Mining Laws, and Regulations Thereunder, Relative to the Reservation, Exploration, Location, Possession, Purchase and Patenting of the Mineral Lands in the Public Domain.

NUMBER III.

44. The claimant is then required to post a copy of the plat of such survey in a conspicuous place upon the claim, together with notice of his intention to apply for a patent therefor, which notice will give the date of posting, the name of the claimant, the name of the claim, the mining district and county, whether or not the location is of record, and, if so, where the record may be found, giving the book and page thereof; the number of feet claimed along the vein and the presumed direction thereof; the number of feet claimed on the lode in each direction from the point of discovery or other well-defined place on the claim; the names of all adjoining and conflicting claims, or, if none exist, the notice should so state.

45. After posting the said plat and notice upon the premises, the claimant will file with the proper register and receiver a copy of such plat and the field notes of survey of the claim, accompanied by the affidavit of at least two credible witnesses that such plat and notice are posted conspicuously upon the claim, giving the date and place of such posting; a copy of the *notice* so posted to be attached to and form a part of said affidavit. The plat forwarded as part of the proof should not be *folded*, but *rolled*, so as to prevent creasing, and either transmitted in a separate package or so enclosed with the other papers that it may pass through the mails without creasing or mutilation. If forwarded separately, the letter transmitting the papers should state the fact.

46. Accompanying the field notes so filed must be the sworn statement of the claimant that he has the possessory right to the premises therein described, in virtue of a compliance by himself (and by his grantors, if he claims by purchase) with the mining rules, regulations and customs of the mining district, State or Territory in which the claim lies, and with the mining laws of Congress; such sworn statement to narrate briefly, but as clearly as possible, the facts constituting such compliance, the origin of his possession and the basis of his claim to a patent.

47. This sworn statement must be supported by a copy of the location notice, certified by the officer in charge of the records where the same is recorded, and where the applicant for patent claims the interests of others associated with him in making the location, or only as purchaser, in addition to the copy of the location notice, must be furnished a complete abstract of title as shown by the record in the office where the transfers are by law required to be recorded, certified to by the officer in charge of the record, under his official seal. The officer should also certify that no conveyances affecting the title to the claim in question appear of record other than those set forth in the abstract, which abstract shall be brought down to the date of the application for patent. Where the applicant claims as sole locator, his affidavit should be furnished to the effect that he has disposed of no interest in the land located.

48. In the event of the mining records in any case having been destroyed by fire or otherwise lost, affidavit of the fact should be made, and secondary evidence of possessory title will be received, which may consist of the affidavit of the claimant, supported by those of any other parties cognizant of the facts relative to his location, occupancy, possession, improvements, etc., and in such case of lost records, any deeds, certificates of location or purchase, or other evidence which may be in the claimant's possession and tend to establish his claim, should be filed.

49. Before receiving and filing a mineral application for patent, local officers will be particular to see that it includes no land which is embraced in a prior or pending application for patent or entry, or for any lands embraced in a railroad selection, or for which publication is pending or has been made by any other claimants, and if, in their opinion, after investigation, it should appear that a mineral application should not, for these or other reasons, be accepted and filed, they should formally reject the same, giving the reasons therefor, and allow the applicant thirty days for appeal to this office under the Rules of Practice.

50. Upon the receipt of these papers, if no reason appears for rejecting the application, the register will, at the expense of the claimant (who must furnish the agreement of the publisher to hold applicant for patent alone responsible for charges of publication), publish a notice of such application for the period of sixty days in a newspaper published nearest to the claim, and will post a copy of such notice in his office for the same period. When the notice is published in a *weekly* newspaper, ten consecutive insertions are necessary; when in a *daily* newspaper, the notice must appear in each issue for sixty-one consecutive issues, the first day of issue being excluded in estimating the period of sixty days.

51. The notices so published and posted must be as full and complete as possible, and embrace all the *data* given in the notice posted upon the claim. Too much care cannot be exercised in the preparation of these notices, inasmuch as upon their accuracy and completeness will depend, in a great measure, the regularity and validity of the whole proceeding.

52. The register shall publish the notice of application for patent in a paper of established character and general circulation, to be by him designated as being the newspaper published nearest the land.

53. The claimant, either at the time of filing these papers with the register or at any time during the sixty days' publication, is required to file a certificate of the surveyor-general that not less than five hundred dollars' worth of labor has been expended or improvements made upon the claim, and if more than one claim is included in the application, that an amount equal to five hundred dollars for each claim has been expended by the applicant or his grantors; that the plat filed by the claimant is correct; that the field notes of the survey, as filed, furnish such an accurate description of the claim as will, if incorporated into a patent, serve to fully identify the premises, and that such reference is made therein to natural objects or permanent monuments as will perpetuate and fix the *locus* thereof.

54. The surveyor-general should derive his information, upon which to base his certificate as to the value of labor expended or improvements made, from his deputy who makes the actual survey and examination upon the premises, and such deputy should specify with particularity and full detail the character and extent of such improvements.

55. It will be the more convenient way to have this certificate indorsed by the surveyor-general, both upon the plat and field notes of survey filed by the claimant as aforesaid.

56. After the sixty days' period of newspaper publication has expired, the claimant will furnish from the office of publication a sworn statement that the notice was published for the statutory period, giving the first and last day of such publication, and his own affidavit showing that the plat and notice aforesaid remained conspicuously posted upon the claim sought to be patented during said sixty days' publication, giving the dates.

57. Upon the filing of this affidavit the register will, if no adverse claim was filed in his office during the period of publication, permit the claimant to pay for the land according to the area given in the plat and field notes of survey aforesaid, at the rate of five dollars for each acre and five dollars for each fractional part of an acre, except as otherwise provided by law, the receiver issuing the usual duplicate receipt therefor. The claimant will also make a sworn statement of all charges and fees paid by him for publication and surveys, together with all fees and money paid the register and receiver of the land office, after which the complete record will be forwarded to the Commissioner of the General Land Office and a patent issued thereon if found regular.

PROTEST.

58. At any time prior to the issuance of patent, protest may be filed against the patenting of the claim as applied for, upon any ground tending to show that the applicant has failed to comply with the law in a matter which would avoid the claim. Such protest cannot, however, be made the means of preserving a surface conflict lost by failure to adverse or lost by the judgment of the court in an adverse suit. One holding a present joint interest in a mineral location included in an application for patent who is excluded from the application, so that his interest would not be protected by the issue of patent thereon, may protest against the issuance of a patent as applied for, setting forth in such protest the nature and extent of his interest in such location, and such a protestant will be deemed a party in interest entitled to appeal. This results from the holding that a co-owner excluded from an application for patent does not have an "adverse" claim within the meaning of sections 2325 and 2326 of the Revised Statutes. See Turner vs. Sawyer, 150 U. S., 578-586.

59. Any party applying to make entry as *trustee* must disclose fully the nature of the trust and the name of the *cestui que trust*; and such trustee, as well as the beneficiaries, must furnish satisfactory proof of citizenship, and the names of beneficiaries, as well as that of the trustee, must be inserted in the final certificate of entry.

PLACERS.

60. The proceedings to obtain patents for claims usually called placers, including all forms of deposit, excepting veins of quartz or other rock in place, are similar to the proceedings prescribed for obtaining patents for vein or lode claims; but where said placer claim shall be upon surveyed lands, and conforms to legal subdivisions, no further survey or plat will be required, and all placer mining claims located after May 10, 1872, shall conform as nearly as practicable with the United States system of public-land surveys and the rectangular subdivisions of such surveys, and no such location shall include more than twenty acres for each individual claimant; but where placer claims cannot be conformed to legal subdivisions, survey and plat shall be made as on unsurveyed lands. But where such claims are located previous to the public surveys, and do not conform to legal subdivisions, survey, plat and entry thereof may be made according to the boundaries thereof, provided the location is in all respects legal.

61. The proceedings for obtaining patents for veins or lodes having already been fully given, it will not be necessary to repeat them here, it being thought that careful attention thereto by applicants and the local officers will enable them to act understandingly in the matter and make such slight modifications in the notice, or otherwise, as may be necessary in view of the different nature of the two classes of claims, placer claims being fixed, however, at two dollars and fifty cents per acre, or fractional part of an acre.

SEC. 2333, R. S. Where the same person, association or corporation is in possession of a placer claim, and also a vein or lode included within the boundaries thereof, application shall be made for a patent for the placer claim, with the statement that it includes such vein or lode, and in such case a patent shall issue for the placer claim, subject to the provisions of this chapter, including such vein or lode, upon the payment of five dollars per acre for such vein or lode claim, and twenty-five feet of surface on each side thereof. The remainder of the placer claim, or any placer claim not embracing any vein or lode claim, shall be paid for at the rate of two dollars and fifty cents per acre, together with all costs of proceedings; and where a vein or lode, such as is described in section twenty-three hundred and twenty, is known to exist within the boundaries of a placer claim, an application for a patent for such placer claim which does not include an application for the vein or lode claim shall be construed as a conclusive declaration that the claimant of the placer claim has no right of possession of the vein or lode claim; but where the existence of a vein or lode in a placer claim is not known, a patent for the placer claim shall convey all valuable mineral and other deposits within the boundaries thereof.

62. The first care in recognizing an application for patent upon a placer claim must be exercised in determining the exact classification of the lands. To this end the clearest evidence of which the case is capable should be presented.

(1) If the claim be all placer ground, that fact must be stated in the application and corroborated by accompanying proofs; if of mixed placers and lodes, it should be so set out, with a description of all known lodes situated within the boundaries of the claim. A specific declaration, such as is required by section 2333, Revised Statutes, must be furnished as to each lode intended to be claimed. All other known lodes are, by the silence of the applicant, excluded by law from all claim by him, of whatsoever nature, possessory or otherwise.

(2) Deputy surveyors shall, at the expense of the parties, make full examination of all placer claims surveyed by them, and duly note the facts as specified in the law, stating the quality and composition of the soil, the kind and amount of timber and other vegetation, the *locus* and size of streams and such other matters as may appear upon the surface of the claim. This examination should include the character and extent of all surface and undergrodnd workings, whether placer or lode, for mining purposes.

(3) In addition to these data, which the law requires to be shown in all cases, the deputy should report with reference to the proximity of centers of trade or residence, also of well-known systems of lode deposit or of individual lodes. He should also report as to the use or adaptability of the claim for placer mining; whether water has been brought upon it in sufficient quantity to mine the same or whether it can be procured for that purpose, and, finally, what works or expenditures have been made by the claimant or his grantors for the development of the claim and their situation and location with respect to the same as applied for.

(4) This examination should be reported by the deputy under oath to the surveyor-general, and duly corroborated, and a copy of the same should be furnished with the application for patent to the claim, constituting a part thereof, and included in the oath of the applicant.

(5) Applications awaiting entry, whether published or not, must be made to conform to these regulations, with respect to examination as to the character of the land. Entries already made will be suspended for such additional proofs as may be deemed necessary in each case.

MILL SITES.

63. Mill sites are not mineral entries. On the contrary, the land entered must be shown to be nonmineral. They are simply auxiliary to the working of mineral claims, but as the section granting the right of entry is embraced in the chapter of the Revised Statutes relating to mineral lands, they are therefore included herewith.

SEC. 2337, R. S. Where nonmineral land not contiguous to the vein or lode is used or occupied by the proprietor of such vein or lode for mining or milling purposes, such nonadjacent surface ground may be embraced and included in an application for a patent for such vein or lode, and the same may be patented therewith, subject to the same preliminary requirements as to survey and notice as are applicable to veins or lodes; but no location hereafter made of such nonadjacent land shall exceed five acres, and payment for the same must be made at the same rate as fixed by this chapter for the superficies of the lode. The owner of a quartz mill or reduction works, not owning a mine in connection therewith, may also receive a patent for his mill site, as provided in this section.

64. To avail themselves of this provision of law parties holding the possessory right to a vein or lode, and to a piece of nonmineral land not contiguous thereto, for mining or milling purposes, not exceeding the quantity allowed for such purpose by section 2337, United States Revised Statutes, or prior laws, under with the land was appropriated, the proprietors of such vein or lode may file in the proper land office their application for a patent, under oath, in manner already set forth herein, which application, together with the plat and field notes, may include, embrace, and describe, in addition to the vein or lode, such noncontiguous mill site, and after due proceedings as to notice, etc., a patent will be issued conveying the same as one claim. The owner of a patented lode may, by an independent application, secure a mill site if good faith is manifest in its use or occupation in connection with the lode and no adverse claim exists.

65. Where the original survey includes a lode claim and also a mill site the lode claim should be described in the plat and field notes as "Sur. No. 37, A," and the mill site as "Sur. No. 37, B," or whatever may be its appropriate numerical designation; the course and distance from a corner of the mill site to the corner of the lode claim to be invariably given in such plat and field notes, and a copy of the plat notice of application for patent must be conspicuously posted upon the mill site as well as upon the vein or lode for the statutory period of sixty days. In making the entry no separate receipt or certificate need be issued for the mill site, but the whole area of both lode and mill site will be embraced in one entry, the price being five dollars for each acre and fractional part of an acre embraced by such lode and mill-site claim.

66. In case the owner of a quartz mill or reduction works is not the owner or claimant of a vein or lode the law permits him to make application therefore in the same manner prescribed herein for mining claims, and after due notice and proceedings, in the absence of a valid adverse filing, to enter and receive a patent for his mill site at said price per acre.

67. In every case there must be satisfactory proof that the land claimed as a mill site is not mineral in character, which proof may, where the matter is unquestioned, consist of the sworn statement of two or more persons capable, from acquaintance with the land, to testify understandingly.

PROOF OF CITIZENSHIP.

SEC. 2321, R. S. Proof of citizenship under this chapter, may consist, in the case of an individual, of his own affidavit thereof; in the case of an association of persons unincorporoted, of the affidavit of their authorized agent, made on his own knowledge or upon information and belief; and in the case of a corporation organized under the laws of the united States, or of any State or Territory thereof by the filing of a certified copy of their character or certificate of incorporation.

68. The proof necessary to establish the citizenship of applicants for mining patents must be made in the following manner: In case of an incorporated company, a certified copy of their charter or certificate of incorporation must be filed. In case of an association of persons unincorporated, the affidavit of their duly authorized agent, made upon his own knowledge or upon information and belief, setting forth the residence of each person forming such association, must be submitted. This affidavit must be accompained by a power of attorneys from the parties forming such association, authorizing the person who makes the affidavit of citizenship to act for them in the matter of their application for patent.

69. In case of an individual or an association of individuals who do not appear by their duly authorized agent, you will require the affidavit of each applicant, showing whether he is a native or naturalized citizen, when and where born, and his residence.

70. In case an applicant has declared his intention to become a citizen or has been naturalized, his affidavit must show the date, place, and the court before which he declared his intention, or from which his certificate of citizenship issued, and present residence.

71. The affidavit of the claimant as to his citizenship may be taken before the register or receiver, or any other officer authorized to administer oaths within the land district; or, if the claimant is residing beyond the limites of the district, the affidavit may be taken before the clerk of any court of record or before any notary public of any State or Territory.

72. If citizenship is established by the testimony of disinterested persons, such testimony may be taken at any place before any person authorized to administer oaths, and whose official character is duly verified.

73. In sending up the papers in the case the register must not omit certifying to the fact that the notice was posted in his office for the full period of sixty days, such certificate to state distinctly when such posting was done and how long continued.

74. No entry will be allowed until the register has satisfied himself, by a careful examination, that proper proofs have been filed upon all the points indicated in official regulations in force, and that they show a sufficient *bona fide* compliance with the laws and such regulations.

75. The consecutive series of numbers of mineral entries must be continued, whether the same are of lode or placer claims or mill sites.

POSSESSORY RIGHT.

SEC. 2332, R. S. Where such person or association, they and their grantors, have held and worked their claims for a period equal to the time prescribed by the statute of limitations for mining claims of the State or Territory where the same may be situated, evidence of such possession and working of the claims for such period shall be sufficient to establish a right to a patent thereto under this chapter, in the absence of any adverse claim; but nothing in this chapter shall be deemed to impair any lien which may have attached in any way whatever to any mining claim or property thereto attached prior to the issuance of a patent.

76. This provision of law will greatly lessen the burden of proof, more especially in the case of old claims located many years since, the records of which, in many cases, have been destroyed by fire, or lost in other ways during the lapse of time, but concerning the possessory right to which all controversy or litigation has long been settled.

77. When an applicant desires to make his proof of possessory right in accordance with this provision of law he will not be required to produce evidence of location, copies of conveyances, or abstracts of title, as in others cases, but will be required to furnish a duly certified copy of the statute of limitation of mining claims for the State or Territory, together with his sworn statement giving a clear and succinct narration of the facts as to the origin of his title, and likewise as to the continuation of his possession of the mining ground covered by his application; the area thereof; the nature and extent of the mining that has been done thereon; whether there has been any opposition to his possession, or litigation with regard to his claim and, if so, when the same ceased; whether such cessation was caused by compromise or by judicial decree, and any additional facts within the claimant's knowledge having a direct bearing upon his possession and bona fides which he may desire to submit in support of his claim.

(To be Continued.)

Concerning Certain Physical Theories.

To the Editor:—The most extraordinary absurdity ever seriously believed by scientists is the theory of an ether filling all space and the interstices of matter. Of direct proof there is none. The indirect is the supposed necessity for a means of travel for rays of light, heat, action, sun, electricity, etc., between celestial bodies. I am one of those who believe no such interplanetary rays exist. What seem such to our senses are only some of the protean forms of the one great force which we may, perhaps, call gravitation.

In support of the ether theory, it is alleged to be an axiom that "matter cannot act where it is not." This is an assumption merely. Atoms and molecules of matter do not touch, yet they act on each other, both by attraction and repulsion. The so-called axiom depends on the assumed ether, and two assumptions cannot mutually prove each other. Our ignorance of matter is so dense we should be very guarded in speculation. This ether is thought by some to be matter diffused thinly, but with absolute uniformity—thin space—though means for securing this uniformity have not yet been invented. If matter, it must be subject to gravitation, and every passing planet or meteor would capture some of it and leave either a vacancy or a thin place behind, across which light could not travel. One eminent scientist estimated this matter to weigh 1 lb. for 1,000,000,000 cubic miles. The H. P. transmitted from sun to earth is estimated at about 5,000,000 per square mile of earth. Imagine this force carried from sun to earth in 8 min. by one or two ounces of gas! Lord Kelvin says the ether is an "elastic solid." Others say a "frictionless fluid;" others a "continuum," though what these words mean, no one knows. Brewster, quoted by Tyndall, calls the ether a "clumsy contrivance." Kelvin says it is a "reality of science." The inventors of the ether intended it to transmit the stresses of gravitation, as "matter could not act where it was not."

The pull of the sun on the earth has been estimated at three and one-half million million tons, equal to twenty-two tons per square inch of earth's great inch. The best steel will not safely bear over four tons. The sunpull per square inch on Venus and Mercury would be two and three times that on earth. What of double stars, when two great suns are held together? Suppose Jupiter to fall to the sun. While still 100,000 miles away, the attraction per inch would be 300 million times what it is now on earth. Such figures point to the fact that gravitation cannot be conveyed by a material medium. The direction of gravitational stress is thought to be the same as in a stretched cord, but this can hardly be. If heat travels from its source, the store in that source is diminished. We cannot suppose that the amount of gravitation in any atom can be diminished or taken away, and hence that gravitation is not an emanation and does not travel and hence needs no road to travel on. But let us touch gravitation and the origin of life delicately.

The solar system moves forward rapidly, perhaps five miles per second—thin space. Thus, so far as useful effect on the planets is concerned, not one-millionth of the ether could be of any use at all, and that for only a few seconds thenceforth, thin eternity, useless. The filling of space with ether for the sole purpose of an occasional push to a wave of light is no more absurd than it would be, in order for a lady to take a buggy ride, to pack the whole American continent as full of horses as they could stand, each pushing the buggy a foot or so with his nose. The folly and waste would be no greater.

If the ether is an actual physical something, wherein actual vibrations transmit light, how can such light travel trillions of miles from star to star in straight lines, absolutely straight whether passing thin, cold space or by blazing suns—criss-cross, wave crossing wave in a thousand ways, yet unchangeable, unaffected by gravity, heat, cold, or electricity. Nothing but gravitation has those attributes. If ether is ponderable matter, as Kelvin insists, and vibrates as fast as the wave theory of light calls for, the force required to effect such vibrations is beyond calculation. Kelvin says "such vibrations in steel or brass would be measured by millions and millions and millions of tons' action on a square inch. There are no such forces in our air." Merely to state this is to raise an unanswerable objection to both the ether hypothesis and the wave theory of light. To digress a moment: the latter asks us to believe that a glow worm, whose light in a summer's night may be clearly seen a hundred yards, sets up vibrations beyond the engine power of the greatest ocean steamer, say 18,000 H. P. A candle, if seen a mile, would set in vibration at least three cubic miles of ether. The H. P. is beyond my calculation, and beyond my credulity. There are no such forces in action, and I risk little in maintaining the impossibility, in actual ponderable matter, of any such to-and-fro movement as common theory of light calls for—800 million of millions per second.

The motion of planets and comets shows not the least retardation and proves conclusively that there is no retarding medium in space. To meet this argument, ether was made very tenuous; but the fact of meteors of a few ounces or grains keeping up a velocity of forty to sixty miles per second is too strong an argument for even the thinnest ether. And talk of a frictionless fluid or solid is using words, not ideas, as to talk of matter having four or five or twenty dimensions.

Ether cannot be ponderable and subject to gravitation, else the sun and planets would attract it and absorb it. If they did not, then the ether would pile up in front and develop heat to an enormous degree. If a planet meets stationary ether, does the ether pass then the earth, or turn aside? It cannot be capable of heat or heat expansion, else it would be a very different thing here and in space—a gas in the sun, solid in space, liquid intermediate. If not capable of heat motion itself, how can it convey heat motion? If a continuum, how can vibrations occur without local condensations and rarefactions? How can a continuum be condensed or rarefied? If a tenuous gas, means must be invented to diffuse it equally, else if thick and thin at hazard it would fail of its object, and light rays would surely be crooked. If it diffuses itself by virtue of inherent repulsive forces, it must have balancing attractive forces, else it would diffuse itself endlessly, unless indeed we assume that Nature packed the universe just so full and there is no place to expand into. If it is very tenuous, the atoms must be wide apart. How, then, can they convey anything from one to another if it be true that matter cannot act where it is not. If the atoms be in actual contact, it is, to me at least, absolutely inconceivable how a planet can push them aside, causing two or a hundred atoms to occupy the same space at the same time. Matter to get out of the way of the sun would have to travel from center to edge of sun, 400,000 miles, in a very small fraction of a second—a lively movement.

In short, whatever way we turn we meet difficulties more and more, a dozen for every one supposed to be removed by the hypothesis. Surely a sound philosophy would bid us seek an explanation involving consequences less inconceivable.

Auburn, Cal. W. S. Prosser.

Another View of the Edison Ore Process.

In the issue of Nov. 13th, '97, appeared an extensive technical description of the Edison Magnetic Iron Works at Iron Mountain, New Jersey. Every publication on the Atlantic slope giving the matter any consideration claimed that the practical result of the enterprise would save the region east of the Alleghanies from losing the iron industry. As our readers well know, there is a tremendous battle between the iron and steel industries of that part of the United States and the Lake Superior region. Commercial and industrial supremacy are at stake, and incidentally the industries of Great Britain are in view. In the article referred to full statement was made of the commercial claims that would result from the successful operation of the Edison process. As was to be expected, the Lake Superior region does not view this idea with comfort, and in a letter from Ishpeming, H. J. Stevens in the *American Manufacturer* says:

"There is nothing in the Edison process of iron ore reduction of commercial value. Neither is there anything about the process which is especially novel. This assertion may sound like heresy to those who by reason of his many important inventions have been brought to regard Mr. Edison as a veritable wizard, before whom impossibilities vanish; it is, however, a plain statement of facts well known to the better posted metallurgists of the country. Mr. Edison has been laboring on his process of ore reduction for the past ten years, and nearly a decade ago had a small experimental plant at Humboldt, eleven miles west of Ishpeming, in charge of a Mr. Hussey. Later, Mr. Edison built a small plant at Spurr mountain, Baraga county, twenty-six miles west of Ishpeming, and experiments were carried on in this district for a number of years, the whole work being eventually transferred to New Jersey, where Mr. Edison had meantime secured control of several thousand acres underlaid by large deposits of low-grade iron ores."

The process of iron ore reduction, or the separation of the ore from its accompanying gangue of quartz, jasper, sandstone or other rock, has been the subject of much experimenting in this and foreign countries during the present century. In the Chateaugay ore district of New York, near Lake Champlain, the quartz gangue is removed by crushing and washing. A somewhat similar process has recently been quite extensively tested at the Pewabic mine, Iron Mountain, Mich., with indications of success. The Pewabic is controlled by the Oliver Mining Company of Pittsburg, the corporation which looks after the iron interests of the great Carnegie Steel Company, now the largest manufacturer of steel in the world, the Carnegie Company having succeeded Friederich Krupp of Essen, Germany, in that proud position. The Negaunee concentrating works at Negaunee, three miles east of Ishpeming, Mich., in 1882, at a cost of $200,000, made a failure of the separation of iron ore and jasper, by a process of crushing and separation by specific gravity. The concern turned out a total of 12,618 gross tons of refined ore in four years, although in actual operation for about one year only, at a loss upon every ton, and the loss upon the heavy investment was practically a total one. The Marquette Ore Company sorted over the rock burrows of the Winthrop mines ten years ago, by hand labor, but did not put in machinery for the reduction of mixed ores as was originally contemplated, hence closed its existence with a profit to its promoters. The Republic Reduction Company was organized by wealthy mining men of the copper district, and secured control of the immense rock burrows of the Republic mine, containing over 3,000,000 tons of mixed ore and rock, at a very low royalty upon the ore saved. The best efforts of skilled miners and metallurgists were put in the efforts on this concern during 1888 and the two following years, but the work was a failure, though skillfully performed and with ample capital.

Various methods of ore reduction have been tried in European iron fields with indifferent results or flat failure, the only exception being in the case of the process of Jonas Venstrom of Sweden, who devised a magnetic separator which was patented in several countries, including the United States, some ten years ago, or at about the time when Mr. Edison began his experiments in the same direction. A son of the inventor, Olaf Venstrom, spent several years in this district, and for some time operated a test plant at the Michigamme mine, twenty-four miles west of Ishpeming. The plant was a metallurgical but not a commercial success. The Venstrom process is now in use in several mines of the Gellivare and Orebro iron ore fields of Sweden, where it is giving fair satisfaction. The conditions governing Swedish and American iron mining are so radically different that ore concentration is not likely to prove profitable here until there is an end in sight to the apparently limitless deposits of ore of superior quality now opened in one hundred or more mines in the five great ore ranges of the Lake Superior region.

"The Edison experiments have been closely watched by leading mining men for several years past, as they felt that he could render ore concentration a success if anyone could. Mr. Edison's New Jersey plant is running and is turning out briquettes of a very superior grade of ore, but the ore is costing Mr. Edison more than he can sell it for, and there is every reason to believe that such will continue the case. It is difficult to point out where further economies can be introduced in his process, which is really a marvel of ingenuity, even though likely to never succeed from a financial point of view. The entire work is done by machinery, and the plant is a beautiful one. The work is performed with the utmost economy and skill, but ore can be sold the furnaces at a profit by Lake Superior mines cheaper than the Edison plant can deliver it. The trouble is a fundamental one—there is nothing wrong with the process from a mechanical standpoint, but where ore of a grade equal to the product of the concentrating plant can be scooped out of the ground with steam shovels, ore reduction machinery is baffled. The published reports of the Edison process and works have been somewhat misleading in some respects. It is not true that the big steam shovel at Edison does all the mining. The ore is quite refractory and must be shattered by dynamite, the holes for which are sunk by power drills, previous to loading into cars by the steam shovel. At the leading Mesabi mines the ore is soft and is scooped out of the lode by the shovels without blasting. The ore measures at Edison are extensive, but they are puny indeed compared with the lenses of the Mesabi and even of the other ranges of Lake Superior. One Mesabi mine, the Mahoning, has 75,000,000 tons of ore in sight.

"The sole advantage possessed by the Edison mines and plant is their proximity to the seaboard. The average lake freight from Duluth to Lake Erie ports was but 70 cents per gross ton on iron ore last year, and this rate will gradually be lowered with the increasing capacity of the lake vessels, soon to have a 20-foot channel from Duluth to Buffalo. The tendency of rail freights is also downward.

"Some of the more favorably situated Mesabi mines do the actual mining of their ore for less than 10 cents per ton—one dime more than that covers the total cost for labor, fuel and machinery for digging 2240 pounds of high-grade Bessemer iron ore from the ground and putting it in the railroad cars. There are other costs in connection with the operation of the mines which bring this price up to perhaps 25 cents per ton, but there is more than one Mesabi mine which can put ore on the cars for 25 cents per ton, and the name of those properties which can do the work for 50 cents per ton, or less, is legion.

"Against this simple matter of running a big steam shovel into an open cut and loading perhaps 8000 tons of ore in one day with a single crew, the Edison process calls for power drills and dynamite at the start, a steam shovel next, the handling of the ore repeatedly, its crushing to the fineness of sand, briquetting, drying, and other processes which, even when carried on with the notable economy to be seen at the Edison plant, place the latter at a terrible disadvantage, especially when it is necessary to mine, crush and assort three tons of low-grade ore for every ton of finished briquettes sent to the furnace."

Hult's Rotary Engine.

A rotary engine built by Hult Bros. of Stockholm was awarded a gold medal at the recent exhibition at Stockholm, Sweden. The report of its daily performance is that the engine gives entire satisfaction. During a trial of two hours, forty minutes, the consumption of steam worked out to forty-eight pounds per brake horse-power per hour, which is a good result for a rotary engine.

The engine herewith illustrated is a double one; it has two cylinders, which receive steam alternately, like the cylinders of a locomotive, and hence it has no dead point, the turning effort being fairly constant all around the circle. A most noticeable feature is the great reduction of friction, due to the fact that the cylinder can rotate as well as the piston within it. Heretofore in rotary engines it has been customary to pack the edges of the piston or shutter, and let them rub along the surfaces of the cylinder. In this engine the piston is a roller, and the cylinder is likewise free to roll, the two moving at the same circumferential speed, but not at the same angular velocity, since the cylinder is of greater diameter than the piston. Of course, as in all rotary engines, the piston must make contact with the cylinder at two points, and the second must have a sliding contact. But as the cylinder and the piston are both moving in the same direction at nearly the same velocity, the work lost in friction is not great.

The arrangement of piston and cylinder necessitates large bearings. The friction of these, however, is kept down by the use of roller bearings, the rollers being slightly elastic to take up the wear. There are two such bearings at each end of the engine, one for the cylinder and one for the piston.

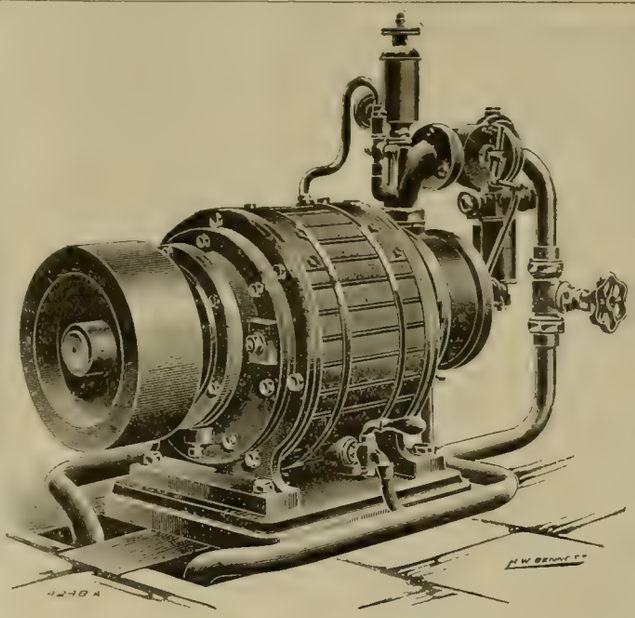

FIG. 1.

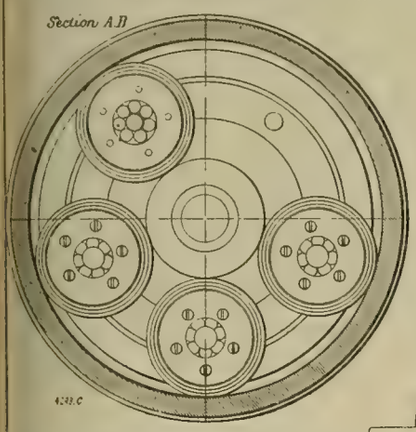

FIG. 3.

Figs. 2 and 6 are sections at right angles to each other of a twin engine. The steam enters at the right hand of Fig. 2, as shown, and finds its way into the central tube, in which there are ports (Fig. 6). It then passes through the passage 2, and exerts a pressure on the shutter protruding from the rolling piston. It will be seen that the upper straight passage has just opened to the steam, while the lower passage 2, which relates to the second engine, has been closed for some time, and that the steam is now expanding in that engine. The two curved passages each communicate with the exhaust, which escapes around the rotating cylinder. It will be understood that each rotating piston runs in contact with the cylinder, and that the latter also rotates. Of course they run on different centers, and the point of contact always remains at the top, as shown. This forms one closed joint and the shutter the other, the expansion of the steam taking place between them.

The rotating pistons each run at one end against the end of the cylinder, and at the other extremity against a loose plate. There are two of these plates in the middle of the cylinder (Fig. 2), and they can be forced apart to take up wear, by pressing wedged-shaped pieces between them by means of screws, as shown. Each piston is, therefore, made steam-tight by rubbing contact over the whole of its ends, while at one part of its periphery it makes a rolling contact with the cylinder, and at another part—the shutter—a rubbing contact which has relatively a very slow motion, since it and the cylinder are moving in the same direction, at slightly different speeds. It will be noticed that Fig. 6 shows a broken section, the right-hand half showing one engine and the left-hand half the other.

The points of cut-off can be varied by rotating the inner tube by aid of the handle shown to the right of Fig. 2. This has the effect of causing the port to be closed earlier or later by the rotating central piece 1. It is by this latter piece the stoppage and reversal of the engine is effected, this operation being performed by the reversing lever shown. When this lever is in the mid-position the tubular piece 1 will shut off the steam channel 2, so that no steam enters the cylinder and the engine is stopped. If the lever be moved to the other end of the segment, the piece 1 will be further turned so that the channel 2 becomes the outlet for the steam, and the channel 3, which previously was the outlet, becomes the inlet. In this manner the engine is reversed. The connection between the reversing lever and the tube 1 is not very clearly shown in the engraving, but it will be seen that there is a link at the bottom of the machine, with a lever passing through the frame at the left-hand end, and operating a rod passing through the central shaft.

There are five sets of roller bearings in the engine, two for the rotating pistons, two for the cylinder, and one at the end where the power is taken off. The piston bearings (Fig. 5) have each a movable roller path, which can be centered by means of screws to bring the pistons into the proper position to bearupon the cylinder. These bearings are on the outsides of the frame (Fig. 2). The cylinder bearings (Fig. 4) have each eleven rollers, and are inside the frame. The remaining set of rollers form both a bearing and a transmission gear, for reducing the speed of revolution. The five rollers run on pins (Fig. 2) projecting from a disk or face-plate (Fig. 3) at the end of the shaft to be driven, each roller having a set of rollers in its eye.

The Primary Gold Deposits of the Sierra Nevada.*

By WALDEMAR LINDGREN.

The gold deposits of California extend through the whole State along a north-northwesterly direction, forming a fairly continuous chain. Beginning in the peninsula range south of the Mexican boundary, the deposits continue somewhat irregularly up to Fresno and Mariposa counties. From here northward the gold belt rapidly widens and in latitude 40° extends from the great valley on the west to the summit of the Sierra Nevada on the east. Interrupted for a short distance by a projecting mass of the great lava fields of northern California, the gold belt appears again in Shasta, Trinity and Siskiyou counties and its northerly end reaches the Pacific ocean in Del Norte county, California, and in Jackson, Josephine and Curry counties, Oregon. Volcanic flows and more recent superjacent formations cover the possible extension of the gold belt towards the east and north.

A smaller auriferous belt of less importance follows the eastern slope of the Sierra Nevada, beginning in Alpine county and continuing southward through Mono, Inyo, eastern San Bernardino and San Diego counties. These deposits, less carefully studied and developed than those of the main belt, usually carry, besides gold, a considerable amount of silver. Associated with these are often also deposits of argentiferous galena and of pure, rich silver sulphides.

Many of the deposits in the eastern belt are of comparatively late origin, proved by their occurrence in tertiary andesite or rhyolite.

In the western belt, almost all of the deposits are on good grounds considered of late zurassic or early cretaceous age.

Along the western slope of the range the gold deposits are closely connected with the more or less metamorphosed zurassic, triassic or carboniferous sediments and associated eruptives and may occur in a great variety of rocks. They are absent or sparingly represented in the main granitic areas occupying so much space in the Sierra Nevada.

The contact of the two formations is not characterized by especially rich or abundant gold ores.

This relation is emphasized by the often remarkable change in the old and recent river channels when crossing this contact line. In the granitic rocks they are nearly barren, but rapidly become auriferous when reaching the metamorphic series. Thus, for instance, there are many old river channels in the granitic areas of upper Placer and El Dorado counties, but they are rarely rich enough to work. Along the eastern base of the range a still wider diversity in the occurrence of gold deposits is noted. They occur here with equal frequency in the sedimentary series (probably largely carboniferous), in granitic rocks and in late andesites and rhyolites. Quartz veins in the large granite areas are of frequent occurrence along this belt.

The western belt is characterized by eminently free-milling ores. Below the zone of surface oxidation 60 to 90 per cent of the total gold value is present as native gold, and this relation does not change whatever depth may be attained. Exceptions to this rule are of course found, as in certain veins in Shasta county, etc. In the eastern belt the quantity of free gold is usually less, and below the water level—that is, below the zone of oxidation—the principal value of the ore is more often in the sulphides than in the free gold. It should also be remembered that in the desert region the zone of oxidation extends much deeper than on the comparatively moist western slope where the water level frequently is less than 100 feet below the surface. That the deposits of the eastern belt also contain much silver has already been noted. On the whole, the gold deposits along the eastern part of the range are very similar to the majority of gold veins of Nevada, Idaho and Utah, while those of the western slope find a less illustrious, if older, counterpart in the Appalachian mountains on the opposite shore of the continent.

The following is a preliminary list of minerals occurring in the gold deposits of California:

Gangue Minerals from Vein Filling and Altered Country Rock.—Quartz, universally present; chalcedonite, fairly common; opal, fairly common; calcite, very common; dolomite, very common; magnesite, fairly common; siderite, fairly common; chromite, (?); magnetite, probably secondary; ilmenite, rare; octahedrite, rare; barite, rare; scheelite, rare (Grass Valley?); turmaline, Meadow Lake, Nevada Co.; albite, El Dorado Co., Calaveras Co.; sericite, almost universal; muscovite, common; mariposite, common; roscoelite, rare; talc, occasionally present; chlorite, rare; epidote, Meadow Lake, Nevada Co.; rhodonite, Plumas Co.

Ore Minerals from Vein Filling and Altered Country Rock.—Gold, universally present; electrum, Bodie, Mono Co.; silver, Bodie, Mono Co.; amalgam, rare; pyrite, universally present; pyrrhotite, comparatively rare; chalcopyrite, common; zincblende, common; galena, common; arsenopyrite, common; chalcosite, Plumas Co.; bornite, Plumas Co. and Mono Co.; molybdenite, common; cinnabar, rare; cobaltite, Tioga, Mono Co.; argentite, Mono Co.; proustite, Mono Co.; pyrargyrite, Mono Co.; stephanite, Mono Co.; polybasite, Mono Co.; stromeyerite, Mono Co.; enargite, Alpine Co.; sulphantimonides of lead (not determined), Calaveras, Tuolumne Co.; tetrahedrite, fairly common; tetradymite, rare; altaite, rare; hessite, rare; petzite, rare; calaverite, rare; melonite, rare; cuprite, Meadow Lake, Nevada Co.; chrysocolla, product of oxidation; malachite, product of oxidation; azurite, product of oxidation; hydroxides of manganese and iron, product of oxidation; erythrite, Josephine mine, Mariposa Co.

Classification.—The deposits may conveniently be divided in: Ore chiefly filling cavities—(1) normal fissure veins; (2) crushed zones; (3) joint seams; (4) gash veins and interbedded veins. Ore chiefly altered country rock—(5) metasomatic deposits.

It should be remarked at the outset that this division is not strictly logical, as metasomatic phenomena may and usually do accompany divisions 1, 2, 3 and 4.

This division includes the great majority of producing veins. These deposits occur along fault fissures, which are approximate planes or slightly curved surfaces. The direction and dip may be in any direction, though in slaty rocks it is common to find the strike parallel to the slaty cleavage or to the plane of sedimentation. The dip nearly always differs from that of the enclosing rocks. The ore consists of quartz (with minor quantities of other gangue minerals), containing disseminated free gold and various sulphides (more rarely arsenides, antimonides and tellurides). The country rock adjacent to the vein is usually considerably changed, and in some cases so much so as to be scarcely recognizable, but the division line between it and the pure quartz is nearly always distinct. The country rock next to the vein contains pyrite, arsenopyrite, white mica (sericite), carbonates and small quantities of gold and silver; rarely so much, however, that it can be profitably extracted as an ore. Small seams of rich quartz may, however, permeate it.

As "unusual types" may be segregated a few veins with predominant calcite or barite filling. Both may contain free gold. Still more unusual is the Meadow Lake type, carrying epidote and turmaline, with but little free gold.

In the crushed zones form of deposit there is, instead of a regular vein, a system of branching veinlets and seams following a general direction, but without much regularity in detail. The value of the ore is in the gold contained in the seams and veinlets. The deposit is usually surrounded by a zone of alteration, a few inches or a few feet in width. The whole mass of seams and country rock is usually mined and milled. As an example of this type may serve the Spanish mine in Nevada county. It is hardly necessary to state that this type is closely related to the normal fissure vein, and that all transitions may be found.

Gold quartz is not uncommonly found along joint seams and systems of joint seams traversing the rocks. They consist of a great number of small fissures or cracks, approximately parallel; each individual seam is only continuous for short distances along its strike and dip. The thickness of the quartz along each seam is usually only the fraction of an inch, but it may contain a very large quantity of gold, comparatively. Often there are two systems of gold-bearing seams crossing each other at a certain angle.

The country rock may be slightly altered, but the value of the deposits lies exclusively in the narrow quartz seams. Such seam systems often occur near important vein systems. The joint seams are closely related to the normal fissure veins and, in fact, grade over into them by the prominence and persistence of particular seams.

As examples may serve the seam diggings N.W. of Georgetown, El Dorado county, and Red Hill, one mile west of Nevada City.

Gash veins are deposits filling fissures of generally irregular form and short lateral and vertical extension, supposed to have their origin in tensile stresses. No faulting has thus taken place along them.

Interbedded veins are deposits filling openings between strata and strictly parallel to them. Such openings would most readily be caused by plication and are naturally limited in their extent.

It is clear that these forms of fissures would be likely to accompany any strongly compressive movement such as is believed to have caused the normal fissure veins, and they have in fact often been noted on a small scale by the writer, especially in slaty rocks. Still, it would be difficult to name any one deposit of economic value along the Sierra Nevada which undoubtedly belongs to either of these classes. It is evident that, according to the classification here adopted, a vein filling a distinct fault fissure, though parallel to the dip of the schistosity or the strata, would not be considered as an interbedded vein.

In the purely metasomatic deposits there is no clearly defined fissure or seam systems along which the ore is found. On the contrary, they consist of an irregular zone of intensely altered rock which contains gold and silver and forms the ore.

To this type belong certain deposits in andesite along the eastern slope of the range scattered from Nevada to Alpine county, and most abundant in the latter. The Oro Fino mine, El Dorado Co., and many deposits in Shasta Co. offer other examples, but on the western slope it is not a usual type.

The metasomatic ores generally contain much silver, besides gold.

As stated above, metasomatic ores may be found adjacent to any fissure veins, though they are rarely of high grade. On the other hand, seams and veinlets may be found in even the most typical metasomatic deposits, indicating that there is no well defined line between the two classes.

Origin of Gold Deposits.—The careful investigations thus far made lead to the conclusion that normal fissure veins, crushed zones and joint systems are caused by compressive stress. By examining a number of mining districts it has been found that the arrangement, dip and strike of the fissures correspond, more or less exactly, to the calculated results of compressive stress applied to a homogeneous material. Thus, one of the most common conditions is that of a series of veins parallel in strike, but with dips in opposite directions, forming a "conjugated system" of fractures.

It has further been shown that no sharp line can be drawn between large and small fault fissures. The joint seams (sheeted zones), so commonly found, consist simply of a number of very small fault fissures.

All fissures are limited in lateral and vertical extent; but some go down much farther than others.

The white and milky normal vein quartz is, beyond all reasonable doubt, a vein filling deposited in open spaces by hot mineral water containing silica. This has been fully discussed and explained in many recent publications. When the quartz is flinty, greyish or greenish, cellular and showing evidence of pseudomorphic deposition, further investigation is necessary to determine its origin.

The solution depositing the quartz contained, besides silica, a high percentage of alkaline carbonates in which gold and sulphide ores are soluble. From these supersaturated solutions silica was deposited by reason of slight variations of physical or chemical conditions, and with the silica much of the gold was probably mechanically deposited. In the same manner the soluble sulphides crystallized out, and with them, according to well-known laws of affinity, also much gold.

During late years the importance of metasomatic processes for the theory of formation of mineral deposits has been fully recognized. But as often is the case, some of the champions of this mode of origin have applied it indiscriminately to everything, not fully realizing the character of the process involved.

Metamorphism means the conversion of one rock into another of different structure, texture or mineral composition, or all these, while its composition remains approximately the same—limestone to marble, clay slate to mica schist, etc.

Metasomatism means the conversion of one rock or of an aggregate of minerals into another of wholly different chemical composition. The form, structure and texture of the original rock or mineral may also be wholly changed. (Pseudomorphs of minerals may result from metasomatic action, but in pseudomorphs the original crystal form of the mineral is preserved.)

As examples may be cited the conversion of calcite into galena, known from many deposits in limestone. Metasomatic action, however, rarely involves a complete change. In many cases one or more of the elements in the original mineral is retained in the new combination; in a rock some of the minerals may be wholly or partly changed by metasomatic processes, while others are not affected.

Substitution and *replacement* are terms used by some writers (the author included) as the exact equivalent of metasomatism, while others have used *replacement* to indicate a complete metasomatism, as galena from calcite, and *substitution* to denote a partial metasomatism, as calcite and pyrite formed from hornblende.

Chemical action generally takes place between the solvent and the original body. Metasomatism by simple dissolving and deposition *paripassu* is also possible.

Cementation, which must be strictly distinguished from metasomatism, consists in the filling of cavities, or, in general, interstitial space, by deposition from solutions. Chemical action is not involved here. As example may be cited deposition of silica in sandstone, tuff and other porous rocks, this kind of silification being often noted near veins in such rocks; further, the filling of an extensively crushed rock mass by quartz deposited in cracks and seams.

From the definitions it is clear that the intensity of metasomatic action depends on the intensity of chemical action between solvent and body acted upon. Thus easily soluble rocks like limestone will easily fall a prey to metasomatism, while silicates are much more resistant. Coarse and basic rocks (diabase,

*Stanford Journal.

gabbro, serpentine, etc.,) will be more easily affected by mineral solutions usually occurring in nature than fine-grained and silicious substances.

The processes to which sedimentary and igneous rocks close to the veins have been subjected result in the formation of white micas (sericite, more rarely mariposite or roscoelite,) carbonates of calcium, magnesium and iron, together with pyrite or occasionally arsenopyrite, all these minerals replacing the feldspars and the ferro-magnesian silicates, and to a less extent the quartz. It is therefore a partial metasomatism. Any one of the resulting minerals may locally preponderate. In certain rocks like diabasic or serpentine the carbonates form especially abundantly and easily, and by this process large masses of dolomitic vein material may result. The "dolomite," near the mother lode, is believed to have resulted in this manner. Very characteristic for this process is the elimination of sodium from the rocks and the accumulation of potassium chiefly contained in the white mica or sericite. Kaolin is a comparatively rare product, the white "talcose" masses generally regarded as kaolin or talc being, as a rule, composed of finely divided sericite. This *sericitization* seems characteristic not only of the gold quartz veins of the Sierra Nevada, but also of many recently investigated districts in Idaho and Colorado.

A silicification by metasomatic processes is only recognized to a very limited extent. On the contrary, silica has generally been extracted from the wall rock and deposited in the open spaces. Indeed, the tendency of the silica to deposit in open spaces, if such exist, is quite remarkable. Replacement of silicates by silica, wherever recognized, is characterized by fine-grained and crypto-crystalline aggregates. It is generally very easy to recognize a silicified rock, for it never has the characteristic coarsely crystalline structure of that deposited in open cavities. When the "vein stuff" consists of carbonates it behooves one to be very careful in its classification as filling or metasomatic product, for carbonatization easily takes place and may change the original character of the rock to an amazing degree.

In purely metasomatic deposits the changes involved are similar to those just described, but in the absence of open spaces the silica is often deposited within the rock, usually forming jaspery and flinty masses mixed with the remainder of other minerals. Streaks of "talcose slates" forming low-grade ore bodies have been noted from various parts of the western slope. Some of these, such as the Boss mine, near Sweetland, Nevada county, are simply sericitized schists filled with pyrite. The latter contains some gold which is set free in the surface zone of oxidation. Other deposits of this kind appear to be true talc schists, and Turner describes one from Mariposa county containing, besides talc, dolomite, free gold, auriferous pyrite and itmenite. Such a deposit must be characterized as very unusual.

As noted above, the metasomatic wall rock has, in the case of fissure veins, rarely absorbed a very large percentage of gold and silver, so that its economic value is not great unless containing many quartz seams rich in gold. From investigations thus far made it appears that the permeability of these altered wall rocks is greater for silver than for gold. For while it is exceedingly common to find silver ores, economically valuable, result from the alteration of the country rock, both near veins and near limestone deposits, by far the largest percentage of gold ores occur as pure filling of cavities.

The character of the processes here outlined depended in the first place on the composition of the thermal waters causing the deposit, and as that composition varied so will the products of metasomatic action. The great similarity in the alteration in gold deposits show that their thermal waters must have had a very similar composition.

In deposits varying greatly from those here described a different series of metasomatic products will probably be found. Much remains to be done in this line of investigation. The exact process of alteration in the great thermal zones of Alpine county and adjacent parts of Nevada, for instance, offer an attractive field for research.

W. A. FARISH, who returned recently from Honduras, says he had a hard time of it there. "Sometimes we were wading in swamps twenty-four hours at a time, and from first to last it was one of the most disagreeable trips that can be imagined. The mines that I went to examine are on the west side of the range, and were worked by the Spaniards from the discovery of the country until they were driven out in 1821. Since then there has been very little done, and the old workings still remain there. The mines were very largely worked by open cuts, and these stand up sometimes over 100 feet. One reason why nothing has been done is that there has not been the requisite capital. A native company undertook to cut the workings of one of these old mines and ran a tunnel of nearly 2000 feet, only to find that they were still above the lower workings. The pillars of ore were taken out and shipped to San Francisco, and enough was realized from the sale of the ore to pay all the expenses of running the tunnel with a very handsome margin for profit. This gives some idea of what may be done with proper development in accordance with modern ideas. The gold belt in that country is about a mile and a half wide, and traverses the entire country. The country rock is andesite porphyry, and there is no reason why it should not pay handsomely when operated systematically and economically."

The Witwatersrand Banket, With Notes on Other Gold-Bearing Pudding Stones.*

NUMBER VII.

By GEO. F. BECKER.

If the solutions rose through "rake veins," they would permeate all accessible permeable strata and partings. Now, it seems to be generally assumed that a conglomerate without matrix would be much more permeable to fluids than a sandstone. This is true if only rapid currents, such as might be impeded by fluid friction, are to be considered. There is no probability, however, that ores are deposited from rapid currents. For slow currents fluid friction is a vanishing quantity, and then the permeability of a given rock may be considered as measured by the interstitial space. Now, the interstitial space in a conglomerate composed of pebbles of various sizes is really less per cubic foot than that of a fine but even-grained sandstone. If the material is of absolutely uniform grain, the interstitial space is wholly independent of the size of the component particles, and cannot fall below 26 per cent. It is a fact well known to millmen that a cubic foot of sized tailings weighs less than a cubic foot of unsized tailings. Sandstones used for building in some cases contain over 20 per cent of voids, and highly indurated sandstones contain 4 or 5 per cent.

It follows, then, that the sandstones as well as the conglomerates should have been impregnated when soaked in an auriferous solution, and to approximately an equal extent, while as a fact the sandstone does not contain one one-thousandth part of the gold. The impregnation theory would, furthermore, seem to involve the presence and the prevalence of chutes in the banket. There is no doubt that most of the gold occurs in patches which are distinctly different from chutes, and many engineers are confident that real chutes are absent. Much of the pyrite is in the form of minute water-worn pebbles, and much of the gold is inclosed in the pyrite, indicating a common origin for the two minerals. This fact is regarded by De Launey as fatal to the impregnation theory, and, indeed, it seems impossible to reconcile this mode of occurrence with the hypothesis.

The strength of the impregnation theory lies in the fact that some of the gold and of the pyrite appears to be crystallized, as if deposited in place. A portion of the observed phenomena seem certainly secondary. Below water level, or "in the blue," visible gold is very rare on the Rand. In the oxidized upper levels it was much more frequent, and free gold was found in the cavities from which pyrite had disappeared by oxidation. This is, of course, a very common phenomenon at the croppings of auriferous deposits, and can be accounted for only by the recrystallization of gold attending the oxidation of pyrite. The modus operandi is also pretty clear. Iron sulphate is a weak solvent for gold, and iron sulphate is one of the products of decomposition of pyrite. Recrystallization is a process which goes on in the presence of weak solvents. Recrystallization of rock components is a very common thing, and the ordinary phenomenon called metamorphism is substantially recrystallization. The quartzite walls of the Main Reef are in part recrystallized sandstones, and recrystallization of silica has certainly taken place in the banket. Some recrystallization of gold and pyrite in the blue may very probably have occurred as an incident to general metamorphism or to the formation of the white veins. Hence the impregnation theory is not the only one which will account for the state of one portion of the gold and pyrite, and the fact that it could explain this state is insufficient to outweigh the many objections to the theory.

On the whole, then, it appears to me that this theory is untenable. It is popular with engineers accustomed to quartz veins, partly because it involves a close analogy between the Rand deposits and the more familiar type of gold deposit.

Precipitation Theory.—The theory maintained by Mr. De Launay in his latest work is that the sea in which the banket was deposited was a saturated solution of gold and pyrite. These minerals were precipitated as the banket accumulated, a part of the pyrite being at the same time waterworn. This theory is an elaboration of Mr. Penning's. It avoids some of the objections to the impregnation hypothesis. The absence of rake veins and well-marked chutes is consistent with the scheme of Messrs. Penning and De Launay, and it would account fairly well for the patchiness of the reefs. Mr. Penning was driven to it by the angularity of the gold; Mr. De Launay, by the supposed importance of the rarity of gold in the pebbles.

The precipitation theory, however, is by no means free from objections, chief of which is that it gives no account of the most important feature of the deposits, namely, the association of gold in largest quantity with the coarsest banket. One would expect to find the sands at least as much mingled with the auriferous precipitate as the banket. Precipitates are usually thrown down in a fine state of division. How is it, then, that the currents which swept away all mud and fine sand did not also carry off the crystals of gold and pyrite before they had time to reach considerable dimensions?

Mr. De Launay supposes a relatively quiet deposition of gold and pyrite from sea water in unsorted material, followed by a natural concentration. Now, sorting begins the moment that detritus from the land reaches the sea. I perceive no opportunity for the supposed quiet precipitation of gold and pyrite; nor do I understand why precipitation, if it takes place at all, does not continue during the sorting process, so that the sands eliminated from the pebbly material would continue to be enriched by precipitation.

The fundamental hypothesis of a sea highly charged with gold and pyrite seems to me extremely improbable. Had the ocean at any time been so charged, the mineral would, as Mr. De Launay says, be precipitated with extreme ease. How, then, could the ocean become highly charged? It would seem that the gold and pyrite going into solution, say at the mouth of some submarine solfataric vent, must be thrown down almost immediately and close to the point at which solution took place. An almost uniform distribution of gold along a coast known to be at least thirty miles in length would then be impossible. Again, if the ocean ever was so powerful a solvent for gold, why are there not many and indubitable cases of deposits formed by this method?

The advantages of the precipitation theory over the simple detrital theory are, as I understand Mr. De Launay, that the former hypothesis explains why there is no gold or pyrite in the pebbles and why the gold is not substantially all on the foot wall of the reefs. These advantages are by no means substantial ones, as will presently appear.

Marine Placer Theory.—As has been noted above, pebbles which carry crystallized pyrite and other sulphurets disseminated through the quartz, and not on fissures of any sort, are fairly abundant on the Rand. Gold is also known in the pebbles. Some writers consider it very strange that if the pebbles came from auriferous quartz veins gold-bearing pebbles are not more abundant. As a matter of fact, in the auriferous river gravels of California and Venezuela pebbles showing visible gold are extremely rare. Even in the vast exposures of the hydraulic washings one might spend weeks in the vain search for a specimen. In the sluices, however, small pieces of auriferous quartz may be found with the gold, separated by the concentration process from thousands of tons of barren pebble. On the auriferous beaches of California, Oregon and Alaska such pebbles seem to be still rarer than in the river gravels. Thus the rarity of gold-bearing pebbles on the Rand is such as should be expected from analogy if the deposits belong to the class of deposits.

The presence of crystallized gold and pyrite is by no means unaccountable on the same theory. Even in the Tertiary gravels of California recrystallization of sulphurets is now in progress, and it is probable that recrystallization of gold also has taken place to some extent. On the Rand it is certain that solutions capable of dissolving gold to some extent have been present below water level at some time since the original deposition. These accompanied the formation of the white quartz veins which cut the banket beds and which occasionally carry a little gold. The same solutions must have been capable of dissolving pyrite. The solvent fluids were probably hot waters containing sulphides of the alkalies and carbonates. Such waters dissolve gold and sulphurets, and they almost invariably accompany eruptive activity such as is manifested in the dikes of the Rand. Now, recrystallization being due to the action of fluids which exercise a feeble solvent power, it would be extremely remarkable (taking the existence of the white veins into consideration) if the gold and pyrite of the banket showed no evidences of recrystallization. It is quite as easy to account for recrystallization of the gold and the pyrite as for the conversion of the sandstone into quartzite.

The objection to the theory under consideration that the gold is not uniformly found on the foot wall of the reef is entirely without weight. In auriferous *river* gravels, indeed, most of the gold is found either on bed rock or on layers of pipeclay; but the banket is not a river deposit. As has been explained already, river gravels are distinguishable both by the form of the pebbles and by their imbrication or "shingling" from marine gravels, to which class those of the Rand belong. The deposits are, therefore, comparable with the auriferous beach deposits of the Pacific coast or New Zealand, and not with the river gravels of the Sierra Nevada. In the beach gravels the gold is found at the bottom of the layer of material set in motion by the last wave or current by which the mass has been agitated. Hence the beach deposits consist of stratified masses of gravel and sand, in which the gold is for the most part confined to those layers which are composed of heavy particles.

Wingdams.

Written for the MINING AND SCIENTIFIC PRESS by R. L. DUNN.

River bed mining for gold by what are called "wingdams" is a method of placer gold mining in common use in California. It is employed in mining the water covered beds of large rivers where it is impracticable or undesirable to divert the water from the entire bed. A wingdam is a dam which extends out from one side of a river part way across the stream, crowding the full flow to the unobstructed side. It usually is built out about half way across then turned down stream and parallel to the bank till it includes within it the portion of the river bed it is intended to mine, then, turning toward the bank of the river it started from, it completes the enclosure tight against inflow from the river. The dam is usually temporary in character, intended for a season's use only during the low water season. Only so much ground is included as it is estimated can be worked out before the rising waters of the wet season overwhelm and tear out the dam. Construction and operation generally proceed as follows: After the high water of spring subsides and as early in the dry season as possible, the work is commenced by the construction of the head wingdam. This is located at the upper end of a riffle in shallow water. Two parallel walls of large rocks or cobbles are built out from the shore from 6 to 8 feet apart and the inner space between filled in with gravel, sand and clay. The filling is made as near as practicable water tight and the walls so constructed as to protect the filling from the wash of the current. At the middle of the stream the walls are turned down stream and with the filling continued parallel to the shore till the desired area is enclosed, then the walls turned again are built to the shore, making the tail dam. This last dam is located on a riffle, if convenient. This is the simplest form of wingdam construction. In rivers with strong currents and large flow of water, cribbing is sometimes employed to strengthen the head and mid-stream dams and the latter are faced with inch plank as a protection against the stream wash. The mid-stream dam in particular requires attention as the confining of the stream to half of its width materially increases its velocity and consequent eroding energy. The enclosed area of the dam is full of water which is cleared together with sipage water by pumps. In the simplest form of construction the power for pumping is obtained from a current wheel operated by the river flow. The diameter of such a wheel is from 10 to 14 feet and its length of paddles 8 to 20 feet. The shaft is a single stick of square timber 12 to 16 inches square. The ends are rounded and protected by iron rings. Into the ends are set 2½ to 3-inch gudgeons on which the shaft turns in oak boxes set on movable pillow blocks so that the wheel can be raised or lowered by levers to meet the natural variations in the stream flow. The wheel is set outside the mid-stream dam so that the current impinges directly on the buckets where necessary a wingdam being built out from the opposite side of the river to direct the current. The wheel is set at the lower end of the enclosed area. Between the wheel and the inside pillow block is a wooden drum about 3 feet in diameter. From this wood pulley a wide belt transfers the power to the pump shaft, a square timber of similar size to the wheel shaft. The pump shaft actuates what is known as a Chinese pump. This is an inclined box made of 1½-inch lumber, 16 to 30 feet long. Through this box runs a belt, 12 to 24 inches wide, according to the water it is required to handle. Fast to this belt are paddles 3 to 6 inches deep, but all alike and with the belt just filling the box. On the pump shaft is a wood pulley and fast at the lower end of the box a second wood pulley. Over these two the belt is carried and through the box. Applying the power from the water wheel a continuous stream is lifted through the box and discharged by a box over the dam. Such a pump will lift considerable volumes of water from 12 to 20 feet and they have been successfully worked to a lift of 30 feet. This style of pump is the simplest and cheapest for the work and two or more can be operated in the same mine should one prove insufficient. In place of it there can be employed centrifugal or steam pumps or hydraulic elevators and water lifts. The circumstances of each particular operation would determine whether or not the employment of any one of these substitutes is economical. Generally speaking none of them are economical. With the pump in place the mining proper commences. The water is pumped out. A sump is commenced at the lower end of the pump so that the drainage of the entire area comes to it. Including the sump is commenced the excavation of a pit to the bedrock though the loose sand and gravel of the exposed river bed. The ordinary placer mining methods are followed from now on, the exposed river bed being a placer with deficient dump and subject to the condition of pumping to admit of working.

CAMP NO. 2 S. & L. B. T. CO.

TRACK LAYING.

PIECE OF COMPLETED TRACK.

Improving Klondike Transportation.

As was to be expected, the rush to Klondike and the Yukon region has stimulated unusual activity in overland transportation facilities. A year ago there was very little in that direction, but now ingenuity is taxed in devices for getting up there quicker and easier. Two wire rope tramways are in course of construction, railroads are projected, and if half of what is said is to be given serious consideration, in another year it will be as easy to ride to Klondike as it is in many regions that have be settled for a quarter of a century. Among the many projects for carrying freight and passengers devised by those who rightly judge that there is as much present money in the carrying trade as there is in getting out gold is the Skaguay & Lake Bennett Tramway Company, which is building a pole tramway from Skaguay to the international boundary and thence to Lake Bennett. The company's officials say that they can build it for about one-fourth what a narrow gauge road would cost; that its carrying capacity will be about one-third of a narrow gauge road and about twelve times that of a wagon road, and that when completed they can carry freight from Skaguay to Lake Bennett in twelve hours. The accompanying engravings give a good idea of the appearance of the country, progress of the road, etc. Another pole tramway is being built around White Horse rapids—that short but dangerous piece of water on the route down the Yukon.

Experimental Slimes Plant.

The South African *Mining Journal* describes a small plant of the Clancy and Russel process for the treatment of slimes, which consists of two superimposed buoy-shaped conical vats of 300 gallons capacity each, capable of treating about four tons of slimes per twenty-four hours. The slimes, which have been experimented upon, contain about 2 per cent of dried slime. This particular treatment is based on the quality of the content introduced and mixed with the slimes, so that a 4 per cent quantity of slime pulp could as easily be treated as that which is now being supplied.

The prominent feature of the plant is that pulp is

introduced at the bottom of the inverted cone-shaped tank, with sufficient head of pressure regulated to ensure a gentle flow into the vat. The slimes pulp being introduced under the head of water prevents the slimes from rising, and to obtain an equal distribution a bell-shaped distributor is fixed inside the vats over the intake pipe. The excess water flows away from the top of the vat in a clarified condition, and can be returned to the battery for use. An internal launder regulates the steady flow of the excess water from the vat to the discharge pipe, preventing any unequal draught in the discharge current. The separated or concentrated slimes are drawn from the bottom of the cone and forced up three feet of discharge pipe. They are then run into a mixing chamber, built between the two vats, and into which a weak cyanide solution is turned, so that the slimes and solution come into equal contact at one end of the chamber. The mixture is then agitated by compressed air, introduced in the middle of the chamber. The present contact is of about fifteen minutes' duration, but can be regulated by the size of the chamber. The mixture is then run into the lower tank, again from the bottom of the inverted cone, and the operation of separation repeated. The solution is then run off into boxes for treatment in the ordinary manner, and the residues discharged to the waste dump. The slimes now being treated are of 3½ dwt. value, and the extraction claimed is 81 per cent, the washed residues only containing 16 grains. The process can be worked almost automatically, the local estimates for a plant capable of dealing with 150 tons of slimes per diem being about $30,000.

Fatigue of Metals.

Two years ago it was announced at a meeting of the American Institute of Mining Engineers that cast iron when subjected to long and continued shocks or vibrations increased in strength, the explanation being given that the gain in strength is due to the release of internal cooling strains, owing to a rearrangement of the molecules under the influence of shock. This is, in effect, a process of mechanical annealing analogous to annealing by heat. Upon a testing machine over 1000 test bars were broken, one-half of which had been subjected to shocks or vibrations in a revolving iron barrel; the other bars, cast in the same molds and from the same metal, were not so treated. In all cases the bars that had been subjected to shock were found to be stronger than their companions, the average being over 10 per cent, and the maximum gain, as shown in the published tables, being nearly 20 per cent. This statement excited wide notice in this country and Europe. The tests were repeated by expert iron masters everywhere, and the experiments subsequently published by many observers not only corroborated the original statements, but the records of these independent investigations in most cases far exceeded the original claims.

The Franklin Institute committee made a great number of tests, showing large gains in most cases, and the maximum gain in strength exceeded that of the original record by more than 100 per cent. The investigations of the committee extended over a period of more than a year, and no evidence was offered, or found after prolonged search, indicating that such tests had ever been previously made. On the contrary, these experiments explained for the first time the certain peculiar and heretofore mysterious physical properties of cast iron.

It has long been thought that iron castings improved by age, and over thirty years ago, Sir Frederick Bramwell, then the director of the metallurgical work at Woolwich Arsenal, England, found that some old cast iron guns recently tested by him were immensely stronger than precisely similar guns made and tested within thirty days after having been cast. "Tests to destruction" of both the old and the new guns were then ordered to be made, and it was found that a gun which had been kept for sixty years before being tested endured 800 discharges before it burst; another gun, kept the same length of time, did not burst after having been subjected to 2582 discharges. Sir Frederick Bramwell reported in 1860 that "guns of the same description tried thirty days after casting burst, one at the 84th and one at the 72nd discharge." "This result," said he, "showed that it was not impossible that the superior manner in which guns cast some years ago but recently used stood their work as compared with those of modern make was not due, as was commonly supposed, to the better quality of the metal used in those days, but to their having been cast a long time, and to the strains that existed in them, from unequal contraction when originally cast, having ceased, while the strains in the new guns were exerting a prejudicial effect."

The recent discovery, so fully corroborated by the Committee on Science and Arts of the Franklin Institute, proves the correctness of these assumptions. But it does much more than this. The tests not only measure quantitatively the force and value of these internal strains in cast iron, but the important discovery has been made that such strains can be quickly removed by subjecting castings to shocks or vibrations. Steel and forged iron are inherently different metals, and are differently treated from cast iron in the process of manufacture. It is, therefore, not incomprehensible that the effect of vibration upon steel and iron is to cause "fatigue," and consequent weakening, of the metal. Lord Kelvin thirty years ago directed attention to the fact that iron wires kept in torsional oscillation during the week behaved quite differently after their Sunday's rest, and it has recently been shown that owing to molecular rearrangement which occurs during rest in an overstrained bar the "modulus of elasticity" will rise 10 per cent, after three weeks holiday. This remarkable statement was made by Sir Benjamin Baker in his presidential address two years ago at the meeting of the English Institute of Civil Engineers.

It is naturally to be expected that many facts are still to be learned about the physical qualities of steel, because its application to very large engineering work is of comparatively recent origin; but it was said at the meeting of the mining engineers two years ago that it was long thought that practically all properties of cast iron were known, and that the discovery of a hitherto undetermined law of the physics of cast iron at this late day was, therefore, a complete surprise to the metallurgical world. The Franklin Institute committee in its report says:

"The principal result has been to largely upset some of the generally held ideas on the subject of cast iron, and where formerly it was considered essential that small or light castings must be protected from shock, it is now believed that they may be generally strengthened and relieved of their internal cooling strains by judicious treatment in this way."

Recent specifications for certain castings required to be made of iron of guaranteed strength contain a new clause stipulating that the test bars must not be subjected to shock in a tumbling barrel or otherwise have their strength increased by mechanical vibrations. A practical result of this investigation will be to give increased confidence in the use of cast iron for structural and other purposes where the metal is subject to vibrations of moderate shocks.

Recently Declared Mining Dividends.

Raven, Colorado, 1 cent per share, $10,000; March 1.

Lillie, Colorado, 1 cent per share, $9000; March 1.

Standard, California, 10 cents per share, $30,000; March 1.

Swansea, Utah, 5 cents per share, $5000; payable March 10.

Ruby, Montana, 2 cents per share, $6000; payable March 5.

Personal.

H. C. WOODROW is Supt. Lightner mine, Angels, Cal.

P. ROWE becomes Supt. Bell mine at Tuttletown, Cal.

J. CHESTNUT has returned to Oakland from Tuolumne Co., Cal.

F. P. KING is the new Supt. Blue Gravel hydraulic mine, Yreka, Cal.

W. M. NESBIT becomes Gen. Supt. Grand Central mine, Tintic, Utah.

L. GILSON, owner of mines at Casa Grande, has returned to Nogales, Ariz.

H. SIMONS, Supt. Morning Star mine, Iowa Hill, Cal., is in San Francisco.

J. HILBERT succeeds F. A. Farnum as Supt. Webb M. Co., Brown's valley, Cal.

I. L. MOOR, Gen. Mgr. Lucky Marion mine, Greenwood, Cal., is in San Francisco.

J. MCNAB, interested in Sonora mines, has returned to San Francisco from Arizona.

C. GRACEY, Supt. Southwestern M. Co., El Dorado Canyon, Nev., is at Volcano, Cal.

W. N. NESBIT has been appointed Supt. of the Grand Central mine at Eureka, Utah.

ELMER C. TOWNE, Supt. Commonwealth mine, Rocky Bar, Idaho, is in San Francisco.

CAPT. TAYLOR, Gen. Mgr. Oriental Con. mines, Chemulpo, Corea, is in San Francisco.

D. FRICOT, managing owner of the Independence mine, Grass Valley, Cal, is in San Francisco.

GEO. H. EVANS, Gen. Mgr. Con. California gold mines of Butte Co., has returned from Siskiyou Co.

H. T. SCOTT of the Union Iron Works, San Francisco, left the City of Mexico for Guadalajara, enroute home, Feb. 23d.

M. LA FORGUE, Mgr. Boleo copper mines in Lower California, becomes Mgr. of the Inguaran copper mines in Michoacan.

M. B. KERR of Valley Springs, Cal., will spend this month in a detailed examination of the Gaston Ridge mine, Nevada Co.

J. J. CASE, Ass't Supt. Boston & Montana Co., has resigned to become Supt. of one of the Bigelow Co.'s properties, Houghton, Mich.

RALPH NICHOLS, formerly Supt. Sutro tunnel, writes from Sydney that he is on his return from Coolgardie, Australia, to the United States via South Africa.

GEO. A. BETHUNE, professor of assaying at the Butte School of Mines, Montana, will treat by special process the refractory ores of the Mastodon mines, at Mammoth.

UNDER date of Jan. 6th, Jno. D. McGillivray, late of the MINING AND SCIENTIFIC PRESS, writes from Dawson City, N. W. T. Of the 1200 who left here last summer but 39 got through, of which number he was one. He confirms the conservative views taken by this journal, and offers little encouragement to any one to take the perilous trip.

J. SLOAT FASSETT, ex-Collector of the Port of New York, is in San Francisco superintending the shipment, per City of Peking, of a half million dollars worth of mining machinery for the Chemulpo, Corea, mines which he acquired two years ago as a special concession from the Corean Government. Ten practical millwrights will leave on the steamer Doric on the 12th inst. for Corea to put up the machinery.

Coast Industrial Notes.

—All this present war talk emphasizes the immediate need of the Nicaragua canal.

—The total shipment of oranges from Riverside for the season up to Feb. 26th was 610,779 boxes. This is a greater shipment than was sent out up to the same date last season.

—Property including 1,000,000,000 feet sugar pine on the Klamath river and a sawmill at Klamath, Or., is being bought by F. Carney of Marinette, Wis., J. H. Wilbeck of Chicago, and Messrs. Ducey of Detroit for $1,000,000. San Francisco lawyers are now getting titles in shape for the transaction.

—The Santa Cruz powder works are busy day and night. Four new presses have been received for the manufacture of smokeless powder, an additional output of 4000 pounds of smokeless powder daily. The capacity of the works is now two and a half tons of Government powder daily, and nine tons of black powder.

—A large work now going on is the tunnel of the Great Northern railroad in the Cascade mountains, western Washington. The formation at the east portal is solid rock; on the western end there is much earth interlaid with large boulders. Much progress has already been made at both ends, but, as the total length is to be considerably in excess of 13,000 feet, it is estimated that two years will be required for its completion. The east portal of the tunnel is at an elevation of 3400 feet above sea level, and, as it drops nearly 300 feet in the length, makes a grade of 1.7 per hundred, sloping toward the west; such a grade will furnish drainage and will also provide a draft for smoke.

—The Canadian Pacific and other northern lines announce a big cut in rates, which affects business in two directions. The present rates from the Atlantic seaboard to the North Pacific coast are $79 35 first-class and $67.40 second-class. The Canadian Pacific has made these rates from all points in New England and New York $40 first-class and $30 second-class. Rates to St. Paul are cut from $29.50 first-class and $28.50 second-class to $20 first-class and $19 second-class. The Southern Pacific road has notified all its connections that it will not accept business on the basis of rates made by the North Pacific coast lines. It has all the Alaska business it can handle from its own territory, for which it gets full rates and does not care to endanger this in any way.

—The Los Angeles Iron & Steel Works at Los Angeles, Cal., have been sold to R. H. Herron & Co. The works cost $120,000, and the bonded indebtedness of $30,000 represented the working capital of the concern. The plant is estimated to be worth $75,000 if the works were to be put in operation. R. H. Herron says: "Los Angeles occupies a similar position with her oil for fuel, and it is as cheap as the coal fuel used in Pittsburg. Billets can be landed in Los Angeles in shipload lots from Germany just as cheaply as they can be landed in Pittsburg. Apart, however, from working up the product from billets, the mill offers a market for scrap iron and steel, and heretofore there has been absolutely no demand for such material. In the light of all the facts there is no reason why the mill should not be started up and a very profitable industry carried on that is capable of indefinite expansion." Mr. Herron is negotiating with capitalists with a view to putting the mill in operation.

—G. Toppe, director Imperial Steel Works at Yawatamura, Japan, has been in the United States for two months, inspecting steel plants. He says: "The object of my visit to this country is to study the construction of the largest steel plants, the machinery used, the methods employed and, in general, everything pertaining to the iron and steel industry. Japan is building a large steel plant, and they want to embody the largest and most improved ideas in construction, machinery and methods of work. The Imperial Steel Works, which I represent, are being built by the Japanese government, and is the first steel or iron plant ever constructed in that country. Japan has hitherto been buying all her steel and iron from foreign countries. This steel plant will be situated at Yawatamura, a town of about 10,000 inhabitants, on the extreme northern end of the island of Kushiu. The island is very rich in coal. This industry is almost new, but over 3,000,000 tons of coal are now being taken out yearly. The ore beds from which we will get our supply of iron ore are on the island of Honshiu, which is a mile north of Kushiu. Honshiu is the main island of Japan, and contains Tokio, the capital. The ore will be brought from one island to the other on a ferry boat, thus saving reloading. The works will cost $10,000,000 and will be in operation in about three years. I do not know how many men will be employed, but there will be about thirty skilled mechanics from other countries to serve as heads of various departments. In the beginning the yearly capacity of this plant will be 100,000 tons; but this will be greatly increased later on. The products of this plant will be steel rails for railroads, steel plates for ships, boiler plate, bar and structural iron."

Recent California Mining Incorporations.

Sunrise M. Co. of Alaska; capital stock, $1,000,000, all subscribed; E. D. Bannister, F. Smith, W. A. Farish, C. C. Clark, W. H. Bailey.

Golden Jubilee M. Co.; capital stock, $500,000; subscribed, $352,600; A. L. Emery, C. H. Buck, F. E. Shrober, W. W. McNair.

Tanana M. Co.; capital stock, $5000; subscribed $4250; F. Soule, F. W. Beardslee, G. W. Bunnell, A. T. Heydon, E. H. Stearns.

Seven Sisters G. M. Co., Kennet, Cal.; capital stock $500,000, subscribed $300,000; G. W. King, G. Ferguson, W. V. Hayes, J. R. Lemon, A. R. Hayes.

North Star G. M. Co.; capital stock $100,000, subscribed $19,000; J. Curtis, F. Schilling, F. H. Finke, T. Trask.

Reliance M. Co.; capital stock $10,000,000, subscribed $50,000; J. H. Griswold, S. G. S. Dunbar, E. C. Fennessy, H. E. Snook, H. A. Tubbs.

Sunrise G. M. Co., to operate in Alaska; capital stock, $100,000; subscribed, $18,100; U. G. Heller, W. B. Goodenough, B. Stevens, W. D. Van Sicklen.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING FEBRUARY 22, 1898.

599,600.—GUN TURRETS—G. W. Dickie, S. F.
599,499.—FURNACE—H. S. Carr, Los Angeles, Cal.
599,628.—SHEET METAL PIPE—R. J. Northam, Los Angeles, Cal.
599,574.—BOOK REST—Betsey Sherman, Toledo, Wash.
599,647.—FRUIT DRIER—G. A. & B. G. Steevens, Salem, Or.
599,374.—BAND WHEELS—A. J. West, Aberdeen, Wash.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Commercial Paragraphs.

THE Ibex Mining Co. has ordered the third Jeanesville mining pump.

J. A. STRAITH & Co. of Los Angeles have established a well-equipped assay office at Nogales, Arizona.

GEO. W. KNEASS has a contract for building a 75-foot steamer for the U. S. Coast and Geodetic Survey, to be used in surveying in the Yukon. She will have two compound engines and twin screws, and will cost $12,000.

THE San Francisco Launch Co. is building a stern-wheel steamboat 180 feet long, to the order of the U. S. Government, for patrol duty on the Yukon. W. H. Birch & Co. have the contract for the engines, which must be completed in ninety days and will cost $40,000.

Mining Summary.

CALIFORNIA.

Alpine.

At the Advance and Colorado, north of Monitor, P. Curtz, Gen. Mgr. Monitor Mining Co., has fourteen men opening up the Advance mine, which has been abandoned for twenty-three years. Since November 1st last 1400 feet of the tunnels and drifts have been opened and retimbered. It is the intention of the company to pump out the shaft and prepare the lower workings for an examination of the ore bodies found years ago to ascertain their value before proceeding to any expenditures in the line of reduction works. The upper workings look favorable.

Amador.

The Gillick Bros., at Volcano, are sinking on the Studhorse. Below 50 feet they have struck hard rock. The prospect is good.

Mason and Griesbach have struck their pay chute in the new tunnel. They have good prospects.

The Ironbound is driving the tunnel with three 8-hour shifts.

The Robinson mine has been bonded and will soon be in operation.

Butte.

The Golden Feather Co. has concluded that the upper part of the river bed has been so thoroughly mined by the old workers that they are not justified in recommending any further outlay in reopening that portion of the claim. Another property has been offered them which is thought will yield a substantial profit. It consists of a large area of ancient river channel near Magalia. If the offer is accepted a new company will be formed under the title of the Magalia Consolidated Gold Mines, Limited. The price stated is $25,000.

A deed was filed last week conveying to G. H. Evans forty acres of mining land adjacent to Oroville. Mr. Evans also has bonded 200 acres, with privilege of prospecting the same.

The Oroville *Mercury* says that a project is under way to prospect the mountains near Forbestown by a tunnel. The Gold Bank tunnel, run into the mountain 1800 feet before intersecting the lode, has demonstrated that a saving has been accomplished by H. B. Stow, as it will do away with the expenses of hoisting and pumping machinery and drain the mine by gravitation. Ores that could not have been worked at all by the old method can now be handled at a profit.

Following the completion of the Gold Bank tunnel, the Syndicate G. M. & M. Co. is preparing for the construction of 5000 feet of tunnel and shaft.

From what is known of Forbestown hill and the number of veins that penetrate it, it is not unreasonable to suppose the Syndicate tunnel will cut many of these lodes. A conservative estimate places the number at not less than thirty.

The Butte Star mine is running and has a number of men employed. The Perry mine has started up at full blast.

Calaveras.

(Special Correspondence).—The Spanish Bar G. M. Co. have begun work, preparatory to extensive hydraulic operations, four miles from Mokelumne Hill. The officers of the corporation are: John Hay, Pres.; H. J. Grauerholz, Treas., and Jos. Kline, Sec., all of San Francisco, and W. T. Robinson of this place Supt. The company is building a large storage reservoir. Water will be furnished by the Foorman ditch. A hydraulic elevator is being placed. The property comprises thirty acres and is of a promising nature. The office of the company is at 224 Front St., San Francisco.

Mokelumne Hill, March 1st, '98.

An 18-foot ledge has been encountered in the crosscut running east on the 600-foot level of the Thorpe mine at Fourth Crossing. Berkeley people are the principal owners of the property.

The South Paloma mine at Valley Springs is temporarily closed down pending the result of present developments in the south shaft of the Gwin mine.

Citizen: The Machu mine at West Point has been bonded to a Salt Lake company. It will be started at once.

El Dorado.

(Special Correspondence).—The 5-stamp mill on the Larkin is steadily running on a fair grade of ore.

Development on the Selby by the Larkin Bros. is proceeding with good results in the output of ore.

John Melton has secured all the ground between the Gentle Annie mine and the American river, comprising several hundred acres. He will drive a tunnel from the river south to the old Poverty Point section and open up considerable new ground.

The twenty stamps at the Grand Victory are running continuously, and I am informed that the ore is improving.

The Salisbury is idle at present. The large ore bodies in this property, comprising nearly 300 acres, are of low-grade, averaging from $4 to $5 per ton with a fair percentage of sulphurets. The property, to be worked profitably, requires a large milling and cyanide plant.

The Mierson Consolidated and the Lloyd properties, adjoining town, are idle temporarily, awaiting capital to continue development.

I am reliably informed that Salt Lake people will begin work previous to the 1st of May on the old Pacific group, located almost in the heart of town, stretching to the American river in one direction and two miles to the south in an opposite direction.

There is much activity about Grizzly Flats, twenty-six miles east of here. Two shafts are going down on the old Mt. Pleasant, and work is pushed.

The old Church Union, southwest of town, is taking out $40 ore and keeping twenty stamps in constant motion.

Placerville, Feb. 26th, '98.

The Placerville *Democrat*, published a few miles from the historic spot where Marshall discovered gold, signalized the 50th anniversary of that event by issuing a superb jubilee edition on fine paper, profusely illustrated and of present and historic value. Mr. Carpenter is to be congratulated on the successful completion of a journalistic effort that would be a credit to a community many times the size of Placerville.

Brye & Lozano in the Bellevue are taking out good quartz. Over a month ago they struck a lead which has increased in value as they go in.

At the old Melton claim on Weaver creek, Potts & Co. are taking out paying gravel.

I. L. Moore, Gen. Mgr. of the Lucky Marion at Greenwood says that the company will resume active operations early this spring.

The Lone Star gravel mine, near Smith's Flat, owned by Proctor, Mountain & Co., is meeting with success. There are twenty men at work, and the 10-stamp mill is in motion day and night. The gold runs $19.50 an ounce.

Nugget: In the north drift at the 250-foot level of the Griffith Con. mine a valuable body of ore has been encountered.

Nugget: Kelley & Ball have leased the 10-stamp mill on the Big Sandy, and are working the mine on shares with the owners, who are a Toledo company.

Kern.

The new mill of the Johannesburg Reduction Works was seriously damaged last week by the breaking of the main shaft of the engine. They had been making some repairs to the mill and had just finished them and started the mill at 5 o'clock in the morning, and were hammering out the yellow stuff contained in the Wedge ore, when about 10 o'clock the main shaft broke and one of the big fly wheels went whizzing through the side of the building. The engine is a total wreck and beyond repair. It was a 20 H. P. Foos engine; there was a flaw in the most vital part of it, and to this the accident was due. Mr. Griffith, one of the proprietors, had a narrow escape, as he had just been standing where the big wheel went through the side of the building, and had stepped away a moment before the accident occurred. Another engine will be procured immediately, and the work will be delayed but a short time.

Miner: When the plowing for the pipe line was being done at Randsburg, H. Watson discovered some ore. Upon further development a ledge 16 inches wide was shown, and there is a pay streak of about 8 inches that yields a good prospect.

The Rand people have increased their force, and their daily output of ore is near 100 tons, running from $30 to $150 in value. They employ 120 men.

At Randsburg a company is figuring on an electric plant to supply 500 lights, with power sufficient to develop twice that number.

Review: The Garlock cyanide works were leased at the beginning of the year by Bell & Heydlouff. The weather in early January was too cold for satisfactory work, yet the first clean-up at the middle of the month showed well. Since the weather became warmer the work has been progressing successfully. They are working from 200 to 240 tons per month. The percolation process is used with wooden tanks. The precipitates are recovered by the acid process. The tailings are job lots from various mills, one of the largest being the Pinmore product, milled at the McKlearnan mill in November and December, 1897. They are paying 85 per cent of the assay value of the tailings, and deducting $3 per ton for working them. The assay value runs from $4 to $18 per ton, averaging probably $6 per ton. The work since the beginning of the year has been on tailings where the slimes were, during the stamp-milling process, separated from the essential parts simply by letting the water carrying the slimes flow off. This has proved to be the most satisfactory way of working these tailings. The slimes carry very little gold and seriously interfere with the percolation process. There are large quantities of low grade tailings at the various mills not yet worked.

One of the most interesting mines near Garlock is the property of E. B. Beecher. The ore thus far has been confined to a series of chimneys or "blow-outs," six of which have been worked 12 to 15 feet deep. These chimneys are in a line with each other, showing that they are off-shoots from the same ledge. Some of them are 16 feet lengthwise and 2 to 3 feet wide. The ore is high grade. There have been several mill runs which yielded good results. Mr. Beecher has temporarily ceased working the chimneys and is running a tunnel 100 feet below the lowest shaft. He has gone 40 feet and is working two shafts. W. S. Brigham has located the extension of this mine and finds the same arrangement of chimneys carrying the same kind of ore. He plans to push his development work right ahead.

Hoffman & Fay have begun developing a newly discovered prospect near the Colorado camp in the Goler district, eight miles from Garlock.

Los Angeles.

The Los Angeles Reduction Co. has incorporated to build and operate reduction works and smelters; principal place of business, Los Angeles; capital stock, $30,000; amount subscribed, $16,000; directors—H. Wickizer, A. Granville, J. W. Ghiselin, J. B. Hawley, A. B. Thomas, of Los Angeles.

Mariposa.

Gazette: The Virginia is running, but on account of water runs by "fits and starts."

Mentzer & Dexter are taking out good ore at Dogtown.

Mono.

At the annual meeting of the Standard Con. M. Co. Monday the old management was re-elected, J. W. Pew Sec. and R. G. Brown Supt. The company has $55,780.13 on hand.

Nevada.

(Special Correspondence). — The Reward mine, located within ten minutes' walk of Nevada City, after long and persistent work is finally out of debt. The present company took up the property after years of abandonment. When they had discovered ore of a paying quality water became too strong for them, and they ran a drain tunnel to Deer creek, a distance of 2400 feet, after which work was resumed developing the mine. They have reached a depth of 700 feet. They have been operating a 2-stamp mill. Last month they cleaned up $6000. They have ore blocked out above the 600 that will run them six months. At the 700 a new chute is coming in. The ledge is from 7 to 12 inches wide and its lowest value is $27, though some of it runs as high as $200 per ton. The sulphurets go 4½ per cent and run from $180 to $200 per ton.

The company is now out of debt and, beginning with February, will be a regular dividend payer. The property is owned by Nevada City and San Francisco people. J. Gribble is Supt.

The Texas, another property abandoned in the long ago, is showing encouragingly. The shaft is going down rapidly. It is considerably below 200 feet.

The Bellefontaine, also a property taken up after years of abandonment, is producing good ore. The owners have arranged to move a mill onto the property.

This section on the Father Lode is continuing its good record.

Nevada City, Feb. 26th, '98.

(Special Correspondence).—The Brunswick at Grass Valley started ten stamps last Tuesday on a good grade of ore. The stamps have been hung up for some time pending the placing of new pumps and subsequent unwatering. The company hopes soon to run the full twenty stamps.

Grass Valley, March 2nd, '98.

At the Red Dog mine, near You Bet, hydraulicking is in progress.

The Mistletoe M. Co. elected the following officers: D. E. Morgan, T. H. Wilhelm, F. J. Thomas, E. B. Power, W. J. Rogers. D. E. Morgan is president, W. J. Rogers secretary. The Mistletoe mine is located at Rough and Ready.

Union: At the Milliken mine, near Nevada City, the hard bar of rock has been overcome. The shaft is 600 feet deep, from which a drift has been run 400 feet. The ground is a soft granite, and from the indications gravel will be encountered in a short time.

The water is off at the Delaware, Harmony and other gravel mines, Nevada City, in consequence of which the miners are laid off. There is a break in the ditch near Blue canyon, caused by a snowslide.

In a few days the Phœnix mine, at Nevada City, will be clear of water. The water is lowered to the 400 level. The shaft is 480 feet deep. As soon as the mine is dry sinking will be inaugurated and pushed.

Work was suspended at the Gold Hill until the arrival of the compressor, but now a force of twenty-four men are at work, the miners working eight hours and three shifts employed. The shaft, which is 750 feet, will be sunk an additional 500 feet, which Supt. Hopkins estimates will take four or five months if no hard ground is encountered. In the meantime no other development work will be done. There is a ledge in the shaft, but the quartz is broken up, and more depth is necessary to get a solid formation. The old workings in the mine have been explored, but the riches of early days have been pretty well exhausted.

The Gold Hill has a record of over four million dollars to its credit. Those best able to know assert that there is a continuous communication in quartz between the workings in the Massachusetts Hill and Gold Hill, leaving, apparently, no doubt of the identity of the vein. The Massachusetts Hill is yielding handsomely, and the Gold Hill, under the circumstances, has good prospects.

Union: Progress is made at the Texas mine, the main shaft having reached 190 feet. Drifts will be run and sinking continued right along.

At the Eagle Bird mine, Maybert, the ore is turning out satisfactorily and the men are making good wages on the tribute system.

Union: Drifting at La Suerte mine, near Nevada City, is going on from the 350-foot level, and another drift was started Tuesday.

Plumas.

Bulletin: On Kellogg ridge, four miles east of Merrimack, the Kellogg Con. M. Co. has a 14-foot ledge of decomposed quartz on which development work will be resumed in the spring. The company expects to put in a cyanide plant the coming season. The Buckeye mine has a good prospect in drift gravel. Shafts are sunk and nine miles of ditch cleaned out ready for use the coming spring.

Riverside.

The machinery of the Alice mine will be shipped to Mexico. After considerable experimenting it has been found that it is unsuited to the reduction of the refractory ore, which must be treated by the cyanide process.

The Blue Rock, near Winchester, is 60 feet on the ledge, which is 20 inches, and has eighty tons of ore on the dump.

San Diego.

Ramona *Sentinel*: At the North and South Hubbard a crosscut tunnel on the dividing line about 340 feet in length taps the lead 200 feet in depth, and is used for a working tunnel by both properties.

The Ready Relief and Redmond mines, with a 10-stamp mill, are in constant operation.

The Alpha has a crosscut tunnel 230 feet tapping the ledge which is 2 feet of low-grade ore.

The Kentuck S. is cutting the vein 300 feet in depth with a 900-foot crosscut tunnel. The shaft by which the mine was worked to water level yielded $57,000 at a depth of 120 feet some years ago, since which time it has practically been idle.

The Antelope is being worked by Delgrove & Walker. They have a chute of good ore at the bottom of a 43-foot shaft.

Ramona *Sentinel*: The North Star has a shaft 150 feet on the ledge, with a drift at the 100 and 150-foot levels. The ledge averages 14 inches; length of ore chute as far as opened, 40 feet.

The Ranchita mine has a shaft 240 feet, and a 5-stamp mill running night and day.

Sierra.

Dr. Ellis is having rock from the Mexican mine crushed at the Gold Bluff mill.

The Bald Mountain Extension is sinking in the Lava at the end of the north tunnel. They are down about 50 feet.

Sacramento.

Folsom *Telegraph*: English capitalists have secured a bond for 100 acres of gravel land from the Natoma Co. and work will be commenced as soon as the necessary machinery can be placed.

R. H. Gegax is sinking a shaft near the Placerville switch, which prospects well.

G. White is mining on the property of A. A. Borges, and has struck good prospects.

Prairie City, a few miles from Folsom, has taken on new activity in mining.

Shasta.

The Redding *Searchlight* this week is a mammoth 62-page edition, handsomely illustrated and replete with valuable mining news of northern California. Trinity, Siskiyou, Shasta, Modoc and Lassen counties are well represented in its enterprising columns. The edition is throughout a home product and is a credit to its enterprising publisher, M. Dittmar. The illustrations are good, the reading matter is reliable and the publication is of real value to the section it fully portrays.

Development on the Mammoth mines near Kennet shows sulphide ore that carries 5 per cent in copper and good values in both gold and silver. The ore body is estimated to be from 160 to 200 feet wide.

E. Markwick purchased four claims in the Muletown belt and will push development. The ore in these claims is said to contain a good per cent of copper.

The London T. Co. is at work on their property near Muletown and at a depth of 180 feet is finding ore carrying gold and copper.

The Clear Creek P. Co. is putting in a dam to divert the water of South Fork and run it to their smelter, on Clear creek, this side of Igo. New machinery is being added to the smelter, and Mr. Markwick says it will be ready for operation by May 1st.

Siskiyou.

The Colorado Co. is opening the Hegler Bros. quartz mine on Humbug, and find good prospects.

The old Gold Ball mine at Salmon river from a crushing of ninety tons of quartz paid $18 to the ton.

The Aromas Hydraulic Co. at Salmon river has thirty men building a ditch, and expects to commence operations soon with a good supply of water.

The Salmon River Hydraulic Co., at Sawyer's Bar, has been hurrying ditching and fluming, and expects to start the giants in June.

The Greenhorn blue gravel mine commenced work last week. Shaft No. 3 is to be sunk to bedrock. A crosscut will be made from one side of the creek bed to the other.

The hydraulic mines near Oak Bar are turning out good lately, but there is only water enough to permit day work.

The Chinese company working a claim on Greenhorn creek has a good supply of water and is working steadily.

The King Solomon mine at Salmon river will be supplied with eight additional stamps.

W. Shell started his giant at New Pinery last week.

Reporter: Work at the Littlefield mine, near Callahans, is progressing.

At present there are only six men employed at the Black Bear mine.

W. Hobart is piping with a full crew of men. His ground prospects well.

This has probably been the dryest season ever known in the Salmon country. As a consequence, very few hydraulic claims are being operated.

The Horton Gulch and Summerville hydraulic mines, near South Fork of Salmon, are in operation day and night.

Tulare.

J. Roth bought the Mexican mine, White river, and will put men to work immediately.

McGorray & Co., on the Grey Eagle mine, are taking out rock which is said to pay $50 to the ton.

Tuolumne.

E. W. Chapman has secured the Calf Pasture and Heenan ledges in the Rock Creek district; W. C. Ralston the Buckhorn quartz mine in Ralston mining district.

On the Alameda the shaft is down 600 feet, with drifts run on the 100, 200, 400 and 500-foot levels.

Alameda county people have undertaken to develop the old Patterson gold mine near Tuttletown. The new company incorporated under the name of the Tri-Color Co.

The Eagle-Shawmut mine is an old property reopened a couple of years ago. Assays at different distances in the tunnel show up about the same, $28 being the average.

The Poor Man's Friend mine, located in Duckwall canyon, shows a vein which assays from $11 to $80 per ton. A tunnel 120 feet on the vein is the present point of working.

A. Briggs found a piece of quartz near Columbia last week containing $140 in gold.

The Golden Rule is running on good rock.

The electric plant of the Jumper mine is in full blast.

The Sonora *Democrat* says that another vein

has been struck in the Mountain Lily mine.

Good ore is being taken from the Harriman mine.

The Alameda contemplates erecting a mill.

The Eagle-Shawmut Co. intends to double the capacity of their mill. Twenty stamps are now in operation.

Democrat: A 40-stamp mill on the Patterson mine is one of the contemplated improvements in the vicinity of Tuttletown. It is said that chlorination works will be erected on the Gagnier mine.

Trinity.

About forty hydraulic miners employed by the La Grange Co. near Weaverville have struck against a cut in wages. The cessation of work entails a loss to all.

Yuba.

Lane & Co. are building a dredge on the Yuba river to operate on Howlett's bar, six miles from Browns Valley.

NEVADA.

The De Lamar *Lode* says that at the April Fool mine two large tanks are filled every day with $80 gold rock.

Men have been put to work at the cave of the De Lamar mine to quarry the ore that is exposed, enabling the company to extract hundreds of tons every day.

The McArdle M. Co. is shipping ore from their Salmon mines, near Wells. Two carloads of copper ore were shipped by the company last week.

The White Pine *News* says that the Golden Crown M. Co. has a large ledge carrying a percentage of manganese, silver and gold. They have six men at work. S. Davis is Supt.

The Glasgow & Western Expl. Co., on the Star and Grey Eagle group, is producing ore already concentrated by Nature, which they are shipping. In addition they are shipping concentrates from the mill which is in constant operation.

At the Chainman all work except that of pumping has been suspended at the mine and mill. The water is being lowered in the old workings and when under control sinking will be resumed.

In the Savage M. Co.'s ground on the Comstock lode, on the 130 level, the main west drift has been cleaned out and repaired a distance of 12 feet; total length, 390 feet. Brunswick lode—East crosscut No. 3 was advanced 5 feet; face in porphyry, with streaks of quartz giving low assays; total length, 65 feet. Work was resumed in main north drift, 600 level, on March 1. Incline shaft No. 1 has been sunk a distance of 14 feet; total depth, 1092 feet; bottom in porphyry.

In the Crown Point mine have been extracted about 300 tons of gold ore during the past week, and shipped to the Nevada mill fifty tons prior to March 1, on which date they intended to ship 250 tons to the Mexican mill for treatment, and thus compare the two methods of concentration. Pending the working of this ore they have suspended operations in the Crown Point mine.

In the Belcher, on the 1200 level, the north drift from the east crosscut from the main north drift from the incline is now in 95 feet, having been cleaned out and repaired 15 feet during the past week. The east crosscut from the north drift on the same level is out 11 feet, 6 feet having been added during the week; the face shows a mixture of quartz and porphyry. There have been hoisted during the week forty-one carloads of ore, the average car sample assaying $19.83 per ton.

The yield of the Overman for the past week amounted to six carloads of ore, of the average car sample assay of $24.79 per ton. This ore was extracted from the workings in the north drift on the 900 level.

At the Justice mine the west crosscut No. 2, started from the face of the south lateral drift, was turned to a southeasterly course and advanced 24 feet during the week, making its total length 133 feet; the face is in 18 inches of ore giving average assays of $33 16 gold and $74.28 silver, or a total of $107.44 per ton. During the week they shipped thirty-five tons of ore to the Douglas mill. Ore milled for the week, fifty tons; battery samples average, gold, $7.70; silver, $14.89; total, $22.59 per ton.

OREGON.

The width of the ledge in the Peacock, at Seven Devils, says the Baker City *Democrat*, is 102 feet and will average 22 per cent copper. An assay of the ore returns: copper, 35 per cent; gold, $10 60; silver, 18 ounces.

The *Observer* reports the finding of an extensive deposit of tin ore on the Illinois river in Josephine county.

The Jupiter G. M. Co. of New York has established at Kerby a complete assay office for the purpose of testing the value of the porphyry dikes on the Upper Althouse and Canyon creeks in Josephine county. They have bonded the placer and quartz mines of F. Houston in the Althouse district, and expect to develop these properties.

Hostler & Morris have located eight placer claims on Murphy creek, Josephine county, and will sink a series of shafts to bedrock.

Dr. Moore has bought a one-half interest in the Edison quartz ledge, eight miles south of Grants Pass, and has commenced developing the property.

Bennett Bros. of Terre Haute, Ind., have bonded a group of claims at Cornucopia for $75,000.

J. W. Robinson is running the Brass Nail placer, near Grants Pass, and cleaning up $50 per day.

J. C. Cope is equipping a hydraulic mine at Galice creek, and will start work in a few days.

The Lightner mill, Grants Pass, is crushing one and a half tons per day.

Observer: The Alexander and Bent placers, at Galice creek, are working full blast day and night. The ground pays from surface to bedrock, a distance of 120 feet.

H. C. McIntosh, near Grants Pass, is running two giants, with plenty of water and good prospects.

Messenger & Co. have started piping in Cayote.

Mr. Massie is doing development work in quartz on Cayote having 5 feet of ledge matter and prospected throughout.

The Sarah Belle Co., Grants Pass, after two years' development work, found a 4-foot ledge in slate and are extracting good ore.

WASHINGTON.

The Wells Fargo mine, at Springdale, has a tunnel 125 feet, and the ledge matter over 10 feet wide with well-defined walls.

BRITISH COLUMBIA.

(Special Correspondence).—The Channe M. Co. have pooled most of their stock and have reduced their capitalization from $1,000,000 to $250,000.

At Harrison Lake the Fire Money Co. is crushing free milling ore.

At Fairview the Smuggler Co. has decided to erect a 20-stamp mill.

The Tinhorn Co. claim that, through a mistake of their Supt., they have gone in several hundred feet on broken vein matter too poor to run through their mill, and that it will take time to remedy the mistake. On the other hand, the Winchester Co., operated by the same people, is down 90 feet in ore, and a 175-ton mill test, it is reported, went $40 a ton, chiefly in the concentrates, the plates holding something over $5 a ton.

Vancouver, March 1st, '98.

The Brooklyn in Greenwood has been bonded to W. McKenzie for $75,000, on which a cash payment of 10 per cent has been made. The property is a copper-gold proposition. Bulk tests show the ore to run $8 to $12 per ton in gold and 3 to 8 per cent copper.

The ore shipments of 1898 via the port of Nelson up to the 18th ult. come to 15,507 tons, valued at $1,845,225.

The force on the Good Friday at Rossland has been increased to thirty men. E. Voight is Supt

The War Eagle ore chute, which produced $87,000 in dividends under the Clark management, has been found in the 375-foot level, and is being developed.

THE KLONDIKE.

Collector of Customs Huestis at Port Townsend has received from the Treasury Department official notice of the opening of the Chilcoot Railway and Transportation Co. of Alaska as carriers of bonded freight and merchandise between the sub-port of Dyea and the British line.

The chief engineer of the Chilcoot Railroad & Transport Co. from Dyea says that the severe storms of February have interfered somewhat with the operation of the company's aerial tramway and caused delay to several thousand Klondikers in their effort to get over the pass. Sheep Camp has been turned into a city of tents and cabins, the latter belonging to men who have decided to engage in business. He says that 1500 men are blockaded there, and estimates that 3500 more people are strung out between Sheep Camp and Dyea.

Snow slides have buried a quantity of outfits near the Scales many feet deep. The owners must now wait until May before they can hope to recover their supplies. The piles of outfits to be seen around Sheep Camp are described as enormous. A number of wholesale stores could be started with supplies that have been hauled upon the ice at the cheap rates now prevailing. Freighters are hauling goods fourteen miles on sleds to Sheep Camp for 2 and 3 cents per pound, and for as much more they can be taken up to the Scales, four miles higher up, whence they are lifted over the summit.

Material for the Chilcoot Co.'s second cable was being pushed forward to Canyon City when he left, and it will soon be in operation between Canyon City and Sheep Camp. The vital part of the tramway system is a cable over the summit from Sheep Camp to Crater lake. This was started two weeks ago, but its operation has been delayed by storms. The company has, nevertheless, succeeded in moving all freight for the Canadian Government which it contracted to take over three weeks ago at 15 cents per pound.

During a recent blizzard on the summit of the pass 6 and 8 feet of snow fell in a single day. In places now the snow is 30 to 40 feet deep, and greatest care has to be exercised not to get off the beaten trail, for otherwise life is endangered.

He says that whatever gold there is in Stewart river, he is willing to part with his interest without any consideration whatever. Another who claimed to have ascended the Stewart 260 miles states that at that distance vegetation ceases and there is nothing but a vast field of snow and ice on every hand.

W. J. Beall, who has returned from Stewart river, sixty-eight miles above Dawson, says there is an encampment there of 400 people. He says the Stewart is practically an unknown river, only five men having succeeded in getting up any distance. The Stewart is said to be a treacherous stream.

The steamer Islander, which arrived at Victoria on the 2d, brings news that soldiers have taken charge of affairs at Skaguay. Scores of persons are dying at Skaguay and Dyea. The disease prevalent at Skaguay is spinal meningitis. A healthy man will feel slight chills ascend the spinal column, in a few hours the back of the neck becomes stiff and cold, the head is forced back, the brain becomes cloudy and soon reason goes. Black spots appear all over the body, and in a few hours death supervenes.

Two of the Queen's passengers died soon after their arrival in Skaguay—one of spinal meningitis, the other of heart disease.

Passengers on the Islander confirm the report that the Canadian flag has been raised at Summit lake, and state that it was done by order of Major Perry of the mounted police.

The report comes from Dyea that the Canadian Government will shortly establish a post at Crater lake, and, with twenty mounted police, enforce the collection of customs duties.

IDAHO.

The Ontario, Mammoth and other mines on Florida will be worked this season. The former milled a small lot of ore a few years ago which gave returns of about $300 per ton in gold.

The Florida Mountain Co. is sinking on its Humboldt mine, and expects to be in full operation this summer. This alone will mean a largely enhanced output. The property is equipped with a 20-stamp mill.

The Potosi mine is being operated under lease.

The Trader's Con. G. M. Co. is doing extensive development work.

At DeLamar the DeLamar M. Co. is installing a cyanide plant, a portion of which is in operation. This not only means a long lease of life for the company mines, but opens the way for the Garfield, Lepley and other low-grade properties in that district.

Silver City *Avalanche*: The mines of Owyhee produced from 1865 to 1875 about $30,000,000, and it now looks as though the output of that period will be duplicated and surpassed in the 1895-1905 decade.

In 1895 the output of Owyhee county, as given by the United States Assay Office at Boise, was $2,405,675; in 1896 it was $2,527,663, a gain of $121,988 For 1897 we have been unable to obtain exact figures, but it is known that the production was greater than that of the previous year. The Trade Dollar mines alone paid a half a million in dividends during 1897.

The recent developments in the Cumberland mine on War Eagle put it in the list of steady producers for 1898.

At the Poorman, whose first 100 tons of ore in 1865 gave mill returns of $90,000, it is known that good bodies of pay ore have been opened in the lowest levels.

The owners of the Tip Top group, idle for a number of years, have decided to push a tunnel into the property as soon as spring opens.

About the only drawback to a steady and rapid increase in mining in this section is the fact that we have no sampling mill, where prospectors and leasers can sell their small lots of ore. With a small sampler and custom (combination) mill, there would be increased activity in leasing and prospecting.

The statement prepared by the U. S. Assay Office at Boise shows that the production of gold in Idaho during 1897 was $6,626,564; silver, $7,103,321. Total, $13,729,885. This is an increase over 1896 of $1,978,040.

The Red Horse placer claim, near Elk City, has been sold to G. P. Mims for $10,000. Mr. Mims will equip the property with two giants with 10-inch piping and will build a mile ditch. Work will begin at once.

The Sellers Bros., near Salmon, cut a good sized ledge of copper and gold.

Ford & Brown have cut a 4-foot ledge of copper in the Brown Bear in Lemhi Co.

UTAH.

The Liberal of Bingham marketed its first lot of concentrates last week, showing 28 per cent lead, 7 ounces in silver and $1 in gold. The concentrates are derived from a very low grade material, which has been improving as it has been followed up.

The *Tribune* is informed that the Copper King, near Logan, has uncovered a vein of ore from 30 to 40 feet in width, abounding in native and peacock copper and oxide of copper. It also carries both gold and silver in appreciable amounts. The Copper King is being steadily developed.

In the new strike on the Martha Washington at Tintic, on the 250-foot level forty tons have been extracted showing an assay value of over 200 ounces silver and $4 in gold.

In the United States Supreme Court an opinion was handed down in the case of E. F. Holden vs. the Sheriff of Salt Lake county, involving the constitutionality of the territorial law fixing a day's work in smelters and mines in the Territory at eight hours. Holden was arrested for violating the law and sentenced to imprisonment. He brought the case to the Supreme Court in an effort to secure a writ of error on the ground that the law was unconstitutional in that it was calculated to deprive a citizen of life or property without due process of law. The court held that such was not the case, but that the law was an exercise of the State's police powers. Justice Brown said, in passing upon the case, that it was not the intention of the court to pass generally upon the constitutionality of the eight-hour laws, but that, in so far as State laws were exerted for the protection of the lives, the health or the morals of a community, there could be no doubt of the exceptional and unhealthful character of work in smelters or mines, because of bad air, high temperature and noxious gases, and hence the wisdom of the State Legislature. The decision of the Supreme Court of Utah was affirmed.

Eastern parties have, through R. O'Neill, secured a bond for $30,000 on the Cascade mine at Marysvale. The bond runs for two years in semi-annual payments.

The *Mercury* says D. Eyer has secured the Gold King group at Manning, and will develop the property thoroughly. A force is already engaged running a tunnel which will tap the vein at depth.

The mines of Bingham one day last week shipped twenty cars of ore. The consignment was the heaviest that has been sent out of the camp in nearly three years. Among the more prominent in the big output were the Spanish, the Old Jordan, Giant Chief and Phœnix. The ores generally show a high percentage in lead, with a fair amount of silver and small values in gold.

Tribune: The Geyser-Marion M. C. will proceed at once with the enlargement of the Geyser mill, which will have its capacity increased to 150 tons a day.

The filling of the bins at the Golden Gate mill has begun, and the crushers put through a rehearsal.

Although no attempt was made by Secretary Almy to estimate the value of the Daly tailings as an asset, it is well known that the management regards them as a source of considerable revenue, and capable of providing for half a dozen dividends of $25,000 each. Recent experiments at the Marsac mill, through which 500 tons were passed, convinced Supt. Chambers that the tailings could be made to yield a fair profit, and as there are 200,000 tons on the dump arrangements to work them will be undertaken. It has been said that the tailings will net $2.50 per ton.

The Old Jordan mill has run steadily during February and delivered 1600 tons of concentrates.

Another strike is reported in the Antelope group at Bingham, in which the ore shows thirty-five ounces silver and $8.10 in gold per ton.

The Bingham *Bulletin* says that the developments of the Starlus mine consist of 1200 feet of openings, including a main tunnel driven 790 feet, crosscuts from it to determine width of vein, an incline tunnel sunk 160 feet, and 200 feet of drifting at 200 level. Everywhere there is mineral in sight, varying from 10 inches to 3 feet. An average of all assays gives about five ounces silver, $2 in gold and 8 to 9 per cent copper per ton.

The *Tribune* states that the starting up of the Daly-West mill and the marketing of ore will take place in a short time. The mill, with a capacity for handling 100 tons a day, is in readiness, while blocked out is enough ore with which to supply it for an indefinite period.

Tintic *Miner*: It is reported that a strike of lead carbonates in the shaft of the Lower Mammoth has widened into 3 feet of ore that shows a value of 25 per cent lead, fifty ounces silver and about $4 in gold.

The Silver City G. & S. M. Co. has filed an action against M. K. Lowry and others, says the Salt Lake *Tribune*, to quiet title to what is regarded a valuable area in conflict between the Wheeler and Little Clarissa mining claims in Tintic district.

The settlements in the ore and bullion market on Tuesday sustain the reports that the tonnage for the month just closed is in excess of the corresponding period last year, and that everything indicates a steady increase as the roads between the mines and railway tracks improve.

The Crystal at Marysvale contemplates many changes for the new mill.

The Galena Co. is engaged in making the heaviest shipment that has been undertaken by that company in over a year. The lot consists of forty tons, the assays showing 32 per cent lead and 88 ounces in silver.

Tribune: Efforts to harmonize contending interests in the Daly-West having failed, the stockholders in that portion of it which is incorporated adopted a resolution calling on Daly to start the mill and begin marketing ores as soon as, in his judgment, it is expedient. The mill is ready to start at a few hours' notice, while the marketing of crude ore, which averages about 25 per cent lead, from 50 to 65 ounces silver, $1.50 in gold and $2.50 in copper, could begin at any hour.

MONTANA.

The Golden Sceptre M. Co. of Quigley has reorganized, and the mine and mill will both be put in operation. The old company spent $650,000 on the property and passed into receiver's hands with debts aggregating a quarter of a million dollars. New stock has been issued to the creditors and $400,000 new capital put into the property. Manager McDonald says they have in sight enough low grade milling ore to turn the mill for fifty years. "The ore runs $4 to the ton, but we can handle it for $1 a ton when the plant is fairly in operation. There remains four miles of a tramway to be completed."

It is stated that the Snowshoe mine at Libby is soon to become the property of an English company. The price is believed to be in the neighborhood of $200,000.

After paying dividends to the amount of $2,175,000 the Hecla Con. at Glendale is reported to be in a bad way. Gen. Mgr. Knippenberg in his report for 1897 showed a loss of $39,438.50, and calls attention to the fact that the surplus has been drawn upon to run the property during the past twelve months. The decrease in the quantity of lead ore produced in the mine, which necessitated the closing of the smelter because of the insufficiency of lead ores to melt it, is mentioned as the principal reason of the failure of the property to produce at a profit the last year.

The Hecla Con. properties produce lead, copper and silver and a small quantity of gold. The number of pounds of lead bullion produced was greatest in 1888, when it reached 6,884,857 pounds, and it declined steadily after 1894. The production of silver varied from 716,859 ounces in 1888 to 215,431 ounces last year. The percentage of gold was comparatively small, 300 to 400 ounces being an average for a year. The Gen. Mgr's report gives the following statement of the production of the mine during the years beginning with 1881:

Year.	Pounds Lead Bullion.	Pounds Copper.	Ounces Silver.	Ounces Gold.
1881....	4,843,646	215,067	534,197	....
1882....	4,984,697	229,708	547,754	307
1883....	5,203,919	308,519	662,835	402
1884....	4,589,280	339,928	656,849	248
1885....	5,528,653	177,567	686,845	712
1886....	4 102,040	64,786	389,707	999
1887....	4,663,148	123,642	474,719	441
1888....	6,884,857	208,605	716,859	1,210
1889....	6,138,258	228,380	579,430	1,098
1890....	4,298,176	159,981	480,904	691
1891....	4,030,947	89,674	485,209	666
1892....	3,304,040	157,516	364,396	343
1893....	1,973,851	94,095	326,340	210
1894....	2,941,912	362,897	616,808	343
1895....	1,175,523	239,631	347,642	339
1896....	1,331,645	315,702	365,223	547
1897....	1,990,175	184,836	215,431	405

The cost of mining a ton last year was

$20.52. The number of tons handled was 44623/4. The total number of tons produced since 1876 was 197,3022/5, the cost of mining having been as low as $12.78 in 1878. The mine in 1897 had a pay-roll of $212,897, running from $13,000 to $29,000 for the various months. The mine was run at a profit of $12,138 in January and made $5013 in October; but all other months showed losses, running up to $13,684 in August, making losses aggregating $59,684, and a net loss of $39,438 for the year. In his report Mr. Knippenberg says: "At the time I wrote my last annual report I thought, from appearances, that 1897 would be a fairly profitable year. My hopes were not realized; my judgment was at fault. Month by month the lead ore became less in quantity and lower in value, until we were obliged to close down the smelter, because we had not sufficient lead ores to run. As a result, the year 1897 not only shows no profit, but an absolute loss. We have been compelled to use up the surplus we had on hand at the beginning of the year, viz: Surplus Jan. 1, 1897, $71,218 62; total receipts, 1897, $173,459.41—$244,678.03. Total expenses, 1897, $212.897.91; dividends Nos. 144 and 145, $30,000—$242,897.91; surplus Dec. 31, 1897, $1,780.12. Placing the year squarely upon its own merits, we show a loss of $39,438.50. During 1897 we ran one furnace 263 days of twenty-four hours each, consuming 4614 tons of ore and concentrates, 224 tons of roasted flue dust and 293 tons of skimmings; in all, 5131 tons of material containing silver and lead. The average assay value of this material was 28 4-10 per cent lead, 27 1-10 per cent silica, 16 1-10 per cent zinc and 44 94-100 ounces of silver per ton."

The Magg A. Gibson and A. F. Grater dredges at Bannack struck good ground last fall and the output of gold from these dredges will be more than twice that of last year. A. F. Ball, representing an English company that is constructing the dredge three miles from town, will push work.

Edwards & Curin commenced work on the Excelsor, near Bannack. The mine is leased from the Western Enterprise Co. of Butte.

The Ruby mine has produced in the last six months nearly $200,000 worth of ore.

L. Z. Leiter, through his agent, E. H. Treise, purchased the Black Eagle, near Sheridan, for $5500.

Work started on the Jim Blaine claim in Republic.

The suit between the Boston & Montana Co. and the Montana Ore Purchasing Co. is being fought out under the law of apex and involves about $500,000.

A. M. Easterly is working the Hard Cash lode at Radersburg, and has opened up a good body of ore.

On the Hope mine at Basin the water is pumped to the 100-foot level.

The *Madisonian* says that less than 200 tons of ore were crushed at the Madison, on the Big Hole river, but enough to demonstrate the utter worthlessness of the mines. The new 20-stamp mill and other machinery has been moved to the Pipestone mine.

SOUTH DAKOTA.

At Deadwood the property of the Portland Con. M. Co. was sold on the 1st by the sheriff to satisfy a judgment of foreclosure. The property was bid in by H. W. Seaman of Clinton, Iowa, trustee of the stockholders, for $388,798.

MICHIGAN.

The directors of the Osceola Con. M. Co. report the operations of the company, including the operations of the Tamarack Jr. and Kearsarge mining companies, for the year ended Dec. 31, 1897: Gross receipts from sales of copper and other income, $1,338,056.11; total costs, $1,075,655.03; net income for year, $262,401.08.

During the year the following was spent for construction: Sinking No. 6 shaft, $34,746.63; engine and boiler house at No. 6 shaft, $29,593.04; rock house at No. 6 shaft, $10,116.01; sundry construction, $3704.39; total, $78,160.07.

The dividend statement from Nov. 15, 1878, to date shows total dividends paid amounting to $2,263,500. The superintendent's report says: "The levels north of No. 2 shaft in the Kearsarge have now sufficiently proven copper ground at such long distances from the shaft as to justify the sinking of a new shaft near the recently acquired Iroquois territory. I would recommend this work to commence as soon as possible. Largely increased compressor power has been contracted for during the year, and at this writing the machinery is nearly all on the ground and will soon be in place. In a general way it can be said that this end of the consolidated interest never looked more promising for good results than it does to-day. At the 31st level, south of No. 5 shaft in the Osceola, a crosscut for the purpose of testing the Calumet conglomerate has been drifted 243 feet. As the horizontal distance between the two lodes is about 700 feet, the probabilities are that about June 1 the conglomerate will be reached. This is a very important opening and may add materially to future prospects. Rock mined for the year, from all branches, 524,364 tons; rock stamped for the year, from all branches, 443,086 tons. The cost of stamping was 25.574 cents per ton. Mineral obtained for the year, from all branches, 13,957,373 lbs. At the stamp mill a tunnel is being drifted through the sandstone that will in future supply the entire pumping system with water. This will not only avoid the expensive maintenance and extension of bulkheads to keep an open section channel for the pumps, but will also give free scope for the deposition of sand along the entire frontage of the mill. The tunnel is 8x8 feet in section and will be wholly submerged when connected with the lake."

ONTARIO.

The Sandy Lake mine, near Dinorwic, is down 50 feet and the assays average $9 to the ton. The reef is said to have a witdh of 100 feet.

The Stella mine, near Portage, from a mill run of twenty tons gave a yield of $27.61 free milling gold per ton. The vein on the surface, traced for half a mile, is from 2 to 3 feet wide. The shaft is now down 65 feet. The company contemplates placing machinery.

COLORADO.

The Colorado Springs *Telegraph* says that the Kittie M. drifted on a new vein with such success that it is now shipping ten tons a day, the assays ranging from $20 to $244 per ton.

The monthly average of ore shipped from the Bachelor at Creede is 15,000 tons.

Production from the Anchoria-Leland at Cripple Creek holds at from 125 to 150 tons of smelting ore a week.

A tramway is in contemplation at Eldora to connect with all the principal mines of the district and deliver the ore for handling by the railroad when it reaches the camp.

The Antietam at Eldora is developed by a shaft 108 feet deep, at the bottom of which there is 4½ feet of shipping ore that will run from $60 to $70 to the ton. The mine is now being worked with a whim. A steam hoist will be installed in the spring.

The Revenge at Eldora made three shipments which ran $54, $112 and $96 per ton, respectively. The vein is 6 feet wide, with a pay streak averaging more than 1 foot in width of high-grade ore.

The Norway group at Eldora has opened an 8-foot body of ore that runs $35 to the ton.

The Mollie Maguire shaft, about 30 feet deep, has opened a 4-foot vein of sulphides, which gave assay values from $30 to $50.

Thirteen claims known as the Gold Cable group, San Miguel county, were sold to the Con. I. Co. of New York. About 1200 feet of development work has been done on the properties and several ore bodies have been uncovered. Mill runs returned $15 per ton and the concentrates will average $20 per ton.

The Lillie G. M. Co., Cripple Creek, has paid $45,000 in dividends and has a treasury reserve of $45,000, and in addition has between 500 and 600 tons of ore in transit.

A good strike is reported on the Kalamazoo, operated under bond for $75,000 by W. H. Reynolds of New York. The shaft is 500 feet deep.

The Modoc is producing large values. From the winze sunk from the 500-foot level the ore runs as high as 300 ounces, and a carload shipment returned 37 ounces gold and 29 ounces silver to the ton.

The Silver Wing proposition at Silverton, long idle, will be again in operation next month. The 1400-foot crosscut will be continued to cut the Denver lead.

The production for 1897 of the Strong was given at 18,000 tons, and its gross value $750,000. The Denver *Mining Record* says that it is now learned from a reliable source that the tonnage was greater and the value of the output was double the figures given. In the last six months of the old year the value of the ore shipped was over $1,000,000. Now the mine is sending to smelters and mills 175 tons each day. Of this, 100 tons runs in carload lots from $30 to $100 per ton. The ore comes from the north shoot, where the ore body is from 22 to 28 feet wide, in a shoot 250 feet in length. In the bottom level there are over 3000 tons of ore broken which cannot be raised, as the hoist is kept busy keeping the drifts at the 400-foot level free of ore and waste. If the present rate of production is maintained, the output for the year 1898 will not fall short of $3,000,000.

The Colorado Springs *Telegraph* says that the find in the Uinta tunnel at Victor is being followed up and steady production made. It is as fine a body of ore as has been exposed in Battle mountain in the last six months and is in a blind vein, or one that has not been opened up within 1500 feet of the tunnel. The strike is not in Portland ground, nor in a claim located prior to the date of the tunnel, and those who know say that under the recent tunnel decision of the United States Supreme Court the tunnel will have 1500 feet of the vein. It is reasonable to suppose that a fight for rights to the vein will be made by the owners of the surface ground, since the ore will not be gained without a fight, but it will make a clean-cut issue on the right of a tunnel to an undiscovered vein found in a claim that was located subsequent to it, but patented before the discovery was made by the tunnel. The conflict that will naturally arise is by far the most important one that has come since the tunnel question was settled by the courts.

The fight between the Uinta and the Portland, which is to come up in the courts in March, calls up again the question on which Judge Hallett recently rendered a decision in the suit of W. W. Stratton against the Gold Sovereign tunnel. That is, the right of way of a tunnel through ground located prior to the tunnel and patented before the bore reached its lines. The famous Rico-Aspen decision did not establish the right of a tunnel in such case. If Doyle is stopped from running the tunnel through the Lowell claim it will be impossible for the Uinta to be completed to the heart of the Portland group, or to reach the big veins that were opened after the tunnel was located, in which case he would be forced to stop work where the tunnel now is, under the injunction, and content himself with the big vein from which production is being made, granting, of course, that the courts allow him to retain it.

The Lonaconing on Beacon hill, after a temporary suspension, has been resumed. Returns from the last shipment gave a value of $62 a ton.

Recent development work on the Londonderry at Cripple Creek is of an encouraging nature. The shaft has attained a depth of 300 feet and bodies of low-grade ore have been cut in the shaft.

The Erickson on Gold hill is working on a 2-foot body of $75 ore in the 100-foot level and making occasional shipments.

Denver *Republican*: The strike made by crosscutting the west vein of the Geneva on Gold hill may make that property as heavy a producer as it was before the ore was lost by a former management. A shipment of seventy tons of the new rock was divided into two grades, one of six ounces and the other of ten ounces. The chute has been opened for 20 feet in length in the drift at 150 feet, and holds ore both ways.

A shipment of five tons from the old Bryant shaft on the Bogart returned $90 a ton.

The last car from the Birch netted $2083.46. It is estimated the lessees will clear $15,000 for January.

News Reporter: The Lost Canyon & Deep Tunnel M. Co., near Twin Lakes, has twenty-seven lode claims and 400 acres of placer ground. The lode claims have all been prospected and veins of gold-bearing rock uncovered on all of them. Assays have been made showing from one-half to six ounces gold to the ton. The company has a tunnel 300 feet, which as it extends will open all the lode veins. R. R. Foster is Gen. Mgr.

The Sedalia shaft at Leadville, which has reached the depth of 800 feet, will be sunk another level and drifts extended to catch the ore chutes coming from the upper levels. The mine has ore bodies in reserve in the levels above which have been drawn on very slightly, the policy of the management being to prosecute the work of development to the fullest extent and extract the ore at pleasure.

Reporter: The Pyrenees shaft has reached the depth of 1000 feet. An additional 80 feet of sinking and the shaft will be through the porphyry and into the lime formation, which will be 64 feet in thickness. When the lime is penetrated, the total depth of the shaft will be 1144 feet.

The Golden Eagle, at Telluride, shows a pay streak of 10 inches, running $75 in gold and seventeen ounces of silver.

The Congress mine, Red mountain, is shipping from fifteen to twenty tons per day.

NEW MEXICO.

The Old Abe mine, near White Oaks, is taking out ore sufficient to keep the stamps dropping as in the days before the shaft fell in. The company intends to put up a cyanide plant.

The South Homestake, at White Oaks, has been thoroughly prospected during the past two months with good results, and it is reported that this old-time producer went into the hands of Eastern parties on the 1st of March. The bin and many of the drifts are full of high-grade ore ready for the crusher.

J. M. De Kierscey is working four claims. On the Golden Dawn in Grant county he has a shaft 55 feet; the vein averages 6 inches and assays 1¾ ounces gold, 9 ounces silver and 8 per cent copper. A mill run gave returns of $14.65 per ton in gold on the plates.

The Confidence mine, owned by the Helen M. Co., is working seventy miners and producing 80 to 100 tons of ore per day, which is reduced at the company's 30-stamp mill at Whitewater. The new water-power plant is rapidly nearing completion. The pipe line to the mill is about 8000 feet in length. The company has in its own claims large bodies of a fair average grade in gold and silver.

J. P. McCarthy has bonded the Log Cabin mine, formerly known as the Alamo, for the Picher Lead Co. The mine is located about two miles from Central.

N. S. Berray has forty-five men employed on the Hanover mine, a producer of copper ore. The furnace is running steadily. There is an accumulation of nearly 1000 tons at the smelter.

The Othello and Desdemona mines in Grant county, belonging to the Kansas City Smelting and Refining Co. of El Paso, produced 10,800,000 pounds of lead and 81,500 ounces of silver in 1897.

Ashton & Roach purchased the Wild Cat mining claim, located on the western slope of Santa Rita mountain. There is a vein of copper ore on the property. Development work has been commenced.

The Santa Rita smelter, under the management of J. B. Gilchrist, is running steadily. A carload of black copper was shipped last week.

On the Booth mine six men are employed. At a depth of 48 feet they have a body of copper-iron ore 32 inches in width.

F. P. Jones is working the north end of the Romero mine, near Silver City, under lease. Twelve miners are employed and forty tons of copper ore per month is extracted, besides a lot of low-grade ore which can be concentrated. A large part of the ore produced and smelted last month ran 26 per cent copper.

The shaft of the Benton at Dolores is down 300 feet and the streak of from $75 to $100 ore at the bottom seems to be widening with every shot. They are also finding good ore in the drifts. They will ship three carloads of ore.

ARIZONA.

The Lehman group was sold last week for $35,000 to T. K. Lloyd and others of Salt Lake. The new owners will begin work immediately and will put up a 10-stamp mill. The mine is four miles northeast of Briggs and has a pay streak averaging $40 in gold to the ton.

L. R. Britton of Denver has bonded the Swallow group in the Castle Creek district. There are 800 feet of drifts and a shaft 200 feet in the mine. It is a copper camp, of the same character as the United Verde.

In the Dragoons, Cochise county, the Fitts Barrett Co. has a thirty-ton smelter in operation. The company has taken out a thousand tons of copper ore.

The Tennyson, fifty miles from Phœnix, is a free milling gold proposition, the development of which has encountered a 5-foot chute of ore returning $18 to the ton. The development consists of a shaft 78 feet deep and a tunnel 30 feet north of the shaft, tapping the ledge at 40 feet.

Work at the Golden States copper property, near Tombstone, is being pushed. The smelter, it is thought, will be ready to blow in March 10th. Twelve men are at work in the mine.

After a year's idleness the United Globe smelter was blown in last week. This marks a permanent revival of the copper industry of Globe. The large furnace in operation has a capacity of 150 tons.

The McCabe, in Yavapai county, has been well developed and has just begun to be a producer.

The ore body of the United Verde at Jerome has a width of 400 feet at the present depth of the mine, which is 500 feet. The ore carries considerable gold. Over $2,000,000 a month was the copper product of the mine last year. New smelters are to be added.

The Elkhart, in Chloride district, operated by the Security Mining and Development Co., owns sixteen claims. Two hundred feet has been reached and considerable drifting done. A stamp mill works over 100 tons daily. The Southwestern M. Co. has three shafts on the Schuylkill. Silver is high grade and lead is apparent.

A Denver company has bonded the Payroll and other openings owned by Judge Murphy. They will do extensive work at once on six claims.

The 20-stamp mill of the Senator M. Co., eighteen miles from Yuma, is crushing fifty tons of ore per day. The mine has reached a depth of 200 feet.

The Phœnix *Republican* says that the Fortuna is getting out $60,000 per month in gold. Five levels have been run, the deepest being 550 feet. A 20-stamp mill is operated. The Fortuna is fifteen miles south of Blaisdell.

The Ajo copper mine, in Pima county, is being developed and looking good.

The Jaynes mines in Yuma county are to be operated again. Twenty-five men are doing development work. The ore is to be treated by the cyanide process.

Forty miles south of Kingman a 15-stamp mill is operated by the Cedar Valley M. Co. on ore from the old Arnold mine.

MEXICO.

Mexico's gold production in 1897 was $6,800,000, as against $6,075,108 in 1896.

SOUTH AFRICA.

The following reports on South African mines are for January:

Wemmer: Crushed 6466 tons, yielding 4410 ounces; cyanide plant, 4375 tons treated, yielding 956 ounces, and from concentrates 157 tons caught, assaying 90 pennyweights per ton; total, 6072 ounces gold.

Van Ryn West: Number of stamps, 55; tons milled, 8710; number of ounces recovered, 3130; cyanide works, tons treated, 6720; number of ounces recovered 1333; total amount gold, 4463 ounces.

Robinson Randfontein: Stamps, 35; ore crushed, 5242; gold retorted, 2632 ounces; tailings (cyanide process), tons treated, 4410; gold recovered, 570 ounces; concentrates (cyanide process), tons treated, 48; gold recovered, 139 ounces; total gold recovered, 3341 ounces.

Langlaate Estate: Stamps running, 175; ore crushed, 22,195; gold retorted, 5754 ounces; tailings (cyanide process), tons treated, 14,850; gold recovered, 1472 ounces; concentrates (cyanide process), tons treated, 650; gold recovered, 1466 ounces; total gold recovered, 8692 ounces.

North Randfontein: Stamps running 40; ore crushed, 5856 tons; gold retorted, 1223 ounces; tailings (cyanide process), tons treated, 3840; gold recovered, 518 ounces; concentrates (cyanide process), tons treated, 105; gold recovered, 203 ounces; total gold recovered, 1944 ounces.

Porges Randfontein: Stamps running, 60; working days, 22; ore crushed, 6555 tons; gold retorted, 2807 ounces; tailings (cyanide process), tons treated, 4950; gold recovered, 714 ounces; concentrates (cyanide process), tons treated, 87; gold recovered 460 ounces; total gold recovered, 3981 ounces.

Ferreira: Crushed, 10,400 tons; bar gold extracted, 7914 ounces; concentrates caught, 240 tons; assay value of concentrates, 6 ounces fine gold per ton, equal to 1440 ounces; cyanide works, bullion produced from tailings, 2859 ounces; total gold from all sources, 12,213 ounces; profit from all sources, £27,775.

Rose Deep: Stamps working, 100; number of days, 29¾; tons crushed, 14,706; yield in smelted gold from mill, 5955 ounces; tons of sands and concentrates treated by cyanide works, 12,352; yield in smelted gold from cyanide works, 3711; total, 9666 ounces; estimated profit for month, £15,900.

Langlaate Star: Stamps running, 30; ore crushed, 5292 tons; gold retorted, 3097 ounces; tailings (cyanide process), tons treated, 4381; gold recovered, 934 ounces; total gold recovered, 4031 ounces.

Crown Deep: Stamps working, 180; number of days, 24 5-6; tons crushed, 22,082; smelted gold from mill, 6869 ounces; tons of sands and concentrates treated by cyanide works, 20,180; smelted gold from cyanide works, 6560 ounces; total, 13,429 ounces; estimated profit for month, £17,000.

During December,'97, the Jumpers mine produced gold to the value of £20,297. The profit for the month was £7194. One hundred stamps ran 29½ days, crushing 12,300 tons, which produced 3937 ounces of bullion. The gold produced from the tailings amounted to 993 ounces, and from the concentrates, 715 ounces. The working cost per ton, including mining, hauling, pumping, transport, milling and cyaniding, was £1 1s 4d. In January they crushed 11,500 tons; obtained from mill, 3902 ounces of gold; obtained from concentrates by cyanide, 505 ounces of gold; obtained from tailings from cyanide, 1000 ounces of gold; total, 5407 ounces of gold; profit for month, £6160.

AUSTRALIA.

At the Broken Hill Proprietary 24,571 tons of ore were crushed for the four weeks ending Feb. 3rd, and the output from the refinery was 3541 ounces of gold, 387,792 ounces of silver, 2238 tons of lead and 65 tons of antimonial lead, the copper matte containing 39 tons of copper and 34,584 ounces of silver.

Sampling Ore in Place.

At a recent meeting of the Colorado Scientific Society, in a discussion of "Sampling Ore in Place," J. A. Porter thought more errors are made in this work than in any other branch of the mining engineer's profession. Many cases in which great errors were committed have come to his personal knowledge. Too much care cannot be taken. As a rule, samples are neither sufficiently large nor sufficiently numerous, and instances are not wanting where the expenditure of half a million dollars depended on samples aggregating fifty or sixty pounds. When an ore body is to be sampled, all work in the mine should cease, and the examining engineer should have entire charge of the property. At least three independent samples should be taken, and they should involve tons, not pounds. Even in very homogeneous veins a sample should be taken every 10 feet of length and in gold mines nothing short of an actual mill run can be relied upon. He regards the sampling of an ore body as of more importance than the sampling operations on the results of which ore is sold, as the former usually involves the transfer of a much larger sum of money than the latter.

W. L. Austin cited a case in his experience in which the mine samples, though taken with the greatest care, gave persistently higher results than could be obtained at the mill. At the mine, samples were taken from the working faces in the stopes, and a hand sample was taken from every car of ore brought out of the mine. The results showed an average of about 100 ounces of silver. At the mill, the bullion returns, plus the tailings assays, showed only about forty odd ounces. Mr. Austin's explanation of the discrepancy is as follows: The valuable portions of the ore were chiefly chlorides, bromides and other extremely brittle minerals. The picking and gadding necessary in breaking down rock for the sample, jarred large quantities of these brittle materials out of the rock which was left in place, and these fell upon the cloth spread below, so that the engineer unconsciously "salted" his own sample. He thinks that the results of mine sampling with certain classes of ore, even when the work is carefully done, are almost invariably too high, and that small hand samples are, in many cases, comparatively worthless.

H. E. Wood believed hand samples, properly taken by a person who understood such work, to be perfectly reliable. He thought that the expense attached to the method of sampling suggested by Mr. Porter would be prohibitory in very many instances.

E. Le Neve Foster said this is the most difficult work we have to do. The general experience is that estimates based on samples far exceed the results obtained in the subsequent working of the mines. The engineer frequently deceives himself. In attempting to include a fair proportion of the more valuable ore, he often gets too much. In silver ores the most brittle portions are the richest, and, in sampling, we are very likely to get too large a proportion of this material in spite of the great care exercised. I think it is necessary to break at least 100 pounds of ore at each place where a sample is taken, and then quarter this down to a convenient amount. In estimating the value of a mine which has been worked to a considerable extent, the safest plan is to base the estimate on previous sales of ore. Even this method must be used with some caution, as it is very probable that the richer portions of the vein have been worked out, and the poorer ore left.

H. A. Vezin thought that there is no difficulty in making sufficiently accurate samples of ore in a mine if the examiner will only take the trouble to follow a simple system, consisting of purely mechanical methods, instead of using what he is pleased to call his judgment, which generally consists in picking out a sample by judging of its value by the eye. He agreed with Mr. Porter that the trouble lies in the sampling improperly done. When a slice is taken at any one point it should be deep enough to take as much of the hard as of the soft, and these slices should be taken at sufficiently short intervals and in sufficiently large number.

In one case he cited the sampling of a mine from which good results had been expected. His assays of ore that had been brought to the smelting works for treatment, gave such low assays that his ability as an assayer was seriously called into question, the value being scarcely one-half of the estimates previously made, all of which were based upon the results obtained from treating several hundred tons of ore. The mining captain, a very careful man, was ordered to take samples of the vein, and he brought ten of these as the result of about five or six hours' work. Mr. Vezin objected to the method employed, but was told by the manager, who did not consider that his opinion, he being merely the assayer, could be of much value, that what he required in sampling the vein would make each sample cost $60. He thinks that $6 would have been more than enough, but, assuming even that the other estimate was correct, the total expenditure would have been $600, and it would have resulted in saving the subsequent expenditure of $600,000, besides avoiding a great deal of heartburning and bitter disappointment. The result from these ten samples showed a value more than twice as great as that which the ore yielded when treated in the works.

The second example was that of a mine opened up by 500 to 800 feet of drifts and winzes, which was to be examined by the metallurgist who expected to smelt the ore. Wishing to make the examination on the way from one mining town to another—a distance of about sixteen miles, with a high ridge between—and complete the investigation all in one day, he took all the samples, when Mr. Vezin made the map of all the openings. The result obtained by the metallurgist was thirty ounces of silver to the ton as the average. Later, when he had partly completed the smelting works, and brought down lots of twenty and fifty tons of ore, he found that it uniformly contained eleven ounces to the ton, and then admitted that he had made the mistake of simply taking the average of his samples, to which may be added that he did not take enough at each place.

In Mr. Kirby's interesting article on sampling at mines, published in the MINING AND SCIENTIFIC PRESS three years ago, the weight or influence of a few samples is, Mr. Vezin thinks, much too far-reaching. Adapting some of Mr. Kirby's rules, as he remembers them, to the ore bodies in Leadville, the result can only be disastrous, as was the case when a distinguished mining expert was examining a mine for intending purchasers in the East. Taking the map as made by Mr. Vezin at that time, and then drawing lines across as limiting probable ore chutes, determined by the thickness of the ore at two points far apart, cutting down this thickness to one-half or a quarter, and assuming the value much less than he supposed he had found, then measuring the surface of the chute "by the acre," he obtained a value of ore in sight three or four times as great as that which was afterwards taken out up to the time when the mine was exhausted.

In examining some mines in southwestern New Mexico, Mr. Vezin followed the simple method of taking sufficiently thick slices from the vein at regular intervals. The ore was very hard quartz, with gold and silver distributed irregularly through it. The samples had to be broken up by handhammers and gradually reduced. The quantities taken were very much smaller than those suggested by Mr. Porter, and the result was so close that nobody ever found more in the vein after Mr. Vezin had made the examination, though his result was less than one-half of what anybody else had found before. He was able, with two miners, to take and reduce in quantity three or four samples per day. The average was about $20.30 per ton. As a precaution against salting, the rejected portions of the samples were thrown together, each one being measured by the number of shovelfuls, as there was no means of weighing the same. These portions were mixed, cut down, crushed, the average value of the same determined by calculation and the sample of the whole lot assayed. The assayer's return gave a value of $17.80, while by calculation with the crude method of measurement adopted, the average was $21.60. The arithmetical mean of the values of the samples, of which there were ten, was $20.60, or nearly exactly the same as the value of the calculation. Owing to the nature of the ore, it is quite likely that $21.60 was much nearer to the true value than the return by the assayer of the sample of all the rejected portions. A re-assay of this might give a somewhat different result. The main thing is, that his return showed that there could have been no salting of any of the samples. These results, of course, do not necessarily show the average value of the vein, since the thickness of the same, which varies from 14 to 44 inches, was not brought into the calculation in the rejected portions. That the average of the vein and the value of the rejected portions should be so nearly alike is purely accidental.

Mr. Vezin does not think that it requires any extraordinary intelligence or skill to obtain approximately correct samples. Any handy man can be taught how to do so, and in a few lessons. All it requires is care and patience.

To Test the Purity of Water.

As it is sometimes necessary to know the ingredients of water used, a few simple methods for testing its purity are given:

To know whether water is hard or soft, dissolve a little white soap in alcohol and add a few drops of water under investigation. If the alcohol turns milky, the water is hard; if either unaltered or simply cloudy, it is soft.

To detect a copper percentage, add a little filing dust of soft iron to the water, leave it in for a few minutes and add a few drops of sal ammoniac. A blue colorization betrays the presence of copper.

For detecting carbonic acid, a small quantity of water is mixed with a like quantity of lime water. If carbonic acid is present, the fluid turns milky at once. Hydrochloric acid causes the turbidity to disappear.

Sulphur combinations are detected by adding a little water to the mercury in the bottle; this is closed and left to stand for a few hours. If the mercury assumes a darker surface, and, upon shaking, separates into grey powder, it is a sign that the water contains sulphur combinations.

Dissolved pure lime is proved by adding one or two crystals of oxalic acid to the water. A milky preparation betrays the presence of lime.

Sulphate of lime (gypsum) is recognized by the white precipitate caused by chloride of barium in the solution. The precipitate is not redissolved by nitric acid.

Alkalies and alkaline earths are detected as follows: Blue litmus paper is colored feebly red in dilute vinegar and dipped in the corresponding water. If the former blue color is restored, the water is alkaline.

An iron percentage is recognized by a few drops of nutgall decoction, which are added to the water. If iron is present, the water assumes an inky grey to black color. Also one drop of solution of ferro-cyanide of potassium colors ferruginous water blue.

Acids are ascertained by dipping a small piece of litmus paper in the water. A red colorization betrays their presence.

IF one has a pattern made of soft pine put together with nails, an iron casting made from it will weigh sixteen pounds to every pound of the pattern. If the casting is of brass, it will weigh eighteen pounds to every pound of the pattern. A metal that will expand in cooling is made of nine parts lead, two parts antimony, and one part bismuth. This metal will be found very valuable in filling holes in castings.

Electricity at the Transmississippi Exposition.

It is to be regretted that central and northern California are not to be appropriately represented at the Omaha Exposition. Southern California has made suitable provision therefor, and will be benefited thereby.

The electrical exhibit at the Transmississippi Exposition will be of unusual interest and value, showing the practical progress made in electrical science as applied to the uses of commerce, industry, mechanics, and the household, showing the highest achievements attained in that line.

T. A. Edison is now preparing an Edisonian exhibit at Orange, N. J., for the exposition, embracing a series of inventions and practical applications of known principles to the reclaiming of the iron in low-grade magnetic ores, and the treatment of gold and silver ores of low grade. The system of vacuum tube lighting will be demonstrated. While electricity is a source of heat, this is the nearest approach to the solution of the problem of light without heat.

Lieut. Squier will exhibit his syncronograph, by the aid of which the operator can transmit the contents of an ordinary newspaper inside of an hour's time.

The recently discovered appliances for the use of the army will be shown, including the system of military telephones which is calculated to aid the commanding general who directs the operation of an army corps in a future battle. By means of this apparatus, it will be possible to string a line of wire from point to point of an army's communications, and use the same wire for both telephoning and telegraphing. General Greely has declared it to be the most scientific advance of the year, the importance of which is not confined to military work alone, but may be applied the world over. The whole outfit weighs only sixteen pounds, including battery enough to work over any length of line that the corps would probably be called upon to operate. An operator may, therefore, easily carry in his hand a combination telegraph and telephone office. With it, while one operator is engaged in telegraphing a message in Morse characters, another may, over the same wire, talk telephonically with another station, the distant operators hearing only their own messages.

Telegraphing at sea without wires will be practically demonstrated by means of the apparatus of Marconi, the Italian electrician, who claims to be the inventor of the wireless telegraphy. The singular feature of this method of telegraphing is shown by a wire extended vertically in the air, connected to a radiator on the ground. Messages without wires have been sent a distance of twelve miles to a ship at sea. By simply increasing the height of the vertical wire the influence of the machine can be extended over a distance augmenting in geometrical ratio to the increased height of the wire.

The third-rail system will be exemplified by a working exhibit consisting of a line of railway 137 feet in length. By means of a third rail more safety in electric railroad and trolley travel is said to be assured. Cars operated by this system can be reversed under full headway, even on grades and curves, or they may be stopped within one-half of their length. It is considered entirely feasible under this system to attain a speed of a mile a minute or sixty miles an hour. The cars in this system carry beneath the seats a series of small storage batteries supplied from the feed current.

Horseless carriages, cabs and vehicles of all sorts, electric fire engines, trolley records, electric saddle pads for horse racing, electric lamps, day and night car signs, use of electricity in mills, offices, and for up-to-date cooking, heat and light, will serve to show the possibilities and limitations of one of the mightiest natural forces of the earth.

Butte and Anaconda, Montana.

Butte, Montana, is the largest and busiest metal mining center on the continent. It has occupied for some years the same position that Virginia City, Nevada, assumed from 1871 to 1880. Water, fuel and transportation are abundantly supplied, copper, next in demand to gold, is the chief product, and Butte has the present rare distinction of possessing silver mines that pay dividends—of course, largely as a "by-product."

About 5000 men are employed in and about the mines of Butte; the daily output of ore is 7000 tons. On this and the opposite page are depicted from the columns of Butte's mining paper, the Butte *Miner*, scenes familiar to many mining men. Interior views are shown of the Anaconda smelters, which employ nearly 2000 men. The Anaconda group of mines gives an average daily output of 3600 tons, which is treated in the company's smelters at Anaconda, twenty-seven miles from Butte, transported there by the trainload. The largest locomotive in that region lets the loaded cars down on the hill line from the mines to Rocker, and other locomotives there haul them to Anaconda. The smelting plants are complete, the refinery alone costing $1,500,000. The entire plant cost nearly $10,000,000, and consumes 400 cords of word and as many tons of coal every twenty-four hours.

With a few exceptions, the mining companies operating in Butte refine their own product. This branch of the mining industry was established a few years ago, after the magnitude of the mines had been fully established. The Parrot was first to add a refinery to its plant. Besides the gold and silver output, the latter company produced 16,000,000 pounds copper in '97.

FURNACES IN SMELTING WORKS AT ANACONDA, MONTANA.

The Desert Mines.

Stretching northward from the Sierra Madre range, and occupying the entire northern portion of Los Angeles and San Bernardino counties, and the southeastern portion of Kern, Riverside and San Diego counties, is the extensive region popularly called in southern California the "Desert." In distinct contrast to the fertile southwest corner of the State, it is an area of isolated, barren mountain ranges, approached for the most part by long washes which, in some of the ranges, run almost to the summit. Each range is separated from its neighbor by greasewood-covered valleys, dotted with dry lakes on whose alkaline surface not even a salt weed can grow. Water is scarce, but the quality generally very fair, except in the neighborhood of the saline lakes, where it is somewhat brackish. There is no fuel of any value, except the occasional clumps of mesquite and willow found on the banks of the Mohave and Amargoza rivers, and the yucca, of which patches are scattered at wide intervals. "Sandy" is the answer whenever one asks what sort of road there is to any point on the desert, and wide-tired wagons are the only type suitable for desert travel, and the patient and hardy mule is found to be best suited to the long journeys.

It is only to be expected that the development of mines under the difficulties imposed by remoteness from railway transportation, scanty water and fuel supply, and poor roads should be a slow and expensive process; and if we add to these difficulties that of at times extreme heat, we can give due credit to the men whose energy and persistence have enabled the desert to make such a good showing as a mineral region.

The rapid development of the Rand district is familiar to every one interested in mining, and the work so far done has shone that an extensive mineral zone exists there, so that although there will be places and workings where the veins will pitch and apparently disappear, further exploration can be undertaken with a reasonable certainty of picking up the vein, as is the case with most of the mother lode mines in Amador and Calaveras counties.

The Golden Cross at Hedges, sixteen miles from Yuma, is a good example of what can be accomplished in surmounting natural difficulties. The mine is in the side of a high, barren mountain, not a drop of water in sight, and to all appearances not enough wood to cook a dinner. Yet capital, backed by lots of pluck and faith, has made it a productive section. The company owns its own pipe line, eleven miles long, and its own pumping plant on the Colorado river; and fuel, though scarce, has so far been obtained within fourteen miles of the mine in sufficient quantities to run a 70-stamp mill.

The mineral wealth of the desert region does not lie entirely in the precious metals. An extensive copper deposit is being developed at Pilot Peak, thirty-five miles northeast of Daggett, on the Santa Fe line, and in the Resting Springs district, just across the north line of San Bernardino county, in Inyo, are the Noonday and Gunsight lead properties, well developed and ready for work as soon as railway transportation shall enable them to sell their product to smelters at a profit. This region, which lies near the east arm of the Amargosa river, was worked early in the 70's, when everything had to be transported from Newport landing by mule teams. It took two weeks to haul the base bullion to the coast, yet, with silver at $1.29, the mines paid dividends for some time. In the same district are many other lead properties and rich silver-lead properties which could be made to pay even now if a railroad could be brought within twenty miles of them. Besides these, there are extensive deposits of rock salt and nitre in this district awaiting cheap transportation, and from present indications it will not be long before they get it. Mines of this character are a greater inducement for a rail-

road than gold or silver mines, because while the precious metal mines furnish some outgoing freight, yet there is very little return freight. Lead, copper, borax, salt and other minerals of like character have return freight for a railroad, and hence are more profitable to it. As to the character of the gold and silver veins in that region, the prevailing opinion, based on experience of the Amargosa, Ibex, Confidence and some other mines less developed, seems to be that the veins, although not generally over 4 feet wide, are fairly continuous, and carry good value. Several fortunes have to be hauled to the rivers for treatment, and where electric power is impracticable gasoline seems at present to be the best solution of the power problem, and when intelligently manufactured by experienced mechanics and operated with reasonable care gives, within its limits, the most economical results obtainable outside of electric power.

In brief, the power problem and that of cheap transportation are the ones to be solved in developing a paying property on the desert. There, as elsewhere, ledges are found in the most unexpected places, and the successful

UNDERGROUND SCENES IN BUTTE, MONTANA, MINES.

The upper left hand corner shows men inspecting the mine 1500 feet under ground—The upper right hand corner shows the face of a drift 1000 feet below the surface—In the wer left hand corner is a scene at lunch time on the 1500 level—In the center below are two men discussing outside affairs on the 1000 level—At the right is the diamond drill at ork 1200 feet below the surface.

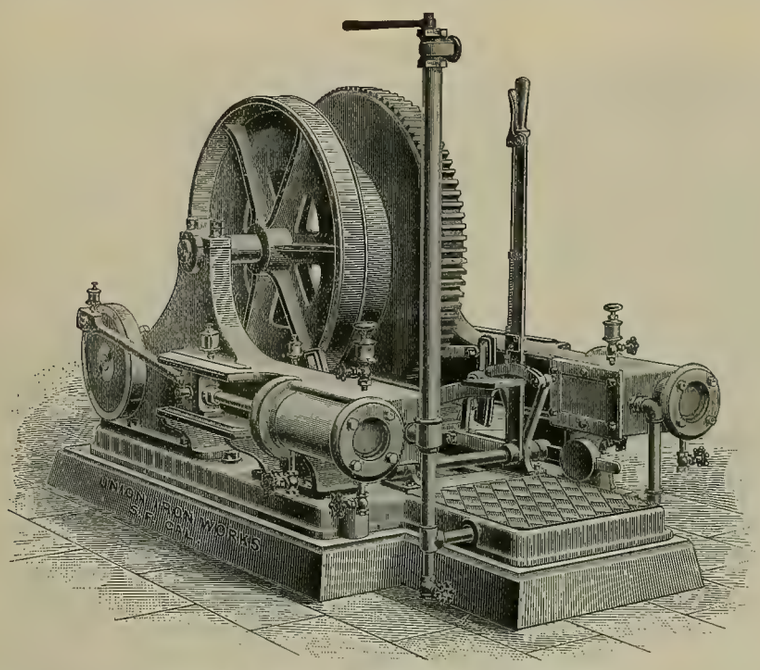
re said to have been made from the margosa, yet its deepest known workgs are not below 70 feet. The Ibex, tuated in the Argus range on the ast side of Death valley, is said to ave paid even with wood at $40 a ord. But it can be stated as a gen·al proposition that in this district, s in most others on the desert, gasoe or other condensed fuel must necsarily come into use for continuous ork. The wood supply is scanty and idely scattered, and the water generly very injurious to boilers. With ailway facilities it is probable that ithin certain distances fixed by elecical conditions in each particular case ectric power generated at central ations along the railway can be used ith economy. Concentrating ores will prospector must needs work closely and carefully. The country, being open and free from brush, is easy to examine, and anyone who has traveled the desert sufficiently to know where to find water when he needs it can travel through the country with safety, even in summer.

If the supervisors of the counties containing desert lands could only be induced to sink artesian wells, instead of the present dry lake wells, and erect proper tanks and pumps over the same when dug, travel over the desert would be relieved of the great inconvenience of "foul" wells, and the lot of the traveler on the main roads would be pleasanter. But these matters will, no doubt, be rectified in due time. Franklin Booth in Los Angeles Review.

Good Foundry Practice.

Mr. E. J. Baker of the Northwestern Wire Mattress Company, Kenosha, Wis., in the February number of *The Foundry* gives the following account of the foundry practice at that establishment:

"The time of melting and the dimensions of our cupola also vary from established practice. Our cupola is a Whiting No. 2½, 41-inch shell, height of charging door from tap hole 9 feet 6 inches, number of tuyeres six, two lower and four upper; lower tuyeres are 18 inches from the bottom, while the upper tuyeres are placed 15 inches higher. The cupola is lined with two course of brick, and an additional lining of sand, rammed firmly around a tapered plug 14 inches at bottom and 17 inches at top. Our object in lining the cupola to such a small diameter is to save coke, and is also made necessary by the fact that we need a steady quantity of iron throughout the day, instead of a larger amount in a few hours. We have no set quantity to melt, as changing conditions, frequently occurring throughout the day, have to be met by a corresponding change in the cupola practice. The class of work we manufacture is small chill castings, the largest not exceeding four pounds weight. As all the iron is taken away in hand ladles, holding from thirty to thirty-five pounds, and has to be carried up to about 90 feet from the cupola, it is an all-important point that the iron shall be hot, as it must be poured very slowly.



"Our practice is to start the fire in the cupola at 4:30 A. M., with from 250 to 300 pounds of coke on the bed, on which is charged from 100 to 125 pounds of pig and 300 pounds of scrap. The blower is started at 6:30 A. M., the following charges being made up of 30 pounds coke, 100 to 125 pounds pig and and 400 pounds scrap, with from 15 to 25 pounds of limestone to each charge. The slag is removed, as fast as accumulated, through the slag hole, which is kept open all day. At noon the tap hole is knocked out large enough to allow the remaining slag to be blown off, when the cupola is filled up with coke, from 250 to 300 pounds being required to put it in condition to receive the first charge following the noon hour, after which the practice of charging is the same as already explained of the forenoon. We melt until 6 P. M., when, instead of dropping the bottom, as is usual, we knock out the breast, which is built of coke and sand, having a plate and strap to hold it in position. This part of our practice becomes necessary owing to the small diameter of the cupola. The sand bottom is heavy and built steep so as to run the iron directly to the tapping hole."

★ ★ 222 Market Street, San Francisco, Cal. ★ ★

MAKE THIS SMALL

DOUBLE CYLINDER SINGLE DRUM HOIST

HOIST FOR PROSPECTING.

For Prospecting Purposes or Underground Work,

USING COMPRESSED AIR.

The entire hoist is self-contained, being mounted on an iron sole plate or bed which carries all the operating levers and provides a footboard for the operator. The engines are provided with reversible link motion and the drum with a broad strap brake, insuring safe and rapid work.

The general lines upon which this hoist is designed are neat, strong and substantial and all the operating parts are conveniently arranged.

The size herewith illustrated is the 4 in. x 10 in., rated at 15 horse power. The larger sizes, 8 in. x 12 in. and upwards are provided with post brakes.

GOLD IN COLORADO!

Colorado has within its limits some of the greatest gold mines that has ever been discovered. In Cripple Creek in 1892 there were a few prospectors looking over the hills; in 1895 the camp turned out over $8,000,000 in gold. Leadville, the old bonanza camp and the mineral product of which made Denver what it is to-day, is becoming a big producer of gold. New inventions for working low-grade gold ores, together with the discoveries made to work rebellious ores, have opened up a field for the miners such as they have never enjoyed before, and Colorado has inducements to offer such as no other district in the world possesses; the record of the State in gold production for the last three years speaks for itself. Among the other prominent camps in the State are Telluride, Ophir, Rico, Silverton, Mineral Point, Durango, La Plata, Ouray, Saw Pit, Ironton, the Gunnison district and many others. New finds are being made and new camps are springing into existence every day. The Denver & Rio Grande Railroad, which is the pioneer road of Colorado and which has always been the miner's friend, reaches all the mining camps in Colorado. For elegantly illustrated descriptive books, free, of mines in Colorado send to

PATENTS

DEWEY, STRONG & CO'S PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & CO.'S Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

30 and 32 FREMONT ST., SAN FRANCISCO.

Spadone's Concentrator Belts. Patented.

The "SPADONE" Curved Edge Concentrator Belt is attracting much attention among mining men, its merits appealing to the millman of practical experience.

Illustration (Fig. 1.) shows a cross-section, and (Fig. 2.) shows the edge flanging outwardly as it passes over the pulley. This relieves the strain from the top and bottom of the edge by directing the strain automatically to the inside face surface of the edges. Heretofore all belts have been so constructed that when they pass over the pulleys or rolls, a direct strain comes upon the top or at the base of the edges, causing the edges to break away from the body of the belts in a very short time. *We avoid this Mechanical Defect by our Spadone Curved Edge.* Belts made to fit any machine—4, 5 and 6 feet wide. Prices and samples on application.

FIG. 1.

FIG. 2.

We shall be pleased to quote you also on Water, Air Drill, Steam, Suction and Fire HOSE, RUBBER BELTING and RUBBER PACKING. Correspondence Solicited.

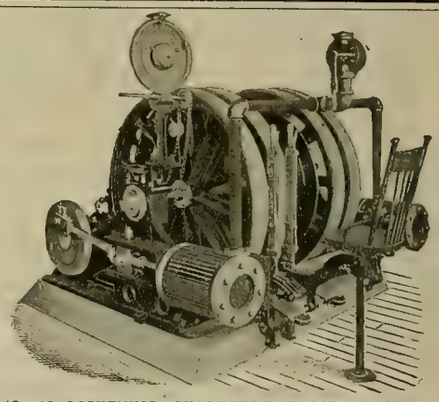
"KEEP YOUR EYE ON THE INDICATOR."



Patented March 28, 1893.

The Bolthoff Automatic Signal Alarm Indicator.

HUNDREDS NOW IN USE. UNIVERSALLY RECOMMENDED.

It is without question the most accurate indicator for hoisting engines ever constructed. Not only is there no lost motion, but it has the valuable feature of a device whereby automatically the approach to station, curves in the shaft, bad places, obstructions, or, in fact, if for any reason the engineer desires to be warned of the approach of the cage or bucket to any particular point in his shaft, either in hoisting or lowering, he can set it so that the signal bell will automatically sound its alarm.

VULCAN ROPEWAY

—WITH—

AUTOMATIC ORE LOADER AND AUTOMATIC DUMPING DEVICE.

For Conveying Ore, Cordwood, Etc.

EMPIRE, NEVADA, April 17, 1896.

Vulcan Iron Works.—GENTLEMEN: The Ropeway furnished by your company to convey tailings from Morgan Mill to Mexican Mill, a distance of seven-eighths of a mile, is giving entire satisfaction. We transport 200 tons of tailings in ten hours; one man does the whole business, including elevating tailings from hopper in the ground, operating Vulcan self-loader, and attending to the Ropeway generally. The self dumper requires no attention whatever. The Vulcan loader I consider the best feature in the whole Ropeway, making it possible for one man to load 200 tons in ten hours.

Yours very truly, J. P. WOODBURY, Supt.

308-312 REQUENA ST., LOS ANGELES, CAL.

Market Reports.

The Markets.

SAN FRANCISCO, March 3, 1898.

Jobbers report that trade outside of the demand for outfitters for Alaska and the Northwest Territory does not show any improvement over the corresponding time in 1897. They say that the buying by retail distributors is on conservative lines which necessitate almost constant sorting up. It is expected that the call from the more favored farming and fruit sections will show a steady increase from now on until towards the close of harvest. The higher temperature will make easier travel and prospecting in the more remote mining districts. It will cause more general activity in all other districts; this will cause free buying of goods of all description. The ship and steamboat building yards are running to full capacity on vessels adapted to the Alaska service. This calls for more hands and also for machinery. The foundries and machine works are busier than at this time in 1897, with the outlook favorable for continued activity. The Government's calling for powder is causing one of the factories to run full time and full-handed on smokeless and black powder.

The local money market is practically unchanged. The banks report continued accumulation of idle money, yet while they extend accommodations to patrons they are not disposed to put out money outside of this unless on best approved security. Steady exporting of grain on which advances have been made is untying considerable money each week which is going into the general reservoirs. It looks now as if considerable more money will be employed this year for crop purposes owing to the outlook being favorable for an outturn of fruits fully one-third larger than ever before, of sugar beets in excess of last year and more wheat than in 1897. The increase will be still greater if we have the usual spring rains, particularly in the southern part of the State. The closer money market at New York seems to have given way to ease. This change is due to fears of war having subsided and also to gold being drawn from Europe. The ease at the East is reflected in higher market values for American securities.

New York Silver Prices.

NEW YORK, March 3.—Following are the closing prices for the week:

	Silver in— London.	N. Y.
Friday	25⅝	55⅝
Saturday	25⅝	55¼
Monday	25½	55¼
Tuesday	25½	55
Wednesday	25⅜	54½
Thursday	25	54

	Copper.	Lead.	Iron.	Tin.
Fri.	11 40 @11 60	3 80	9 75@12 00	14 15
Sat.	11 62½@11 75	3 80	9 75@12 00	14 15
Mon.	11 75 @12 00	3 75	9 75@12 00	14 20
Tue.	11 80 @12 00	3 75	....@....	14 20
Wed.	11 85 @12 00	3 72½	9 75@12 00	14 17½
Thur.	11 85 @12 00	3 75	9 75@12 00	14 15

The local bullion, money and exchange quotations current are as follows:

Commercial Loans, % per annum	6
Commercial Loans, prime	5
Call Loans, gilt edged	4@4½
Call Loans mixed securities	5@6
Mortgages prime, taxes paid by lender	6@8
New York Sight Draft	17½ Prem
New York Telegraphic Transfer	20c Prem
London Bankers' 60 days	$4.82¾
London Merchants	$4.81½
London Sight Bankers	$4.85½
Refined Silver, per oz., 1000 fine	.54
Mexican Dollars nominal	46@—

SILVER.—The market has sold down throughout the week with a weak closing as if still lower figures will be touched. Some of the bankers informed on the market look for a 50 cent price, if not less. This low figure will cause many mines to close down, but this may be offset by an increased outturn by copper mines owing to the high and strong markets for copper stimulating the production. Russia has for the present, at any rate, had her silver wants met and with that government not buying supplies necessarily increase in the absence of a corresponding increased call from any other source. Shipments of silver from Atlantic seaports to Europe are quite heavy and unless placed before being exported must have an unfavorable influence. The steamer hence February 25th took out $104,000 in bullion.

MEXICAN DOLLARS.—The market is stagnant and quotations entirely nominal owing to the decline in silver. The last steamer hence for China took out $30,327 worth. This is a light shipment.

COPPER.—The markets have advanced quite rapidly the past week, closing strong at the East and in Europe, with the tendency to still better figures. The advance confirms the position taken by the MINING AND SCIENTIFIC PRESS as early as December of last year. The ending of the engineers' strike in London brought in a large amount of deferred work calling for copper, which, with increased requirements of nearly every nation abroad for war-footing purposes, have run the stocks abroad to low figures, and this, too, in the face of increased shipments from the Atlantic seaports. The consumption in the United States is on a much larger scale, also, which aids very materially in depleting available supplies. If the markets should advance another cent and show signs of holding, many of the idle and more expensive mines will start up. Imports the past week were 1284 ingots from Seattle.

Our market is quoted as follows:

Ingot casting, jobbing	13⅛@—
Ingot " wholesale	13 @—
Sheet copper	16¾@—
Bolt	¼ and 5-16, 20c; ⅜ and larger, 16½

TIN.—The stronger markets at the East were only temporary, for with no speculative demand more urgent trade wants were met, when an easier tone was noted.

The market is quoted in jobbing lots as follows:

Pig	4 75	@	5 00
Sheet	....	@	6 50
Pipe	5 30	@	5 80

LEAD.—Our market is quiet and easy. The East reports dull markets, but at the decline smelters are not pressing for sales. Our Eastern exchanges look for an active consumption.

Pig, per lb., jobbing	—@ 15
Plate, I C coke, heavy, per box	$4 10@4 25
" " " light, "	4 00@—

SHOT.—Our market is quoted as follows:

Drop, sizes smaller than B, per bag of 25 lbs	$1 35
Drop, B and larger sizes, " "	1 60
Buck, Balls and Chilled, do, " "	1 60

QUICKSILVER.—The market is firm at an advance. The last steamer for Mexico took out 50 flasks.

Our market is quoted at $40 for domestic consumption and $38@37 for export to the west coast of Mexico.

IRON.—The market is about the same as it has been for some time past. The consumption shows a slight increase. The East reports dull markets, with quotations easier for buyers.

COAL.—The consumption of both steam and house shows quite a falling off, and as receipts are good, with considerable to arrive, the market is in favor of buyers of round lots. Receipts of coal for the week ending with Tuesday were as follows in tons: Comox, 2400; Puget Sound, 12,351; Newcastle, N. S. W., 4282; Coquille river, 75; Philadelphia, 1950; Coos Bay, 615. Total, 21,673 tons.

POWDER.—The Santa Cruz factory is running largely on Government orders. Our market for mining is strong, with the demand improving.

The market is quoted as follows for Hercules: No. 1, from 11¾c to 17¼c, according to strength and quantity; No. 2, from 9c to 11c, according to strength and quantity.

PLATINUM.—The market is steady. Our market is quoted in a jobbing way at $16 per ounce and for scrap $11 per ounce.

ZINC.—The market is steady. Our market is quoted at 10@15c, according to thickness.

ALUMINUM.—The market is steady. We quote in jobbing lots at 45@50c per pound for ingots.

BORAX.—Continued free exporting by rail to the East is reported. There was shipped by water 200 tons to New York, where the market is strong, with supplies light.

The market is quoted as follows:

Refined, in carload lots, in barrels	7
Refined, in carload lots in sacks	6¾
Powdered, in car lots	7
Concentrated, "	6¼

Chemicals.

The market is in about the same condition as it has been for several months past, although a slightly improved call is reported from consumers. At the East nothing new comes to hand. The demand there is said to be quiet in all lines, except nitrate of soda, which fluctuates daily in price.

CYANIDE OF POTASSIUM.—The market is steady. Our market is quoted for chemical pure, 32 cents per pound for jobbing lots, and 29 cents for carloads.

SULPHURIC ACID.—The market is firm. We quote in a jobbing way at 1½c per lb. for 66%.

ACETIC ACID.—The market is firm at 6 to 12c per pound from store for carboys, according to make.

NITRIC ACID.—Our market is reported steady from store at 6½@7c per pound in carboys.

BONEASH.—There is a good demand for export. Our market is quoted in a jobbing way as follows: Extra, 4c a pound; No. 1, 3½c; No. 2, 2½c.

BLUE VITRIOL.—Our market is steady. We quote in a jobbing way at 4c per pound.

SPELTER.—The market is steady. We quote our market in a jobbing way at 5c per pound.

BISMUTH.—The market is firm. Our market is quoted in a jobbing way at $1.40 a pound.

SODA ASH, 58% (Le Blanc process).—The market is steady at $1.55 per 100 lbs. in a jobbing way.

CAUSTIC SODA, 60%.—The market is steady at 3c per pound in a jobbing way.

HYPOSULPHATE OF SODA.—The market is quiet at 2½c a pound from stores.

NITRATE OF SODA.—The market is about the same as it has been for a month past. Our market is quoted from store at 4c for 95%.

PHOSPHORUS.—The market is steady. We quote in a jobbing way at 70 to 75 cents per pound.

Mining Share Market.

SAN FRANCISCO, March 3, 1898.

The market has been stale, flat and unprofitable to all except the inside pool, which, if indications and reports are correct, has been taking in about all the shares thrown out by disgusted holders and many of those sold by persons that have gone or are going to Alaska and the Northwest Territory. There is nothing allowed to leak out from the mines which is calculated to excite the cupidity of outsiders into buying, but it seems as if a contrary policy is being pursued, so as to make them sell. There are some outsiders who have been quite successful in their operations on 'Change that have been quietly picking up shares at the low ruling prices. Their experience has proven correct—that, to beat the game, is to buy when such shares as Ophir, Mexican, Union, Best & Belcher, Gould & Curry, Challar, Potosi, Yellow Jacket, Crown Point and Belcher sell at such absurd low prices as they are at present. They claim that, even with another assessment added, they are still cheap, and that experience in the market has taught them that before three or four months pass quite a good-sized profit is realized from the investment. They say that in no other way can a larger return be had from the money they put in them. They also state that the market has been "sat on" for over a year, and, under assessments, scare reports and a low-dragging policy, only relieved by short-lived rallies, the outside public have sold the most of their holdings. If these views are correct, and they appear to be reasonable, then an up-move can be looked for when the line of assessments that is being put on is off. The writer has yet to see the market fail to recover from such a long drag and almost continuous assessing. If there was no certainty of its not going up again, and on ore finds, too, John W. Mackay, D. O. Mills, Col. Hayward and others who ought to know what there is in the Comstock lode would sell out their holdings—railroads, mills, water franchises, etc., not to say holdings in a pool of lines of shares. It is the current belief on the street, grounded on the past, that no outsider can get control of any of the more desirable mines, particularly those that hold the key to the underground workings. The more important work in Sierra Nevada is delayed by moving the ore dumps from the upper to the lower tunnel. Some claim they will develop quite a body of ore. Standard, in the Bodie district, has declared a 10-cent dividend.

From the Comstock mines "grape vine" telegrams of a bullish nature are as scarce as inside information. There seems to be always a scarcity of news when the market is dragging around bottom, but there is no lack of discouraging news. They are driving ahead in the northwest drift in Utah, with no change of formation reported. In Sierra Nevada they are making a two-compartment raise from the tunnel level, which indicates that more ore has been found in the upraise than had been expected. They are driving the Riley tunnel ahead. They are extracting a few tons of ore while upraising. On the 900-foot level there is no change in the work or formation. In east crosscut No. 2, 900-foot level of Union, a slight seepage of water is reported. The formation is clay and porphyry. In Mexican the only work reported is on the 1000-foot level to the east. This crosscut is in nearly 800 feet. There is no change in the workings or in the formation of the ground encountered in Ophir on either the 1000-foot or Central tunnel levels. The west crosscut on the former level is in about 925 feet, and in the latter level the west crosscut is in about 450 feet. The formation is favorable. In Andes they are going in a northeasterly direction on the 175-foot level. They are in about 40 feet. In Con. Virginia no change is reported on any of the levels. They appear to be actively engaged in prospecting on and around the 1550-foot, 1650-foot and 1750-foot levels. They seem also to be laying the foundation for more important work later on. Best & Belcher and Gould & Curry are still running jointly the east crosscut on the 800-foot Bonner shaft level. From Savage nothing new comes to hand. In Chollar they are still putting in timber in the main incline at the 1100-foot level. The west crosscut from the upraise from the 100-foot level is in about 55 feet. At last advices they were in ore giving from $8 to $10 a ton. Potosi's official letter reports they are still repairing the old Crœsus shaft and, jointly with Bullion, driving the south drift ahead. It is in about 520 feet. In Alpha they are running a west crosscut from the upraise above the 500-foot level. This will strike the ore found to the west on the 500-foot level and also give good circulation when connections are made to the west. Nothing new is reported from the joint west crossdrift of Con. Imperial, Confidence and Challenge. They ought to be in the vicinity of the west lode. From Yellow Jacket nothing is allowed to leak out. It is reported in Virginia City that important work is being done, but down here they say it is to be done. In Belcher they are driving ahead on the 1200-foot level a north drift and an east crossdrift. They are extracting about six tons of fair ore a day. The Mexican mill is running on a 250-ton test of low grade gold ore and the Nevada mill on a 300-ton test. When this is done it will mean a good test of the two methods of concentration. Nothing new from Seg. Belcher or Overman. From the latter they raise about one ton of fair grade ore a day from the 900-foot level. From Caledonia more favorable news is looked for before long. In Justice the west crossdrift turned the last week in a southeasterly direction and struck an 18-inch vein of ore going $107 to the ton, of which $35 was gold. They have milled 50 tons of ore, with battery assays of $7.70 gold and $14.89 silver.

On the Brunswick lode work seems to be energetically pushed by Occidental, Potosi, Savage and jointly by Best & Belcher, Con. Virginia and Gould & Curry. It looks as if the Occidental management is satisfied with the prospects and is opening up quite an area of ore for extracting. On one of the levels they are in a good-sized body of $8 to $10 gold ore, the same as they have in Crown Point. At other points they are developing ore that assays higher. They are going west on the 550-foot level, south on the 750-foot level, and sinking on fair-grade ore from the 750-foot level. They are running on this level a north drift from the west crossdrift in high-grade ore. In Potosi they have started, or will start soon, to prospect the 35-foot body of quartz struck by the joint west crossdrift about 200 feet back. This quartz looked healthy and lively, and they look for an improvement in the new work. Chollar's official letter reports joint sinking of shaft No. 1. It is down on an incline 1100 feet. In Chollar they are prospecting and repairing on the different levels. In Savage they are drifting north on the 600-foot level. The joint work of Con. Virginia, Best & Belcher and Gould & Curry is confined to the 600-foot level, where they are crossdrifting west and also drifting south. The joint shaft is down an incline about 930 feet.

The following illustrates the changes of the week:

TEN WEEKS FOR TEN CENTS!

Strange as it may seem, that big family paper, the *Illustrated Weekly Sentinel*, of Denver, Colorado, (founded 1890) will be sent ten weeks on trial for 10c.; clubs of six, 50c.; 12 for $1. Special offer solely to introduce the paper. Gold rings set with Rocky mountain gems are given free as premiums. Latest mining news and illustrations of grand scenery each week, also true stories of love and adventure. Address as above and mention PRESS. Write today; postage stamps taken.

WANTED.—Position to take charge of a quartz mine. Am a practical miner, and have had charge of a number of properties in different States for the last 20 years. Can furnish the best of reference. Address J. D., Mining and Scientific Press.

WANTED.

A GOLD TAILINGS DUMP that can be worked by the cyanide process. Address, with particulars, Box H, Mercur, Utah.

Mines or prospects operated on contract to purchase, or under lease on fixed royalty or percentage.

Money loaned mines.

Mining companies organized, their property experted, financed and managed.

Mines, prospects, mineral lands, mining securities, contracts, bonds, stocks, leases and options bought and sold or negotiated

Examine mines, prospects and mineral lands as to their value, method of working and condition of their titles. Assay and chemical work done.

EDW. N. BREITUNG,
Marquette, Mich., U. S. A.

Cable Address: EDBEE.
Codes:
LIEBER'S.
BEDFORD McNEILL'S.

Marsh Pumps at the Mining Fair.

Among the exhibits at the Mining Fair, the Simmonds Saw Co. of this city makes a fine display of Marsh pumps that has attracted much attention from practical mining men and others interested in this class of machinery.

The Marsh compound pump with eighty pounds of steam will raise 30,000 gallons of water 200 feet high per hour. It is a marvel of simplicity and strength.

They also have stationary pumps for mines that are well suited for the work required of them. The boilers which supply steam for the Pavilion are fed by a Marsh boiler feeder, which does its work quietly, also effectively.

As the result of nearly a year's extensive travel and investigation by Mr. Marsh among the mines of the Pacific coast—with a view to learning all the requirements of pumping water from deep mines effectively and at least expense—they show a sinking pump simple in construction, durable and reliable in all respects. It is double-acting and has all the good points of other pumps, besides being much lighter, which is a desirable feature. It has a steam cylinder 12 inches in diameter, water plunger 6 inches in diameter, and a 16-inch stroke, and will raise 150 gallons of water 275 feet high per minute. It will run at a high speed without noise or jar, and it is not necessary to throttle the exhaust, as in the case of some other pumps. It will run equally well with either air or steam.

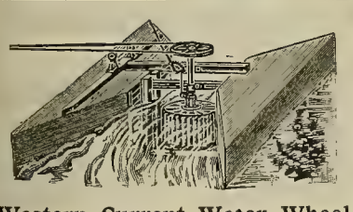
The self-governing steam valve of all of these pumps compels them to always make a full stroke, and users can depend upon them to do their work effectively at all times. *

Reasons Why Inventors Upon This Coast Are Advised To Consult With Us:

First: Because they have the opportunity to explain their inventions personally and directly to the men who write the specifications and make the drawings, so that they will get all the inventor's ideas correctly and not be liable to make mistakes.

Second: In addition to this we have resident attorneys in Washington, of long experience and high standing with the office, who attend EXCLUSIVELY to our business before the Patent Office. You have, therefore, the advantage of personal consultation in the preparation of the case, and constant attention to your application after it has been filed.

Third: Time is saved. If you send to an Eastern attorney you must depend upon your ability to write a perfect explanation to a person three thousand miles away, wait until the papers can be returned to you for signature, and then send them again to your agent to be filed, if they are fortunate enough not to need further revision and return.



Experience in preparing patent applications here and in the East has proved to us that superior work can be done here.

We have been credited with obtaining more patents in proportion to the number of applications made by us than any other firm in the business.

We have had a continuous experience in this business of over thirty years. We have the most complete Patent Library west of the Mississippi river, including full certified copies of all patents issued for the past twenty-five years. We keep these for free examination by any one who desires.

We attend to all business connected with patents, such as the preparation of Caveats, Trade-Marks, Design Patents, Assignments, Licenses and Agreements. We make examinations as to the patentability of inventions, searches and opinions as to infringements, or the scope or validity of Patents. Our Branch Offices and arrangements for Foreign Patents, Trade-Marks, etc., are very extensive and complete.

Assessment Notices.

THE ORLEANS MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Grass Valley Mining District, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 1st day of February, 1898 an assessment (No. 7, new series) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, No. 575 Mission street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 8th day of March, 1898, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 28th day of March, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

GEO. O. THURSTON, Secretary

Office—No. 575 Mission street, San Francisco, California.

MARGUERITE GOLD MINING AND MILLING Company.—Location of principal place of business, San Francisco, California; location of works, Auburn, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 19th day of February, 1898, an assessment (No. 9) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 237 12th street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 6th day of April, 1898, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 2nd day of May, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

F. METTMANN, Secretary.

Office 237 12th street, San Francisco, California. Office hours from 5 to 6 o'clock P. M. The Secretary will also receive payments from 1 to 4 P. M. at his business office, 225 Sansome street.

NORTH BLOOMFIELD GRAVEL MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, North Bloomfield, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Directors held on the 25th day of February, 1898, an assessment (No. 50) of 25 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 24, 320 Sansome street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 6th day of April, 1898, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on WEDNESDAY, the 27th day of April, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

H. PICHOIR, Secretary.

Office—Room 24, 320 Sansome street, San Francisco, California.

THORPE MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Fourth Crossing, Calaveras County, California.

Notice is hereby given, that at a meeting of the Board of Trustees, held on the 19th day of January, 1898, an assessment (No. 9) of 2½ cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 44, Phelan building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 26th day of February, 1898, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 21st day of March, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

A. F. FREY, Secretary.

Office—Room 44, Phelan building, San Francisco, California.

POSTPONEMENT.

By order of the Board of Directors, the day of delinquence in the above assessment notice has been postponed to March 12th, 1898, and the day of sale to MONDAY, April 4th, 1898.

A. F. FREY, Secretary.

Office—Room 44, Phelan building, San Francisco, California.

KATE HAYES MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, North San Juan, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 25th day of February, 1898, an assessment (No. 6) of one dollar ($1) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 24, 320 Sansome street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 5th day of April, 1898, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 26th day of April, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

H. PICHOIR, Secretary.

Office—Room 24, 320 Sansome street, San Francisco, California.

Weber
GASOLINE HOISTING ENGINE.

MONEY SAVERS.

Costs to run One Cent per Horse Power per Hour. No Coal or Wood and very little water required.

This cut represents our 10, 15, 20, 30, 40, 50 H. P. Geared Hoist.

Pumping Water 68 Feet at 3-4 Cents Per 1000 Gallons — More Than Satisfactory.

OFFICE OF GEORGE M. COOLEY,
SAN BERNARDINO, CAL., July 11, 1896.

WEBER GAS & GASOLINE ENGINE CO.,
KANSAS CITY, MO.

GENTLEMEN—I wish to make the following statement regarding the use of distillate in the "Weber" Engine. I connected up my No. 4 "Weber" for distillate, as per your instructions, and find it to be more than satisfactory. In making the test I pumped 108,000 gallons of water at a cost of three-quarters of a cent per 1000 gallons, raising the water sixty-eight feet. This, I think, is a good showing, and one that will make many friends for the "Weber." Yours very truly, GEORGE M. COOLEY.

ROPP STRAIGHT LINE FURNACE

FOR ROASTING AND DESULPHURIZING ORES.

B RIVERSIDE C) Cal State Library 1 '97

Extracts from Letters R[illegible] Philip Argall, Manager the Metallic Extraction [illegible]anide, Colorado:

January 2, 1897.

"The roasting is invariably good. We can do 80 tons per day to 0.13% sulphur, when everything runs smooth. Our month record which, of course, includes all delays, is 1700 tons, from 1.94% sulphur to 0.16%."

February 19, 1897.

"Our furnace is now running very nicely indeed, averaging 90 tons per day to 0.10% sulphur, and doing excellent work; in fact, it has improved right along and we are highly pleased with it.

"For 24 hours ending 7 A. M. to-day 102 tons were roasted."

The **ROPP FURNACE** is now in successful operation at the following reduction works: The Hanauer Smelting Works, Salt Lake City, Utah (one furnace); The Metallic Extraction Co., Cyanide, Colo. (one furnace); The Colorado-Philadelphia Reduction Co., Colorado City, Colo. (three furnaces); The Selby Smelting & Lead Co., Selby, Cal. (two furnaces); The Mount Morgan Gold Mining Co., Rockhampton, Queensland (one furnace); Broken Hill Proprietary Co., Broken Hill, New South Wales (four furnaces); Puget Sound Reduction Co., Everett, Washington; Colorado Ore Sampling & Reduction Co., Cripple Creek, Colo.; Consolidated Kansas City Smelting & Refining Co., for the Arkansas Valley Smelting Works, Leadville, Colo.; Robert Lanyon's Son's Spelter Co., Iola, Kansas (two furnaces); Mountain Copper Co., Ltd., Keswick, Cal.

No. 1966.—VOLUME LXXVI. Number 11. SAN FRANCISCO, SATURDAY, MARCH 12, 1898. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

Mines Around Telluride, Colorado.

On this and pages 294 and 295 appear illustrations of mining scenes of Telluride, high in the mountains of southwestern Colorado, which tell their own story. This vicinity is the seat and center of large tunnel enterprises. It is also noted as the site of the Smuggler-Union property, a view of the mill appearing on page 295. It is locally claimed that the Smuggler-Union mines contain the most extended ore body yet opened up in the world, being the most remarkable vein for continuity and regularity in the history of mining, producing a regular and valuable output. There are over twenty-five miles of underground workings in the property in the nature of crosscuts, tunnels, drifts, levels, upraises, shafts and winzes. The formation in which this vein occurs is trachyte, or volcanic breccia, found where Marshall creek cuts through the different geological strata, at an elevation of 9800 feet. At the summit, between Canyon and Marshall creeks, the elevation is 13,200 feet, and there the trachyte has a depth of 3400 feet. Below this formation no development work has been done, and the character of the vein after passing into the underlying conglomerate and sandstone is unknown.

The Smuggler-Union Co. has developed this mine at varying depths, in places almost 2000 feet, for a linear distance of nearly 8000 feet, and these workings have disclosed an ore body everywhere present in sufficient quantity and value to warrant continuous stopings. The existence of a continuous ore body carrying profitable values for a length of more than one and one-half miles is most unusual. The vein averages 5 feet in thickness, is seldom less than 2 feet, rarely widening out to 10 feet. The minerals are pyrite, chalcopyrite, galenite, sphalerite and arsenical silver. Native silver is rarely encountered, but metallic gold is more frequent. A remarkable feature is the constant increase in gold values toward the south from the summit of the divide, and a corresponding decrease in silver values in the same direction. On crossing the divide at the extreme north end of the property the gold value in the vein is hardly one-quarter that of the silver, but the transition from silver to gold is almost constant until a mile south the vein practically becomes a gold lode.

CALIFORNIA STATE LIBRARY

MINE BUILDINGS, NELLIE MINE, TELLURIDE, COLO.

Looking down Bear creek. In the distance are high mountains, the "Sawtooth range."

The distance between the fifth and seventh levels, the latter having been driven since it was found advantageous to adopt long chutes, is 260 feet; and it is between these two levels that there is at present one of the largest ore bodies blocked out ever seen—250 feet in depth by 4500 feet in length. It will require several years at the present rate of consumption—200 tons daily—to exhaust this area. The method of mining the ore in this property does not differ from that employed in most of the gold-silver mines of the district. The levels are timbered with stulls, upon which lagging to support the waste produced in stoping is placed. The country rock on the hanging wall is then stripped to a height of 7 feet, and the vein is shot down in mass to be broken up and passed into chutes, as noted in the Telluride *Journal*, to which enterprising publication we are indebted for the illustrations.

Noticeable are the natural advantages for mining by tunnels, basins and gulches in every direction, which enable depths of 300 and 400 to 2000 feet to be obtained on many leads by comparatively short tunnels, which not only open up the vein, but provide an outlet for the ore and drainage for the property. In the Smuggler-Union a vein is cut at a depth of more than 2000 feet below the surface, with not a single pump for hoisting water in the mines, they being practically dry.

The company's mill, illustrated on page 295, is at Pandora, one mile above Telluride, and is connected with the mine workings, the mouth of Bullion tunnel, by a tramway one mile long, capacity 200 tons in ten hours. The mill has fifty stamps of 800 pounds weight that drop 9 inches, ninety-five drops per minute.

During '97 68,000 tons of milling and shipping ore went down. While this ore was coming down there was sent up: lumber, 216,720 feet; lagging, 15,238 pieces; stulls, 3063. The latter timbers are from 12 to 18 feet long and from 14 to 30 inches in diameter. There were also sent over this aerial tramway of mill timbers, 26,500; coal, 4,250,150 pounds; merchandise, 21,276,155 pounds. The ore tonnage mentioned, if packed down, would alone have cost $250,000. The saving effected is apparent.

The ore has been concentrated on the basis of eight tons into one. The concentrate product for the past year has averaged twenty tons daily.

IT is of interest to note that during the Golden Jubilee celebration, viz: from Jan. 24 to March 5, '98, 342 subscriptions were added to the MINING AND SCIENTIFIC PRESS lists. Such constantly recurring facts are among the reasons why those who want wide announcement advertise in this paper. They know that nowhere else can they get such publicity. It is not the comparative cost but the result of advertising that determines its value to the advertiser.

VIRGINIA CITY, NEVADA, is the one mining camp where one commodity—labor—still commands the same price it did a generation ago. Everything else—machinery, supplies, provisions, clothing, mining accessories of all kinds—are to-day procurable there at a reduction of from 40 to 50 per cent, but, as in the old bonanza days, the old Nevada scale of wages still obtains. One of the principal reasons for this is that the companies paying that scale are not dependent on private ownership, the purchasers of stock ordinarily caring little for any detail of mine work.

A CALIFORNIA CONGRESSMAN this week introduced a bill directing the President to appoint a commission of three residents of California to examine all lands patented by railroad companies in this State since January 1, 1893, where such lands appear to have been worked as mineral lands prior to the date of the patent, or where valuable deposits are supposed to exist. The bill provides that where the commission finds land contains minerals it shall report the fact in writing to the Secretary of the Interior, and if it appears to him that the lands should not have been patented to the railroad company, because of the mineral character, it shall be the duty of the Secretary of the Interior to call the attention of the Attorney-General thereto, and if the title of said lands has not been transferred by the railroad company to innocent purchasers for valuable consideration, it shall be the duty of the Attorney-General to commence suit to set aside and vacate such patents. The sum of $10,000 is appropriated for making the examination.

MANY MISTAKES are made in the purchase of mining machinery, the chief cause lying in the fact that the purchasing parties are too eager to get the machinery on the ground before they have demonstrated what they can count on for an output, or by the purchase of machinery which is not required on the property and will not do the work required of it. As a rule, the fault lies with the purchaser. The first thing to know is what the mine contains. Tests of the ore should be carefully made at various stages of the property's development, all of which should be carefully noted and recorded. Not only should the value of the ore and all its contents be ascertained, but in every instance the owner should know in what form the mineral occurs. After this has been done, and a sufficient amount of ore is taken out and exposed to justify the purchase of machinery, unless the owner is well informed himself or has a practical man of experience with him, he could do no better than to go to a responsible mining machinery manufacturer and lay all the facts before him, when, in the majority of cases, he would get the proper machinery and be able to successfully work his mine. Milling, concentrating, smelting and refining are each adjuncts of mining, and yet few ordinary mine owners are sufficiently acquainted with these adjuncts any more than a millman who has spent many years in that business is a first-class mining operator. But the manufacturer of mining machinery has a varied experience in his business. He is called upon to put machinery into all kinds of mines, and the safest way to do, unless one is oneself a practical millman, is to enlist his attention and avail oneself of his experience. In that manner one may often turn a worthless enterprise into a profitable investment. But the first rule is to know that one needs machinery and that the property will justify or demand its erection.

An Enterprise of Unusual Magnitude.

The Western Australian government has in contemplation a very large hydraulic enterprise, which is of interest to California and San Francisco. It is so important a project, involving the expenditure of so much money, that it occasions considerable preliminary discussion. The fact that California has developed and brought to a high degree of perfection the transmission of water, makes the subject one of local interest, Indeed, it is not impossible that proper representation and industrious effort would bring this entire contract to California.

As is well known to all readers of this paper, the Coolgardie gold region in Western Australia is one of considerable richness and extent. Lack of water retards its development. The rainfall is less than 5 inches, and water of inferior quality is sold at from 5 to 10 cents per gallon where produced. Recently the Premier of the Western Australia Assembly testified that on one occasion it cost him $5 to water five horses. Men operating mines have been obliged to carry salt water several miles for use in crushing rock. The Western Australian government proposes to supply this section of gold-mining country with 5,000,000 gallons of water per day. The plant involves the building of a pipe line 328 miles long from the Darling hills near the coast, where there is a good rainfall and where sites for reservoirs can easily be found. The intended source of supply is the Helena river, 320 feet above the sea, where a concrete dam 100 feet in height and 650 feet upper surface length would be built with a rock foundation. There is a watershed drainage with an area of about 550 square miles; and the engineers figure that less than 4 per cent of the rainfall in that area, if impounded, would furnish the desired supply.

The proposed service reservoir at Coolgardie, 328 miles inland, would be 1650 feet above sea level, or 1330 feet above the supply reservoir on the coast. The proposition is to connect these two reservoirs by 328 miles of 30-inch steel pipe. On this line would be nine pumping stations. It is contemplated that the pumping engines and necessary buildings would cost $1,000,000; that there would be 90,000 tons of 30-inch pipe, which would cost $3,350,000; transportation of that pipe from Freemantle, $700,000; laying and joining the pipe, $1,100,000; reservoirs, $1,500,000; one hundred miles of 12-inch distributing pipe, $850,000. It is estimated that the annual operating expenses would be about $1,600,000; and that on this basis the water at Coolgardie would cost 84 cents per thousand gallons, delivered.

The Legislature of Western Australia approves the project, and has authorized the issuing of bonds to the amount stated. A committee of experts in England was appointed to study the pumping machinery. This committee, composed of Messrs. Caruthers, Deacon and Unwin, reported that 5,000,000 daily, or 9.28 cubic feet per second, could be raised 1330 feet and carried 328 miles in a main 26 to 30 inches in diameter. They figured the total frictional resistance at 1222 feet, making a total head of about 2600 feet. For the 26-inch pipe the velocity in the main would be 2.513 feet per second; for the 28-inch pipe, 2.172 feet; for the 30-inch pipe, 1.888 feet. That for lap-welded pipe the frictional resistance would be respectively 5.103, 3.538 and 2.497; and that for riveted pipe the frictional resistance would be respectively 6.159, 4.270 and 3.103 feet; that it would require 2881 pump H. P.

Up to this point the engineers composing the committee appeared to be uniform in belief, and to have reached conclusions that are to be universally accepted. The material to be used in the piping, the manner of construction and accompanying details, are by no means matters of unanimity on the part of the committee; and as upon these very points depends the fate of the entire project, the question is one of interest to engineers of hydraulic construction everywhere.

The idea in general is to have the line of pipe follow the line of the Gold Fields railway, and it has been locally believed that the pipe could throughout its entire length be laid above the surface. The committee excluded the cost of iron pipe and paid some attention to steel spiral pipe imbedded in cement, which has had some favorable experience in Algeria. The committee recommends using mild steel with a tenacity of twenty-seven tons per square inch, and a minimum elongation of 16 per cent in 8 inches.

So many things in connection with this will naturally occur to the minds of those best fitted to pass expert judgment, that it is not to be wondered at that the committee hesitates to more than discuss or tentatively recommend. It is at this point that California hydraulic engineers and builders of the style of pipe evidently required, could, it is believed, be of benefit to the project and themselves.

The matter will be given considerable notice in technical journals on both sides of the Atlantic. In the *Engineering News* of the 17th ult. appears an editorial which intelligently discusses the proposition from the Atlantic standpoint. In that editorial it is said:

* * * * * * * * * *

The most important question which these engineers were asked to consider is the design of the pipe line, and their opinions make exceedingly interesting reading, to American engineers at least.

Cast iron pipe was excluded from consideration at the outset, as its cost would be so great as to make the scheme financially impracticable. In considering the best kind of pipe to adopt for the line, certain controlling conditions should be borne in mind. One is that the country across which the pipe line will extend is an arid region, and the soil is impregnated with salt, according to the engineers' report. Whether by this is meant sodium chloride or the ordinary alkaline salts usually present in the soil of arid regions, we do not know; but the latter is the more probable. In either case, however, any metal pipe is sure to be rapidly corroded unless it is protected at every point from contact with the soil. A second point to be considered is that the great length of the pipe line makes tightness an important matter. Slight leakage or evaporation from the surface of a porous pipe which would be too trivial for consideration upon a pipe line of ordinary length might amount to the loss of a considerable percentage of the total flow in a pipe line 328 miles long.

Turning now to the report of the Commission, we find, first, an investigation of a pipe made up of a steel spiral embedded in concrete. They seem to have spent considerable time investigating this pipe, but arrive at the conclusion that at present they cannot recommend it. From this distance one is unable to see why such a conduit should be seriously considered at all for such a place. It will be evident that the steel spiral must be the sole reliance for strength to sustain the pipe against internal bursting pressure, hence no considerable economy in the amount of steel will be possible compared with a line made up of steel plates. A more serious objection, however, is the very small longitudinal strength of the pipe. With the great temperature changes of the Australian climate, expansion and contraction would seem quite likely to cause cracks in the concrete, the repair of which would be difficult, to say the least.

Next the Commission takes up another patent pipe, which is an ingenious device for avoiding a longitudinal weld or riveted joint in a pipe made of steel plates. The edges of the plate to be joined are inserted in grooves in a specially rolled bar, and the joint is then rolled under pressure in such a manner that the bar is flattened, and a tight joint is, supposedly, made. There are two or three inventions of this class now being exploited in England. They may, perhaps, have merit for certain situations; but the only advantage it could offer over ordinary riveted pipe would be a possible small saving in cost. To employ any such untried invention on a work of such magnitude would be absurd. The Commission, in fact, confesses that until such pipes have been manufactured commercially and tested on a large scale they are unable to recommend their use, though they strongly intimate that they would like to do so.

After shelving, temporarily at least, these two inventions, the Commission very properly dismisses spiral riveted pipe, and then takes up the discussion of the use of welded or riveted pipes. In order that we may present the Commission's opinion fairly, we quote this portion in full:

Pipes with gas-welded longitudinal joints are undoubtedly the best. They are stronger for a given thickness than riveted pipes, and having a smooth surface, they present less interruption to the free flow of the water. But the immunity from possible leakage at joints is a still more important advantage. Per unit of length they are somewhat more expensive than riveted pipes, but being about 30 per cent stronger for equal diameter and thickness, it is actually cheaper to employ them wherever the necessary thickness of the riveted pipe is at least ¼ inch, below which thickness welded pipes become difficult to manufacture of the required diameters.

We therefore recommend that those pipes which will be subjected to the heavier pressures, and which therefore require a thickness of ¼ inch or more, should have two gas-welded longitudinal joints, and that they be made in tubes of about 14 feet length, coupled into pipes of about 28 feet, by inserting a plain end of one tube into a socket formed on the other tube, the transverse joint being riveted. Welded tubes can be manufactured of somewhat greater length, and it would be desirable that they should be as long as possible, because it would reduce the number of joints and possible points of leakage. We understand, however, that lengths greater than 28 feet would be inconvenient for carriage on the Western Australian railways.

The riveted pipes should be made with only one longitudinal joint, each "ring" or "tube" being therefore formed of a single plate. The greater part of the aqueduct will consist of such pipes, 28 inches to 30 inches diameter and 3-16 inch thick, and the greatest lengths of the tubes of which such pipes are made up will be about 5 feet 6 inches. The longitudinal joints should be double-riveted lap joints, and those of contiguous lengths should not fall in one line. Each tube should be made of the maximum length that can be obtained from a single plate These tubes should be single riveted together into lengths convenient for transport. The question of the connection of these lengths will be dealt with in our final report. The tubes may be made of uniform diameter, butt-jointed, with single-riveted covering rings. This, however, involves two rows of rivets at each transverse joint, two circular joints to be calked which can be calked only at the outer edges, and special difficulty of calking and rendering water-tight where the ring covers the overlap of the longitudinal joints. As there are two other ways of making the transverse joints, either of which is less liable to these objections, we do not recommend butt joints. One of these ways is to expand one end of each tube, thus forming a socket to receive the plain end of the next tube, and to join the two by single riveting. The other plan is to construct the tubes alternately of larger and smaller diameter, the diameters differing by twice the plate thickness. Each larger tube will then overlap the smaller tubes at either end, and will be connected therewith by single riveting. Having regard to all the circumstances, we recommend that the riveted pipes should be constructed of tubes of alternately larger and smaller diameter. In coming to this conclusion we have, of course, considered the increased hydraulic resistance, which we are satisfied is unimportant.

The grounds upon which the above recommendations are based are by no means clear in every case, and some of them are still a puzzle to us. For example, pipe made up with "two gas-welded longitudinal joints" is not a well known product on this side of the Atlantic. We can only conjecture that the Commission desires a thinner pipe than can be made in so large sizes by the ordinary lap-welding process, and they have in mind some English process by which a welded joint is made by heating the edges of the plate to be joined. This process, the Commission says, however, is not applicable to pipes of such large diameter made of plates less than ¼-inch thickness. Hence for the principal part of the conduit they recommend a riveted pipe of 3-16-inch plates.

One is next puzzled to know why they limit the distance between circumferential joints to 5 feet 6 inches. At first sight the simplest and cheapest way to make such a pipe would seem to be to take an 8-foot wide plate, bend it into a tube, and rivet up the longitudinal joint. But there are two difficulties to be met. The first is that rolling such thin plates in such widths is quite difficult, and when attempted the spring of the rolls is apt to make the plate considerably thicker in the middle than on the edges. The second is that the size of the fixed stake of the riveting machine limits the length in which riveted pipes of such small diameter can be made. We presume the Commission have based their recommendations on what English rolling mills and riveting machinery can do. Possibly American manufacturers can do better; if so, they should not fail to make their ability to do so known.

It should be said, however, that the saving in frictional resistance by cutting down the number of circumferential seams will not be so great as might at first sight be supposed. It will be seen by those who carefully study the Commission's recommendations that they have adopted an exceedingly large size of pipe for the volume of water they propose to deliver. The velocity of the water flowing in the pipe will be only about 1 3-5 feet per second, and this reduces the friction head so much that the difference between riveted pipe and smooth pipe is no great amount. We assume that the Commission determined by careful compilations that the extra cost of the larger pipe was warranted by the saving in pumping expenses due to the decreased hydraulic resistance.

The Commission describes with much detail the method of treating the pipe to protect it from corrosion, a very proper precaution, considering the thinness of the pipe and the alkali deserts through which it is laid. We believe, however, that they might learn some valuable lessons by studying American experience in this field, which has been far more extended than experience in all the rest of the world combined, if we mistake not.

Notwithstanding the elaborate precautions which are proposed against corrosion, the Commission recommends that the pipe should be laid upon the surface of the ground, and this is, perhaps, the most surprising statement in the whole report. We know of no instance where a continuous riveted pipe of considerable length is exposed to any such extremes of temperature as would exist in the case of the Coolgardie line. We are informed that computations show a strain in metal between the rivet holes in circumferential seams of riveted pipes equal to about 16,000 pounds per square inch from a change in temperature of 50°. That a much greater variation in temperature than this would occur in a pipe exposed to the sun on the arid plains of West Australia is beyond question, and that such strains must invariably cause loosening and leakage at the riveted joints seems almost equally sure. The water cannot be relied upon to equalize the temperature, for the very great distance between pumping stations will cause the water to be heated or cooled to the temperature of the pipe itself, whatever that may be, in the course of its journey, provided the latter is exposed on the surface of the ground as is proposed.

Space forbids us to criticise further the recommendations of this report in detail; but enough has been said, we believe, to make clear the fact that it would be much to the advantage of the Colony to either employ American engineers to advise it regarding its great enterprise, or else insist that its English advisers shall thoroughly study American practice in the construction of long pipe lines.

Nothing is said whatever in the report concerning the use of wood stave pipe; very likely the eminent English engineers had never heard of its use in this country. We cannot pretend to say, of course, that such pipe would be the best for the Coolgardie line; but its extended and successful use here under conditions in many respects quite similar to those which exist in Australia makes it entirely certain that no investigation can claim to be complete that does not examine into the merits of this class of pipe.

As to its durability, it seems safe to say that it would be at least as durable as a 3-16-inch steel pipe laid on salt or alkali soil. Wood stave pipes which have been in use for nearly thirty years in this country are still in good condition. The smooth interior surface of wood pipe results in less hydraulic friction than in any kind of iron pipe. Wood stave pipe could be built either of the native Australian woods or from the redwood of the Pacific coast, which could be delivered at Australian ports at a much smaller freight cost than

would be charged on iron pipe. It could be built with native labor, and the cost of contractors' plant would be trifling compared with the cost of a plant for riveting-up steel pipe, dipping it, and relaying it.

It would probably be inadvisable to use wood pipe for the parts of the line subjected to heaviest pressure; the American practice, as our readers well know, is to use steel pipe where the head is over 100 feet or so. The Coolgardie pipe line, as planned, however, consists of a series of steep lifts at each pumping station, followed by a long down grade to the next pumping station, and an examination of the profile in our last issue will show that three-fourths or more of the line is under no pressure which would interfere with the use of wood pipe. The saving in cost which would result from the substitution of wood stave pipe for three-quarters of the line we shall not attempt to estimate; but we believe it is well worth looking into.

* * * * * * * * *

Our latest information is that the West Australian government has not yet been able to float the large bond issue, which it offered to raise funds for this work, at the rate of interest which the Colony was willing to pay; and matters are consequently at a standstill. Under these circumstances, the Colonial officers, if they desire to carry out their great enterprise, would do well to turn toward this country for aid. It is by no means impossible that they can obtain plans and advice here which will enable them to carry out their scheme at a saving of millions of dollars compared with the p ans proposed by the English engineers, and at the same time to utilize in the work to a large extent their own home labor and materials.

Regarding the above, it is evident that the country across which the pipe line will extend is somewhat similar to portions of southwestern California and southeastern Nevada, and that the "salt" mentioned in the engineers' report is intended to apply to the alkali character of the soil. The criticism and conclusions of our contemporary are in the main to be agreed with and confirmed. It is mistaken in assuming that any Australian native wood could be used. There is no Australian timber that would be found equal to the requirements of such a line. The only wood that could be successfully used is the California redwood. So far as our observation goes in regard to the report of the commission of English engineers, there is much that will be inexplicable to engineers on this coast, especially in respect to plate or riveted pipes. The proposition laid down, and especially the remarks upon constructive features, are open to an inference that the members of the Commission have had no experience in this branch of work, one that is familiar to the Pacific coast.

The Coolgardie line consists of abrupt elevation of the water, in stages, along the line and then a flow through long reaches at a velocity of less than 1.5 feet per second with but little pressure. This points to a wide divergence in conditions not fully recognized in the present report and permitting, if not demanding, at least two kinds of pipe. A metallic pipe whose weight was based on the hydraulic requirements would soon be destroyed by the corrosive action of the alkaline earth; a pipe of California redwood will come nearest meeting the requirements and be cheapest to construct and place. This wood is insured a life of twenty years at least. It is the belief of such men as Mr. Jno. Richards of this city that the fact that as experience in such work as that at Coolgardie has been confined mainly to this coast, our local engineers and contractors could undoubtedly carry out the work in a better and cheaper manner than can be done by European contractors.

That the enterprise will be pushed is evident, and it is believed that the material required, and the skill, experience and financial resources necessary to bring the work to a successful completion could be supplied in this city. The entire matter is worthy of local attention.

In the new *Examiner* building, Third and Market streets, San Francisco, is exhibited a new departure in architectural construction in this city in the use of terra cotta. Those potsherds outlast Time itself. Burned clay is the most indestructible material known to man. Fire cannot harm it nor water cause it to decay; nor frost nor sun nor the passing seasons of endless ages so much as soil its immutable surface. The oldest monuments of human handiwork in existence are prehistoric bits of baked clay and remnants of pottery, and the most ancient of human records are the tile tablets found in the buried cities of the Orient. These imperishable memorials are virtually terra cotta. This substance, formed into architectural ornaments, is found in the ruins of forgotten capitals bearing the stamp of the artist, the artisan, and the scribe who perished uncounted centuries ago. Terra cotta is known to the architects as well as to the archæologists as the most durable of materials known by man, and yet in the current world of the modern builder it has until the last few years, and especially in this country, been used only to a limited extent. In our constructive work it is still regarded somewhat in an experimental light—an experiment having the sanction of the ancients, it is true, but yet with us and for our untried purposes involving possible results not set down in the school manuals.

Out of ten people met on the streets of San Francisco probably seven have in their pockets letters from Klondikers. Every newspaper published in any part of the nation has a letter from some late resident who has at least got as far as Dyea or Skaguay. Never in the history of mankind was a hegira so thoroughly written up, and 99 of every 100 who write tell the truth. All who start realize that of a thousand men but one has any possibility of success; but each one confidently hopes that he will be the lucky one. It is pitiful to contemplate the certainty of unavailing peril and misery that will be the inevitable lot of the adventurers now flocking into that dreary region.

There is a nobility about the occupation of a miner which attaches to few if any other callings. In other business a dollar made is a dollar won or snatched from the pocket of a fellow competitor in the same line of business; but a dollar made by the miner makes the whole world that much richer, as it is taken from no man's pocket, but comes in its native state from mother earth. It is a dollar which has no associations of crime, want or misery to be ashamed of, and, unlike other productions, is not consumed or destroyed, but is a permanent contribution to the wealth of the community.

United States Mining Laws, and Regulations Thereunder, Relative to the Reservation, Exploration, Location, Possession, Purchase and Patenting of the Mineral Lands in the Public Domain.

NUMBER IV.

78. There should likewise be filed a certificate, under seal of the court having jurisdiction of mining cases within the judicial district embracing the claim, that no suit or action of any character whatever involving the right of possession to any portion of the claim applied for is pending, and that there has been no litigation before said court affecting the title to said claim, or any part thereof, for a period equal to the time fixed by the statute of limitations for mining claims in the State or Territory as aforesaid, other than that which has been finally decided in favor of the claimant.

79. The claimant should support his narrative of facts relative to his possession, occupancy, and improvements by corroborative testimony of any disinterested person or persons of credibility who may be cognizant of the facts in the case and are capable of testifying understandingly in the premises.

ADVERSE CLAIMS.

Sec. 2326, R. S. Where an adverse claim is filed during the period of publication, it shall be upon oath of the person or persons making the same, and shall show the nature, boundaries, and extent of such adverse claim, and all proceedings, except the publication of notice and making and filing of the affidavit thereof, shall be stayed until the controversy shall have been settled or decided by a court of competent jurisdiction, or the adverse claim waived. It shall be the duty of the adverse claimant, within thirty days after filing his claim, to commence proceedings in a court of competent jurisdiction, to determine the question of the right of possession, and prosecute the same with reasonable diligence to final judgment; and a failure so to do shall be a waiver of his adverse claim. After such judgment shall have been rendered, the party entitled to the possession of the claim, or any portion thereof, may, without giving further notice, file a certified copy of the judgment roll with the register of the land office, together with the certificate of the surveyor-general that the requisite amount of labor has been expended or improvements made thereon, and the description required in other cases, and shall pay to the receiver five dollars per acre for his claim, together with the proper fees, whereupon the whole proceedings and the judgment roll shall be certified by the register to the Commissioner of the General Land Office, and a patent shall issue thereon for the claim, or such portion thereof as the applicant shall appear, from the decision of the court, to rightly possess. If it appears from the decision of the court that several parties are entitled to separate and different portions of the claim, each party may pay for his portion of the claim with the proper fees, and file the certificate and description by the surveyor-general, whereupon the register shall certify the proceedings and judgment roll to the Commissioner of the General Land Office, as in the preceding case, and patents shall issue to the several parties according to their respective rights. Nothing herein contained shall be construed to prevent the alienation of a title conveyed by a patent for a mining claim to any person whatever.

Be it enacted in the Senate and House of Representatives of the United States of America in Congress assembled, That if, in any action brought pursuant to section twenty-three hundred and twenty-six of the Revised Statutes, title to the ground in controversy shall not be established by either party, the jury shall so find, and judgment shall be entered according to the verdict. In such case costs shall not be allowed to either party, and the claimant shall not proceed in the land office or be entitled to a patent for the ground in controversy until he shall have perfected his title.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That the adverse claim required by section twenty-three hundred and twenty-six of the Revised Statutes may be verified by the oath of any duly authorized agent or attorney in fact of the adverse claimant cognizant of the facts stated; and the adverse claimant, if residing at the time being beyond the limits of the district wherein the claim is situated, may make oath to the adverse claim before the clerk of any court of record of the United States or the State or Territory where the adverse claimant may then be, or before any notary public of such State or Territory.

80. An adverse mining claim must be filed with the register and receiver of the land office where the application for patent was filed, or with the register and receiver of the district in which the claim is situated at the time of filing the adverse claim. It must be on the oath of the adverse claimant, or it may be verified by the oath of any duly authorized agent or attorney in fact of the adverse claimant cognizant of the facts stated.

81. Where an agent or attorney in fact verifies the adverse claim, he must distinctly swear that he is such agent or attorney, and accompany his affidavit by proof thereof.

82. The agent or attorney in fact must make the affidavit in verification of the adverse claim within the land district where the claim is situated.

83. The adverse notice must fully set forth the nature and extent of the interference or conflict; whether the adverse party claims as a purchaser for valuable consideration or as a locator; if the former, a certified copy of the original location, the original conveyance, a duly certified copy thereof, or an abstract of title from the office of the proper recorder should be furnished, or if the transaction was a merely verbal one he will narrate the circumstances attending the purchase, the date thereof, and the amount paid, which facts should be supported by the affidavit of one or more witnesses, if any were present at the time, and if he claims as a locator he must file a duly certified copy of the location from the office of the proper recorder.

84. In order that the "*boundaries*" and "*extent*" of the claim may be shown, it will be incumbent upon the adverse claimant to file a plat showing his entire claim, its relative situation or position with the one against which he claims, and the extent of the conflict. This plat must be made from an actual survey by a United States deputy surveyor, who will officially certify thereon to its correctness; and in addition there must be attached to such plat of survey a certificate or sworn statement by the surveyor as to the approximate value of the labor performed or improvements made upon the claim by the adverse party or his predecessors in interest, and the plat must indicate the position of any shafts, tunnels, or other improvements, if any such exist, upon the claim of the party opposing the application, and by which party said improvements were made: *Provided, however*, That if the application for patent describes the claim by legal subdivisions, the adverse claimant, if also claiming by legal subdivisions, may describe his adverse claim in the same manner without further survey or plat.

85. Upon the foregoing being filed within the sixty days' publication, the register, or in his absence the receiver, will give notice in writing to *both parties* to the contest that such adverse claim has been filed, informing them that the party who filed the adverse claim will be required within thirty days from the date of such filing to commence proceedings in a court of competent jurisdiction to determine the question of right of possession, and to prosecute the same with reasonable diligence to final judgment, and that, if such adverse claimant fail to do so, his adverse claim will be considered waived, and the application for patent be allowed to proceed upon its merits.

86. When an adverse claim is filed as aforesaid, the register or receiver will indorse upon the same the precise date of filing, and preserve a record of the date of notifications issued thereon; and thereafter all proceedings on the application for patent will be suspended, with the exception of the completion of the publication and posting of notices and plat, and the filing of the necessary proof thereof, until the controversy shall have been adjudicated in court, or the adverse claim waived or withdrawn.

87. Where an adverse claim has been filed and suit thereon commenced within the statutory period, and final judgment determining the right of possession rendered in favor of the applicant, it will not be sufficient for him to file with the register a certificate of the clerk of the court, setting forth the facts as to such judgment, but he must, before he is allowed to make entry, file a certified copy of the judgment, together with the other evidence required by section 2326, Revised Statutes.

88. Where such suit has been dismissed, a certificate of the clerk of the court to that effect or a certified copy of the order of dismissal will be sufficient.

89. After an adverse claim has been filed and suit commenced, a relinquishment or other evidence of abandonment will not be accepted, but the case must be terminated and proof thereof furnished as required by the last two paragraphs.

90. When an adverse claim has been filed, but no suit commenced against the applicant for patent within the statutory period, a certificate to that effect by the clerk of the State court having jurisdiction in the case, and also by the clerk of the circuit court of the United States for the district in which the claim is situated, will be required.

VERIFICATION OF AFFIDAVITS IN RELATION TO MINERAL ENTRIES.

Sec. 2335, R. S. All affidavits required to be made under this chapter may be verified before any officer authorized to administer oaths within the land district where the claims may be situated, and all testimony and proofs may be taken before any such officer, and, when duly certified by the officer taking the same, shall have the same force and effect as if taken before the register and receiver of the land office. In cases of contest as to the mineral or agricultural character of land, the testimony and proofs may be taken as herein provided on personal notice of at least ten days to the opposing party; or if such party cannot be found, then by publication at least once a week for thirty days in a newspaper, to be designated by the register of the land office as published nearest to the location of such land; and the register shall require proof that such notice has been given.

Sec. 2. That applicants for mineral patents, if residing beyond the limits of the district wherein the claim is situated, may make any oath or affidavit required for proof of citizenship before the clerk of any court of record, or before any notary public of any State or Territory.

(See Adverse Claims.)

GENERAL LEGISLATION.

Sec. 2338, R. S. As a condition of sale, in the absence of necessary legislation by Congress, the local legislature of any State or Territory may provide rules for working mines, involving easements, drainage, and other necessary means to their complete development; and those conditions shall be fully expressed in the patent.

Sec. 2339. Whenever, by priority of possession, rights to the use of water for mining, agricultural, manufacturing, or other purposes, have vested and accrued, and the same are recognized and acknowledged by the local customs, laws, and the decisions of courts, the possessors and owners of such vested rights shall be maintained and protected in the same; and the right of way for the construction of ditches and canals for the purposes herein specified is acknowledged and confirmed; but whenever any person, in the construction of any ditch or canal, injures or damages the possession of any settler on the public domain, the party committing such injury or damage shall be liable to the party injured for such injury or damage.

Sec. 2340. All patents granted, or preemption or homesteads allowed, shall be subject to any vested and accrued water rights, or rights to ditches and reservoirs used in connection with such water rights, as may have been acquired under or recognized by the preceding section.

Sec. 2341. Wherever, upon the lands heretofore designated as mineral lands, which have been excluded from survey and sale, there have been homesteads made by citizens of the United States, or persons who have declared their intention to become citizens, which homesteads have been made, improved, and used for agricultural purposes, and upon which there have been no valuable mines of gold, silver, cinnabar, or copper discovered, and which are properly agricultural lands, the settlers or owners of such home teads shall have a right of preemption thereto, and shall be entitled to purchase the same at the price of one dollar and twenty-five cents per acre, and in quantity not to exceed one hundred and sixty acres; or they may avail themselves of the provisions of chapter five of this title, relating to "Homesteads."

Sec. 2342. Upon the survey of the lands described in the preceding section, the Secretary of the Interior may designate and set apart such portions of the same as are clearly agricultural lands, which lands shall thereafter be subject to preemption and sale as other public lands, and be subject to all the laws and regulations applicable to the same.

Sec. 2343. The President is authorized to establish additional land districts, and to appoint the necessary officers under existing laws, wherever he may deem the same necessary for the public convenience in executing the provisions of this chapter.

Sec. 2344. Nothing contained in this chapter shall be construed to impair in any way, rights or interests in mining property acquired under existing laws; nor to affect the provisions of the act entitled "An act granting to A. Sutro the right of way and other privileges to aid in the construction of a draining and exploring tunnel to the Comstock lode, in the State of Nevada," approved July twenty-five, eighteen hundred and sixty-six.

Sec. 2345. The provisions of the preceding sections of this chapter shall not apply to the mineral lands situated in the States of Michigan, Wisconsin and Minnesota, which are declared free and open to exploration and purchase, according to legal subdivisions, in like manner as before the tenth of May, eighteen hundred and seventy-two. And any bona fide entries of such lands within the States named since the tenth of May, eighteen hundred and seventy-two, may be patented without reference to any of the foregoing provisions of this chapter. Such lands shall be offered for public sale in the same manner, at the same minimum price, and under the same rights of preemption as other public lands.

Sec. 2346. No act passed at the first session of the Twenty-eighth Congress, granting lands to States or corporations to aid in the construction of roads or for other purposes, or to extend the time of grants made prior to the thirtieth day of January, eighteen hundred and sixty-five, shall be construed as to embrace mineral lands, which in all cases are reserved exclusively to the United States, unless otherwise specially provided in the act or acts making the grant.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That within the States of Missouri and Kansas deposits of coal, iron, lead, or other mineral be, and they are hereby, excluded from the operation of the act entitled "An act to promote the development of the mining resources of the United States," approved May tenth, eighteen hundred and seventy-two, and all lands in said States shall be subject to disposal as agricultural lands.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That all citizens of the United States and other persons, bona fide residents of the State of Colorado, or Nevada, or either of the Territories of New Mexico, Arizona, Utah, Wyoming, Dakota, Idaho, or Montana, and all other mineral districts of the United States, shall be, and are hereby, authorized and permitted to fell and remove, for building, agricultural, mining, or other domestic purposes, any timber or other trees growing or being on the public lands, said lands being mineral, and not subject to entry under existing laws of the United States, except for mineral entry, in either of said States, Territories, or districts of which such citizens or persons may be at the time bona fide residents, subject to such rules and regulations as the Secretary of the Interior may prescribe for the protection of the timber and of the undergrowth growing upon such lands, and for other purposes: *Provided*, That the provisions of this act shall not extend to railroad corporations.

Sec. 2. That it shall be the duty of the register and the receiver of any local land office in whose district any mineral land may be situated to ascertain from time to time whether any timber is being cut or used upon any such lands, except for the purposes authorized by this act, within their respective land districts; and, if so, they shall immediately notify the Commissioner of the General Land Office of that fact; and all necessary expenses incurred in making such proper examinations shall be paid and allowed such register and receiver in making up their next quarterly accounts.

Sec. 3 Any person or persons who shall violate the provisions of this act, or any rules and regulations in pursuance thereof made by the Secretary of the Interior, shall be deemed guilty of a misdemeanor, and, upon conviction, shall be fined in any sum not exceeding five hundred dollars and to which may be added imprisonment for any term not exceeding six months.

(*To be Continued.*)

The Gold-Silver Mines in Kapnik, Hungary.

Written for the MINING AND SCIENTIFIC PRESS by R. HELMHACKER, Prague.

The mountains on the boundary between Upper Hungary and the northern Transsylvania, in the district (comitate) Satmar (written Szatmar), a by-range of the Veehorlat-Goutin range, are termed also the Northern Transsylvanian Ore mountains, on account of their gold-silver-copper-lead deposits, mined in Nadibania (Nagybanya), Felshebania (Felsobanya), Kapnik — all close to the Transsylvania boundary—as well as in Olahlaposhbania and several other smaller mines worked in Transsylvania. The range consists chiefly of young eruptive rocks, as andesites (propylite), trachyte intruding through older crystalline strata and through strata of sandstone and slatey clay of the Cretaceous and Tertiary series. Their intrusions fall about the time somewhat before and during the Tertiary-Neogæan division. The andesite forms the older of the youug eruptive rocks in Hungary and Transsylvania, piercing to the earth's surface at the beginning of the formation of the lower mediterranean strata—to which may be counted also the uppermost Oligocene-Aquitanian group—to the end of the sedimentation of the Sarmatic-Miocene group. The andesite being not accompanied with extensive stratified layers of tufas, it is supposed that it reached the dry land, while the trachyte (the true trachyte, rhyolite, quartz-trachyte), according to most of the recorded observations, penetrating the andesite, and therefore younger, with its accompanying trachytic tufas, breccias and conglomerates appears to be of submarine origin.

The andesite is a porphyritically developed mixture of plagioclase (oligoclase) and amphibole, with accessory augite, sometimes also with biotite, with quartz or void of it. The andesite without quartz is termed properly "andesite," while the quartz containing rock is the "dacite," which, inclining mostly to decomposition, is termed "propylite," occurring generally in more subordinated masses. The propylites of greenish colors, designed in the earlier times as greenstone, trachytes or greenstone porphyries, pass in the way of decomposition through a brownish variety or a disintegrated rock with brown strings to a half or fully decayed, soft, greyish or greyish-white rock.

The trachyte is made out with orthoclase (sanidine) in connection with oligoclase, amphibole and biotite, without or with visible quartz (rhyolite).

All these varieties of eruptive rock were found together, but the propylite is always subordinate in its bulk. The mines are located in the well-characterized green propylite in its beginning state of decomposition, as well as in the totally decayed varieties, all so distinct from the trachytes and other andesites. The metallic veins are principally recognized in this rock, which therefore may be also termed as the ore-carrying rock, while mineral veins with ores pierce only seldom other trachytes or stratified rock coming into contact with the proper propylite. These features are closely similar to the conditions of ore-bearing observed in the Rocky mountains in the United States.

In the region of the propylite trend in the Northern Transsylvania Ore mountains are situated the mines above alluded to, from W. to E. forming the Nadibania mining district, with the seat of administration in Nadibania itself.

The village Kapnik, also Kapnikbania, 20 km. east from Felshebania, is situated at the altitude of 800 m. in a gulch-like dale sloping down from the Goutin mountain, 1447 m. high; the brook in the dale forms the Hungaro-Transsylvanian frontier. In the village itself are seen outcrops of green propylite and grey trachyte dikes connected with contact and friction breccias and conglomerates of them, all penetrated again with dikes of grey trachyte of posterior formation. The young Miocene strata with congeria fossils deposited in the vicinity of this place, witness the not remote age of the trachytes connected with them. The two distinct systems of metallic veins recognized here are bound to the propylite rock. The first group of fissure veins trending from E. to W. comprises the thick metallic veins near the junction of propylite with the younger trachyte and its contact breccias, the second system of thin fissures forming at present metallic veins; extending from NE. to SW. is the younger one, sometimes displacing veins above mentioned by faults. According to the observations, dikes and contacts of trachyte with the older propylite are not recognizable in the vicinity of the veins of the second system.

Both of the vein groups are characterized distinctly. The veins in the older system are like to the veins in Felshebania, in case they are poor in quartz. They form friction conglomerates or rather breccias filled with decayed rubbish of volcanic rock and clay, cemented together either with a rock of trituration or with metallic ores and minerals, from which quartz constitutes the large part. In case the quartz is wanting in the vein breccia, which rarely takes place, the metallic ores are attached immediately on the decomposed friction fragments or between them. Only thus, and by no means in another manner, the realgar occurs in these thick fissure veins. But more frequently the ores form vein-like strings traversing the cemented disintegrated fragments in the breccia veins, but most of the ores occur on such places where the veinstone is throughout impregnated with quartz or hornstone.

The second system of veins trending to 2 h. or 3 h. —that is NE.—is the principal object of the mining industry in Kapnik. The vein system is made out of 14 veins, with its strings nearly parallel to each other, ½ to 3 m. thick. In average, the distance of one vein from the other is about 220 m., though some of them are distant from each other only 80 to 150 m. Their dip, though, to one or the other side is great, approaching to a right angle, mostly to SE. with 60°–80°, and in some cases even vertically. As the veins trend all nearly parallel, they are developed by a main deep adit 2000 m. (Ferdinandi adit) long crosscutting them. The older adit, about 100 m. higher, is longer, about 6000 m. Some of these veins, though only eight of them are workable, known to 1000 m. in their length, are developed in the direction of their strike to more than 800 m.; but in NE. direction they are generally not so promising, and assay low.

In all the veins, without exception, tetrahedrite is occurring; but other five veins bear generally auriferous and lead ores; in three of the veins lead ores and gold are only subordinated; in four veins the tenor of gold is better, but their yield in lead only weak. Generally the veins with prevalent tetrahedrite assay lower in gold, those with lead ores higher in gold. The quartz is a conspicuous ingredient of the gangue; also hornstone with thin impregnation of auriferous pyrite, and beside this with thin rents or ledges from 2 mm. to 1 m. thick, filled with ores. Though the thin ore strings pierce only the quartz forming the brood of the vein, they sometimes furcate in the side walls also impregnated with quartz. The quartz percolations of the country rock become more and more scarce with increasing distance in the adjacent rock from the vein, till the decomposed propylite appears without any charge of impregnating silica.

As fissure veins the mineral deposits frequently exhibit a banded structure in the materials which form them, which feature is produced by the deposition on their walls of successive layers of different minerals. But as the fissures or rents in the vein already entirely or partly filled were formed consecutively, either enlarging and opening the old fissures or forming new ones, the new rents were filled with other minerals in the same way as the first, mostly with a new generation of quartz or amethysts in handsome crystals, also with hornstone or other ores, piercing the old veinstone. The minerals from this mining place are known for their handsome forms, and may be found in all the greater mineral collections.

The quartz constitutes a large part of the material composing the veins, then follows the hornstone and dialogite (manganese carbonate) as second in quantity; calcite and baryte are also common. The metallic minerals composing the value of the veins are auriferous pyrite in impregnations or in free developed crystals and chalkopyrite, both also in small strings or a network of strings in quartz, accompanied with galenite and sphalerite as two less frequent occurrences. Other ores are: tetrahedrite, argentite, Stephanite, Redruthite, polybasite, pyrargirite, native gold and silver. More seldom are amethyst, dolomite, gypsum, antimonite, realgar, native arsenic, and many others. Peculiar for the Kapnik veins is the pink-colored vein gangue by dialogite, or intimate mixtures of quartz with dialogite deposited at once, in which quartz-dialogitous mixture, forming, except the breccia-form inclusions of decomposed wall rock, almost the entire mass of the veinstone are imbedded grains of sphalerite, further nests of white quartz including galenite, also with tetrahedrite, Bournonite, both forming often crystals in drusy cavities.

The successive formation of minerals exhibited in the veinstones shows, beginning with the oldest formed, the series: (1) dialogite, then (2) hornstone, (3) quartz; after this, as the vein had been filled, it was again opened by rents and the newly formed fissures were formed with newer minerals from which is the oldest, (4) galenite and pyrite. Other veinstones exhibit the mineral succession: (1) quartz, (2) the seldom Nagyagite (pronounce nadiakit), (3) dialogite. Also: (1) dialogite, (2) quartz, (3) galenite, (4) sphalerite, (5) younger dialogite, (6) younger quartz. Another succession: (1) quartz, (2) dialogite, (3) quartz, (4) dialogite with included tetrahedrite. — (1) quartz, (2) dialogite with included galena and sphalerite, (3) quartz, (4) dialogite, (5) quartz, (6) dialogite.— (1) quartz, (2) dialogite with included Redruthite (chalkosite), (3) quartz, (4) dialogite, (5) quartz, (6) dialogite.— (1) quartz, (2) alabandine (Mn. S.), (3) brown sphalerite with pyrite, (4) dialogite, (5) sulphur.— (1) Nagyagite, (2) dialogite, (3) native arsenic, (4) sulphur.— (1) quartz, (2) sphalerite, (3) tetrahedrite with chalkopyrite, (4) quartz. — (1) quartz, (2) tetrahedrite, (3) honey-yellow sphalerite, (3) chalkopyrite, (5) quartz.— (1) quartz, (2) native arsenic, (3) realgar, (4) baryte.

The vein system with NE. direction is worked by the State itself in a claim of 2720 ha. Rail tracks below ground are 21 km.; hoisting engines, two with 17 H. P. The dressing of the cobbed ore is done in one battery of twelve stamps, two crushing rollers and two jiggers. The savings are pulverized in two jaw crushers and four crushing mills with 108 ordinary and 60 revolving stamps, in pointed trunks; 34 percussion planes of Rittinger, 6 common plane tables, all run with a Girard partial turbine of 108 H. P., and 11 water wheels of 68 H. P. In mining are engaged 9 officers, 324 miners and 28 boys. The average yearly production taken for the years 1890–95 was: 15,890 ts. cobbed ore, 1144 ts. savings, all giving 1262 ts. tailings with a yield of 18.8 kg. Au, 1619 kg. Ag, 10 ts. Cu, 130 ts. Pb, presenting a value of 177,000fl. The mining production differs from the smelting works' production, because the last reduce also auriferous pyrites from other mines.

The average yearly production of Kapnik in the space of time from 1857–96, during 40 years, was: Cobbed ore, were raised 14,095 ts.; savings, 600 ts., giving 1304 ts. tailings with the yield of 15.6 kg. Au, 1588 kg. Ag, 8 ts. Cu, 171 ts. Pb. The yearly returns were in average 197,910fl. raw income, the expenses 183,664fl., the net profit 14,246 fl.; but for the last years resulted a loss.

The system of thick veins going from W. to E. is developed only by one mine, operated by a private owner, in claims of 751 ha. with 2½ km. underground rail tracks. The savings are dressed on the walking floors with jigs and a French stamp work. The production by 5 officers and 178 miners reached 8400 ts. savings with a yield of 7 kg. Au, 2½ kg. Ag, and 725 ts. tailings, in the value of 39,000fl.

The State, as operator, reduces its own and other ores bought from private mines in the reduction works at Kapnik, giving work to 103 men and 9 boys. The ores yielding more than 10% in lead are smelted in blast furnaces, which process presents nothing particular.

The poor dressed lead ores from Kapnik were difficult to reduce on account of their formidable amount of sphalerite, wherefore the hot reduction process was substituted by an extraction process for utilizing such ores poor in lead, rich in sphalerite, and, as much as possible, low in gold; while the other ores, rich in Cu, Pb and precious metals were smelted as usual.

The new extraction process, since ten years in use, was successfully accomplished by Bichansky (Bittsanski); Kurovsky, the superintendent of the reduction work, and, following him, G. Kroupa, made communications of this process, solved in the Kapnik reduction work by the first.

The newly introduced leaching process, a combination of the Augustin and Patera methods, involves the following operations: The ore is roasted by chlorination, then leached with a solution of natrium-chloride; the residue from the first leaching is lixiviated a second time with sodium-calcium hyposulphite. The two solutions are treated separately; in the first or the natrium-chloride liquor the solved metals are precipitated by means of iron scrap; in the second or hyposulphite solution the metals are precipitated with a solution of calcium-natrium sulphuret immediately before prepared. In the first case the metals are precipitated in the metallic state; in the second, metal sulphurets were obtained. Both of the precipitates are smelted in furnaces.

To accomplish these processes of roasting and leaching, the following operations are to be performed: (a) The dressed ores destined to be utilized in the extraction plant are mixed and dried. (b) When dry they are sieved, (c) and mixed with (ground) common salt, (d) and effecting only a partial roasting by the heat of the sulphur contained in them when burning. (e) After this the partially chlorinated ores are again sieved. (f) The residue (baked ore) passing out through the meshes of the sieves is crushed and ground in mills. (g) The partially roasted mixture is reroasted and rechlorinated in reverberatory furnaces, (h) which is followed by two lixiviations, first, a solution of common salt and the leached residue with hyposulphite of natrium-calcium. (i) The precipitation of Au, Ag, Cu, Pb in the first leached portion by means of scrap iron, (j) and in the second hyposulphite solution by adding calcium-natrium sulphurets, and thus throwing down Au, Ag, Pb sulphurets. (k) The precipitated (cemented) metals with iron are washed and dried; (l) the sulphurets-bearing precipitate is taken off and dried. (m) At last, the fly-dust formed by converting the ores into chlorides by the roasting process, is gathered and leached out with hot water.

The leaching liquors are made separately. The salt liquor is made in solving common salt in a vat with warm water to the strength of 20° to 22° B. The natrium-calcium sulphuret is to be prepared immediately before performing the precipitating process, as the solution is able to decompose when exposed to the air by oxidation in a short time; therefore, to prevent this inconvenience, only such an amount is to be composed as sufficient for one sole precipitation. In boiling sodic hydrate and quicklime (calcic hydrate) with sulphur (flowers) and water in an iron kettle results the Na_2S+CaS_5 natrium sulphuret, calcium peuto sulphuret for: $2NaOH+Ca(OH)_2+S_{10}+H_2O=Na_2S+CaS_5+H_2S+SO_2+H_2O$. On exposure to the air the sulphurets oxidate in the

hyposulphite salt as: $Na_2S+CaS_5+H_2O+O_6=Na_2Ca(S_2O_3)_2+S_2+H_2O$.

The plant in the extraction mill, in several buildings on terraces placed one on a deeper level below the other, to treat 3000 ts. yearly, is as follows: There are 18 self-acting (self-heating) furnaces, in sets of 6 furnaces, each one with seven working compartments. The mixed ores, before roasted, are dried on boiler plates which cover the flue dust chambers. The ores destined to be treated by extraction, about 2000 ts. yearly, are to one-half silver ores and to the other half sulphureted tailings mixed in such a manner to contain sulphur, as much that 45% would result. The average yearly test of the mixed charges is: Pb=2.5%, Ag(+Au)=.057% (in 1 kg. Ag+Au are contained .006 kg. Au), Zn S=18%, Cu=3% and matte 45% (from pyrites). By testing the ores, amounts of Cu and Pb below ½% are neglected. To perform the chlorination, the ore charges are mixed with 16% salt; but the salt is added to them in intervals, as, 6% immediately, 6% on the fourth operating compartment; the remaining 2 and 2% are added later. The furnace charge with the first 6% salt admixture is made once in 50 minutes at 1 metric cwt., and every 50 minutes a charge of 1 cwt. is drawn from the furnace, giving thus 28 8 cwts. in a day for one group or 89.4 cwts. for the whole set, or, in a year with 300 working days, 2592 tons of partially chlorinated ore.

The partially chlorinated ore with two admixtures, a 6% of NaCl, is mixed with 2% Nall before charged in the two reverberatory furnaces, each of them with two working compartments, where it is heated during four hours. Immediately before it is discharged from the furnace, the last 2% Nall and 1% of manganese dioxide (MnO_2) are added. The quantity of the heated or completely roasted ore in 24 hours is 60 cwts., giving in a year 3600 ts.

In the burning house are 20 cooling holes (pits) with a capacity of 12 cub. m. for the hot charges, and beside this the furnaces are connected with a 176 m. long system of fly-dust chambers.

The last admixture of salt with MnO_2 shall accomplish the chlorination process as: $4NaCl+MnO_2+2SO_2+O_2$ give $NaSO_4+MnCl_4+Cl_2$, the chlorine which is disengaged and attacks the ore, perhaps not yet chlorinated. The presence of much combined Cu facilitates the chlorination process. The cost of the roasting-chlorination per 1 cwt. is 48 kreuzer; the cost of labor in the self-heating furnaces amounts to 26 kr. and for the heating in the reverberatory furnaces 22 kr. per 1 cwt. treated ore. The chlorinated charges contain: Ag Cl, Cu Cl, Cu_2 Cl, Zn Cl, Pb Cl, Fe_2 Cl_3, Na SO_4, Na Cl and insoluble oxides.

The roasted or chlorinated ore is leached with 20° to 22° B strong salt solution, in 20 leaching tanks with a capacity of 12½ cub. m. or a bottom of 245 sq. m., during 4 days, acting on charges of 3 ts. Monthly are leached 300 ts., yearly 3000 ts., chlorinated ores. The salt solution dissolves a great bulk, namely 76 to 68%, of the easily soluble chlorides, leaving a residue of .012 to .016 kg. Ag+Au in a burden of 1 cwt.

After this the lixiviation residue is releached during two days with natrium-calcium hyposulphite, solving the chlorides, more difficultly soluble in common salt, as: Agll, Au_2Cl_3, ZnCl, etc. For instance, Agll gives: $4NgCl+(3Na_2S_2O_3+3CaS_2O_3)=Ag_2Ca_2(S_2O_3)+Ag_2S_2O_3+2NaS_2O_3+Na\,ll+CaCl_2$; or, Au_2Cl_3 gives: $3Na_2S_2O_3+AuS_2O_3+(3CaS_2O_3+Au\,S_2O_3)+H_2O$. The final residue heaped on refuse dumps test in 1 cwt. .001—.002 kgAg+Au (in 1 kg Ag are contained .006 kgAu).

The basin for accumulating the salt solution has a capacity of 36 cu. m.; that for $Na_2Ca(S_2O_2)O_2$ is constructed in the earth from concrete with a capacity of 18 cu. m. The solutions of the two leaching liquors, the common salt and hyposulphite, are conveyed from distributing vats situated on the second floor of the building and raised from the accumulation basins by means of pumps, each extra for both of the two solutions.

To precipitate the metals from the solution of the metallic chlorides in salt the liquid is treated in thirty-three sets of 462 spherical precipitating basins made of earthenware ½ m. in diameter, ⅔ m. deep and 117-liter capacity, placed side by side and one below the other. The solution is circulating in 3 cm. lead pipes, reaching nearly to the bottom of each basin filled each with 160 kg. old scrap iron, and all total with seventy-four tons iron. The precipitation is further done in twelve precipitating tanks, each one 4 m. long, 40 cm. wide, all of them filled with 11.5 tons scrap iron. They have partition walls to convey the solution in a meandering way in them. The iron in both these appliances precipitates the metals, by which about 15% of the iron bulk is solved or consumed in a year. The silver chloride treated thus by precipitation is decomposed to: $2NaAgCl_2+Fe=FeCl_2+NaCl+Ag_2$.

The solution from the repeated treatment with $CaNa_2(S_2O_3)O_2$ is filled in sixty-five oak vats of cylindrical form 1 m. in diameter, 1⅔ m. deep and a bulk of 1 cu. m.; here to the solution is added a fresh supply of the sodium-calcium sulphuret solution kept ready in twelve vats. The settlement of the precipitate of metal sulphurets is done in two settling tanks. The chemical process thus performed, for instance, to free the silver solution from metal is: $Ag_2S_2O_3+Ag_2Ca(S_2O_3)+(Na_2S+CaS_5)=2Ag_2S+NaS_2O_3+3CaS_2O_3+S_4$.

It is seen that the hyposulphides are not to be formed as they are obtained as by-product by the decomposition of the sodium-calcium sulphurets. The precipitated (cemented) metals are removed in several weeks, the precipitated sulphurets every fortnight and dried afterwards.

The precipitating treatment gives an output of 18%, the sulphuret precipitation an amount of 1% on total 28%, exhibiting also a 36-times concentration of the metal bulk contained in the ore before the treatment by the leaching process. The composition of the precipitated metals is thus: 1 cwt. yields 2.265 kgAg+Au (in 1 kgAg+Au is the tenor of Au=.0013 kg) 18–20% Cu. and 15 to 16% Pb. The precipitated sulphurets yield in the average in 1 cwt.: 1.3 kgAg+Au (in 1 kgAg+Au is the Au tenor .010 to .012 kg) and 4–5% Pb.

Both of the products resulting from the treatment of poor lead ores, as the precipitated metals and sulphurets, are desilverized in adding them to the molten weakly argentiferous lead, when subject to the cupellation. The lead in the way of cupellation combines with 30% of the added precious metals, while 70% of them go in the copper, yielding skimmings of the lead. The argentiferous lead yields 1–2 kg. of auriferous silver per 1 cwt. and is cupelled. The skimmed cupriferous litharge (lead) is smelted in a blast furnace with other lead products or lead ores with quartz and iron to argentiferous lead with .4 to .5% Ag (+Au), by which reduction process is obtained a matte yielding 25 to 30% Cu., 8 to 10% Pb. and .08 to .10% auriferous silver.

At last the flue dust collected in quantities amounting to about 3% of the ore treated in the chlorination furnaces is recovered. The dust yields: Agll, AgO, $AgSO_4$, Au_2Cl_3, AuCl, Au; CuCl, Cu_2Cl, CuO, $CuSO_4$; PbCl, PbO, $PbSO_4$; ZnCl, ZnO, $ZnSO_4$, and is leached out with boiling water, and the solution precipitated with iron. The precipitate yields in 1 cwt. .1 to .11 kgAg (with Au), 15–20% Cu, 10–12% Pb. The leaching remainder contains .07–.075% Ag (+Au; Au=.04), 15–16% Pb., and is reduced on the dry way in the melting rock.

The cost of extracting the ores is per ton 9.22fl.; the total cost of extracting and smelting one ton, inclusive the cupellation, inclusive the lead reducing, but less the administration expenses, is 11.6fl. The cost of the plant for treating 3000 ts. poor ores is 82,000fl., namely for self-heating furnaces 11,000fl., for reverberatory furnaces 4000fl., cooling pits 2200fl., for the leaching plant 60,000fl., and for other work done 5000fl. The net profits of the extraction work in the year 1894 amounted to 7940fl.

In the year 1894 were treated in the extraction work: (1) Argentiferous ores 734.8 ts. with auriferous silver=463.8 kg. (Ag=465.1 kg, Au=1.3 kg.) and with copper and lead in quantities below ½% and therefore not tested. (2) Tailings containing sulphur (pyrites) 684.3 ts. with 399.1 kg. auriferous silver (395.8 kg. Ag, 3.2 kg. Au), 3 8 ts. copper and lead below ½%. All the ores treated were therefore: 1428.1 ts. with auriferous Ag.=859.7 kg. (Ag=864.24 kg., Au=4.57 kg.) 38 ts. Cu. and Pb. below ½%. The production in the several products collected separately was:

In the precipitated metals, 26.6 ts. containing: 599.8 kg. auriferous silver (Au=.747 kg., Ag=599 kg.) Cu=4.77 ts., Pb=3.58 ts.

In the precipitated sulphurets 14.12 ts. yielding: 181.4 kg. auriferous Ag (Au=2 33 kg. Ag=179.1 kg.) and .5 ts. Pb.

In the flue dust 48.4 ts. yielding: 35.2 kg. auriferous silver (with Au=1.33 kg. Ag=34 kg.), .15 ts. Cu and 10.9 ts. Pb.

In aggregate were collected products: 89.07 ts. with 816.4 kg. auriferous silver (with 4.4 kg. Au, 812 kg. Ag), Cu=4.92 ts., Pb=19.97 ts. If the returns are subtracted from the yield of the ore destined to be treated there results a loss of auriferous silver 47.8 kg. (loss of Ag=47.6, of Au=.16 kg.) by neglecting the base metals in the ores not accurately tested.

The returns of precious metals furnished from the precipitated metals is: Ag=69.7%, Au=16.3%; from the precipitated sulphurets: Ag=20.8%, Au=51.1%; from the flue dust: Ag=3.9%, Au=25 6%.

The total yearly production of the melting and extracting works amounts to about: 55 kg. Au, 1700 kg. Ag, 19 ts. Cu., 134 ts. Pb., at the value of 256,000fl.

The Witwatersrand Banket, With Notes on Other Gold-Bearing Pudding Stones.*

NUMBER VIII.

By GEO. F. BECKER.

On the Pacific coast the gold is commonly associated with black sands, consisting largely of magnetic iron oxide or titanic iron ore. On the Rand, magnetite, though not absent, is relatively rare. It does not follow that the deposits of the two regions are not similar. The magnetite on the Pacific beaches does not originate to any extent in the gold-quartz veins, but in country rock. If the country rock happened to be poor in magnetite, the sands would not be black. Such seems to have been the case in the Jurassic gold-bearing marine conglomerate of Placer county, California. Again, the magnetite may have been in part converted into pyrite by the sulphur-bearing solutions accompanying the intrusion of the dikes.

The beach sands on the Pacific coast of North America and those of New Zealand form along the shores of extensive gold-bearing regions. It is natural that they should so form; it is difficult to comprehend their entire absence, and it is hard enough to understand why they are not more abundant. What has become of the immense quantity of gold swept away by erosion from the western slope of the Sierra Nevada and the auriferous territory of northern California? It has certainly been carried to the sea, and, as a heavy metal, some of it has been left along the coast in the beach sands. The aggregate quantity of gold in the sand is very great, but I see no probability that it represents more than a small fraction of the gold which has been scattered by Nature's hydraulic process. The only answer is that the metal has been so triturated, so "floured," that it has been swept away into the abyss of the Pacific slope and perhaps slightly dissolved in the waters of the ocean. Just as very fine gold cannot be saved in a sluice, so still more finely comminuted gold must remain suspended almost indefinitely in ocean currents.

Now, at the time of the formation of the conglomerate the Witwatersrand lay along the shore of an extensive auriferous area, presenting belt after belt of quartz veins striking in a direction nearly parallel to the coast. The drainage probably cut across this area, bringing down auriferous detritus. The streams certainly brought down vein quartz from a gold-bearing country. This supply was more abundant at some times than at others, the variation probably representing fluctuations in the gradual upheaval of the land area. It is clear that vigorous currents swept the shore, for otherwise such accumulations of conglomerates could not have been formed. Here, then, there were all the conditions for the formation of beach placers. It might have been predicted *a priori* that, if littoral deposits could be found within a moderate distance to the southward of the area of Mashonaland, Matabeleland and northern Transvaal, they would be nearly certain to show alluvial gold.

It has been argued that, if the deposits of the Witwatersrand are ancient beaches, they are substantially unique. It is certainly true that they are the richest of such deposits ever known, but geologically and qualitatively they by no means stand alone. Europe, America, Australia and New Zealand all possess auriferous marine gravels of pre-Tertiary age. Ancient river gravels would be preserved only under exceptional circumstances, and it is doubtful whether a single case of pre-Tertiary gold-bearing river gravels is yet known. It is interesting to compare other old gold placers with the deposits of the Witwatersrand, and for that reason notes on some of them are added to this paper. They certainly reenforce the argument for the alluvial origin of the gold in the banket, and it may be noted that nearly all of these deposits lie in the regions known to contain gold-quartz veins older than the marine strata.

Let it be assumed, for the sake of argument, that the banket really represents a marine placer of early Paleozoic age, formed off the shore of an extensive gold-bearing region, and since injected with dikes. One would then expect to find the gold in the coarser streaks of the resulting conglomerate and on the lower side of such streaks. The reef would extend for many miles, and perhaps for many hundreds of miles. The tenor would depend in part on the strength of the currents sweeping along the coast, and in part on the quality of the material fed into the sea at different points, or at the same point during different seasons. Hence, conglomerate of a given coarseness would be richer at some points than at others, and there might be almost barren portions or beds, but the distribution would be in patches, not in chutes. The gold would almost all be finely divided, for nuggets would commonly remain in the rivers. Pyrite would almost certainly appear in the sands, but experience shows that gold-bearing pebbles would be rare. When the conglomerate was upheaved, injected with dikes, and metamorphosed, it would be found that the dikes sometimes cut poor patches and sometimes rich ones, their disposition having nothing to do with the original distribution of the gold. The sandstones would be converted into quartzites, and re-crystallization of gold and pyrite would occur to some extent. In short, it seems to me that deposits exactly analogous to those of the Rand must form in this way, while in some details the composition of the banket would doubtless depend on the lithological character of the back country.

Thus, it seems to me that there are no valid objections to the theory of marine placer origin and no noteworthy features left unexplained by this theory, while so much cannot be said of either the impregnation or the precipitation theory. The beach deposits of the Pacific form an excellent instance of such marine placers, although they are not so rich as those of the Rand. On the other hand, no case is known of an extensive gold deposit which is certainly an impregnation in sand or gravel, nor is there an established case of marine precipitation.

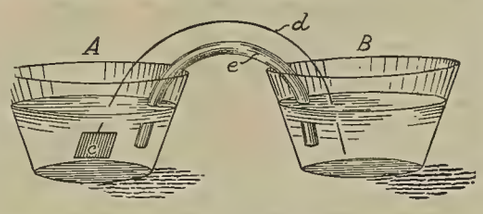
*Eighteenth Annual Report Mineral Resources of the United States.

Chemistry of the Cyanide Process.

Professor Faraday in 1857 informed the scientific world that gold leaf, as resting on the surface of a solution of potassic cyanide, dissolves about one hundred times quicker than gold leaf that is wholly immersed therein—a fact taken advantage of by cyaniders for a rough and ready test of the strength of their cyanide solution. Faraday stated that "air voltaic currents are formed in these cases" (the cyaniding of gold resting on the solution), "and the gold is dissolved almost entirely under their influence." Another theory is that taking cognizance of the fact that oxygen is a necessary factor in the process, and is far more plentiful at the surface of the cyanide solution than in the solution itself, this rapid dissolution of gold at the surface is due to the plentiful supply of oxygen. M. Maclaurin suggests that it may be considered as only an extension of the under surface of gold in the position described, a theory that, if true, goes to explain the particular phenomenon under consideration. This theory maintains that there is generated at the surface of the cyanide solution on which gold is resting a current of electricity, and that this current causes the solution of the gold, that "the solution of this gold is due to electrolytic action obtained by the action of the cyanide and the oxygen of air," a hypothesis still under discussion.

Wm. Skey holds that the "air voltaic current" theory is not tenable. If the gold leaf and the surrounding cyanide solution be covered with a thick layer of kerosene or gasoline, the dissolution of that gold is but little retarded. Ether can be substituted for these oils with like effect if only the cyanide solution is very strong or has been heavily salted to prevent the downward diffusion of the ether, and so favor the existence of a hard line of demarcation between the two liquids. All these substances are permeable by oxygen; still, apparently, not notably more so than water is. But the same results happened when they were depleted of their contained gases by passing coal gas through them, and even when the gold leaf itself was also depleted more or less of the air lodged in its pores by the same gas, which goes to prove that, for the rapid dissolution of gold leaf on the cyanide solution, a body of air resting on that solution is not necessary; that there is entangled in the pores of the gold leaf, or mechanically absorbed by it, a sufficiency of oxygen to provide for a rapid dissolution of the metal.



This raises the question, Why should gold leaf in a cyanide solution be very much longer in dissolving than gold leaf lying on the surface, and under a layer of oil or ether, the necessary supply of oxygen being in each case, as it were, afoot—that is, lodged in the gold leaf? The answer is: A piece of gold that is immersed in a cyanide partly-solution, weak or strong, not only dissolves rapidly at the surface of that liquid, but also rapidly—often just as rapidly—in the liquid itself, and even at those parts that are quite distant from the surface.

The part of the gold leaf that is immersed in the cyanide solution may be viewed as merely an extension of the under surface of the gold leaf that lies on the surface of this solution. Gold in strong solutions of the cyanide is always positive to gold in weak solutions of this salt, and the current thus generated is sufficiently strong to give electrolytic effects—the deposition of copper and gold from their sulphate and chloride, respectively. These results, while showing that the rapidity with which gold dissolves when lying on a cyanide solution is not due to the generation of any electrical current at all, shows just as clearly the fact of the potency of cyanide solutions of different strengths in contact with the gold for accelerating the cyaniding of the metal; and the inference is that the rapidity with which this surface gold dissolves is in greater part, if not wholly, due to the action of cyanide of different strengths—to the action of the stronger solution on the under surface of the leaf, its upper surface forming in the weaker cyanide the negative pole.

If differentiation of the strength of the cyanide solution does explain the rapidity with which gold, as placed on a cyanide solution, is dissolved, differentiation in strength must be a factor in the dissolution of gold in tne cyanide process generally. The percolation of the cyanide solution through the charge—this "drip, drip, drip"—in a damp atmosphere, is all favorable for its production and maintenance. Thus the cyaniding of gold appears to Mr. Skey to be eminently an electric process; not that the gold is dissolved therein by means of electric currents, but that it generates these currents. He claims that the dissolution of gold in the cyanide is analogous to the dissolution of zinc in the sulphuric acid of a Smee's cell. If means are not present for the production of the voltaic circle, no pronounced, no regular, action takes place—it is merely a difference in the construction and the arrangement of the cell. Thus, in the Smee's cell it is one solution and two metals, but in the cyanide process one metal and one solution at the start, which solution becomes of various strength, and so fulfills the condition necessary to insure the existence of the voltaic circle.

Two theories have been constructed to show how the chemical actions obtaining in the cyanide process are initiated and brought about, one "that the action of oxygen is due to its strongly electric negative relation to gold in the cyanide solution," the other, that the cyanodizing of gold is always effected by a displacement of another metal from the cyanide used by it, that, in fact, "pure alkaline cyanides cannot dissolve gold"—meaning, of course, in the oxygenated solution. To meet this theory one need only ask, What metal or metals are likely to be in the cyanide, or in the auriferous mine stuff itself, that gold could displace from a cyanide solution? Mr. Skey refers to the metals platina, iron, lead and mercury as being negatives to gold in cyanide solutions; but certainly platina is out of the question, while iron would not be replaceable. There only, then, remain mercury and lead, and neither of these is present in cyanide solutions except on very rare occasions. But gold as prepared from its chloride by oxalic acid is dissolvable by the weak cyanide.

Two theories have likewise been formulated to explain how gold becomes dissolved in the cyanide process. One is that given by Mr. MacArthur. This assumes that water is decomposed, its oxygen being used to replace the cyanogen necessary to cyanide the gold, while its hydrogen is evolved. Experiments in this matter give results against this. *A* is a vessel containing potassic cyanide of any strength, in which is a sheet of gold leaf (gummed to paper). *B* is another vessel, containing the acid in water

heavily salted to drive out the oxygen that might interfere with the result. In this vessel is a gold wire *d*, which is connected with the gold leaf *c*. Interpolar connection is completed by the bent glass tube *e* that is full of hydrated, but almost solid, gelatine, slightly salted for conducting purposes, if necessary.

Soon after this arrangement is set up a stream of gas may be observed issuing from the gold or platina wire. This is hydrogen, and the evolution goes on continuously till all the gold leaf is dissolved. It is necessary to have a small cathode and a large anode to be certain of success in the experiment, as cyanodizing is at the best a slow process, and even concentrated solutions of the acids and salts let in oxygen fast enough to oxidize hydrogen to a notable extent, and thus prevent its liberation being noticed.

These results show that hydrogen can be liberated in a cyanide process, and that in the process as carried on the gas is not evolved, but transferred in a liquid form to the oxygen present at the anode. The process demands that the oxygen shall be present and in quantity, while the alkalinity of the solutions favors the rapid union of this gas with oxygen before it can assume the gaseous form, or even before it can in reality become free.

The next theory to explain the chemistry of the process involves the decomposition of potassic cyanide, the cyanogen combining with the gold as before, while its potassium combines with oxygen gas as present in the solution. This view appears reasonable, until one takes cognizance of the fact that he can, by a slight modification in the process just described, get an evolution of hydrogen—that is, by transferring the negative gold—the negative pole—from its alkaline to an acidic solution.

In the cyanide solution one has not the simple compound potassic cyanide to deal with, but the hydrocyanide of potash, corresponding to the hydrochloride of potash. On one hypothesis the cyanodizing of gold is a combination of two simple operations. The affinity of gold for cyanogen and that of oxygen for hydrogen in the presence of an alkali conjointly determine the decomposition of the hydrocyanic acid, a gold cyanide forming at the one pole and water at the other. This constitutes the first operation. The dissolution of the cyanide by a portion of the remaining potassic cyanide is the second operation. In the first operation there is no precedence in action at either pole; the electric action at each pole commences simultaneously. True it is that to the old idea of voltaic electricity as a current it is not easy to reconcile one's self to the thought of a simultaneous start of electricity at each pole; but with a belief in Faraday's theory, that such electricity is only a polarization, it appears that this is the only way the action is started.

A singular phenomenon may be observed in regard to the action of the cyanide solution upon gold. The gold is deposited from very weak solutions of its chloride by phosphorus or hydrogen in such finely divided particles that they are indistinguishable—in fact, invisible—under the microscope, and are able to remain in suspension in water for an indefinite period. It was only by reflected light that Faraday could observe them. If we neutralize, or slightly alkalize, this red-looking auriferous fluid (one cannot designate it as a solution), then divide into two parts, and mix one part with, say, three volumes of the dilute solution, and mix the other part with a strong cyanide solution—say, the concentrated solution—it will be found that it is the gold in the strong cyanide that first disappears from view. Nor is it a neck-and-neck affair by any means, for in the strong solution three seconds may suffice to complete the operation, while in the case of the orthodox dilute solution the time required will be about five minutes—that is, about one hundred times longer. This is, of course, just what one would have expected a few years ago, before our working cyaniders had taught us the extraordinary potency of the dilute solution over the strong solution as a gold dissolver. Both the blue and the red gold of Faraday give these results.

These results seem to indicate that even in the supposed inert solutions of the cyanide the strong solutions rapidly act upon gold to a limited extent. It is not a matter of superior causticity, for it was found that strongly alkalizing the weak cyanide did not hasten the dissolution.

The explanation of this enigma may be this: In the strong solution cyaniding goes on at once, but only so far as to produce a colorless cyanide of gold that is insoluble, or but very slowly soluble, in the liquid. Gold taken out of a strong cyanide solution refuses to amalgamate, or, at least, very slowly amalgamates, showing that an insoluble saline film of some gold cyanide has enveloped it. Gold leaf upon a strong cyanide solution, in disappearing, leaves floating thereon a pale white ghostly-looking figure of its departed self. In the case before us, however, there is no transmutation of a vast number of metals—nor even of one; the white floating mass left by the gold is its cyanide, and it is believed to be this substance that always forms upon gold in strong cyanide solution, thus preventing or retarding its dissolution.

Smelting in Colorado.

The smelting situation in Colorado in the early part of '97 was about as follows: There were being smelted by the three smelters in Pueblo about 1500 tons daily of ore; by the two smelters in Denver, 900 tons; by the two smelters in Leadville, 900 tons; by the smelter in Durango, 130 tons; by the smelter at Silverton, 100 tons. The treatment charges on the ores smelted vary materially.

For silicious silver ores, averaging about 65 per cent excess silica, the smelters paid for 95 per cent of the silver, $19 per ton for gold if .05 ounces or over, and from $7 to $9 treatment charges.

On gold ores from Cripple Creek district, $20 per ounce for gold, $10 treatment charge.

On lead ores from Idaho, 95 per cent of the silver, 90 per cent of the lead, $7 for treatment.

Sulphide ores, 95 per cent of the silver, $19 per ounce for gold if .05 or over, $7 treatment charge; neutral 15 cents allowed for excess iron, and 10 cents charged for the excess silica.

Iron ores were usually bought at Leadville, the smelters paying 95 per cent of the silver, and an average of 75 cents per ton treatment charge on a 40 per cent excess iron basis.

For a long time past smelters were embarrassed by shortage of lead ore in comparison with the quantity of dry gold and silver ore treated. This has been the case to such an extent that it has not been unusual to run on an 8 to 10 per cent lead charge. Unless silver drops to a point which will dislocate Mexican finances, the economy of operating a mine in a silver country will stimulate the export of lead ores to the United States, notwithstanding the import duty—more especially if that lead be reexported and a rebate of the duty thus secured. The lead production of the United States from native ores was in 1896 about 174,692 tons, of which 130,000 tons were extracted from pure non-argentiferous ores. The amount, though large, was insufficient to supply the demand; for though in 1896 64,882,202 pounds were exported, 187,522,267 pounds were imported. The foreign supply can most advantageously be drawn as ore from Mexico and Canada. The customs returns for 1896 show that between 6000 and 7000 tons of lead came into the United States from Canada, and the balance from Mexico, the Canadian ores coming exclusively from British Columbia. The river and lake system of southern British Columbia is such that the readiest outlet is to the United States; argentiferous lead ores, unless of most desirable composition, can only be treated with a maximum of economy and accuracy of saving when a mixture can be secured, and this is best effected when supplies are drawn from many sources.

MANY mechanics have had their patience tried when pouring lead around a damp or wet joint to have it explode, blow out, or scatter from the effects of steam generated by the heat of the lead. The whole trouble may be avoided by putting a piece of resin the size of a man's thumb into the ladle and allowing it to melt before pouring.

Coast Industrial Notes.

—The new railway from Goble to Astoria, Or., will be finished May 1st.

—The orange growers of southern California will receive about $6,000,000 for this season's orange crop.

—California shipyards are turning out new iron and wooden vessels for the Klondike transportation trade.

—The Canadian Pacific Railway has made a further cut of 30 per cent in passenger rates. One can now travel from Vancouver to St. Paul for $10.

—The Manufacturers and Producers' Association will hold its regular annual meeting at Room 2, sixth floor, Mills Bldg., San Francisco, on the afternoon of the 23rd inst.

—Los Angeles oil producers' trustees report a new contract with a San Francisco firm for 1000 barrels a month. That brings their total contracts for delivery at San Francisco up to 10,000 barrels a month. They believe they will be able to double this before long.

—The United States Government will next week send an expedition from Vancouver, Wash., to find a practicable route up the Copper river, Alaska, to the Yukon basin. Fifty men and three officers of the Fourteenth Infantry will leave Vancouver on March 15th.

—In San Luis Obispo and Santa Barbara counties, Cal., there remains fifty-five miles of the railway in the Coast division gap to be built. About 1000 men will be put on. It will take ten months to finish. When completed, the through East-bound passenger trains will be run over that route.

—This week President Paget of the Chihuahua & Pacific Railroad Co. signed a contract with the Nassau Construction Co. for the construction of a steam railroad in Mexico from the silver mining regions of Chihuahua to the Gulf of California, 350 miles. Under the terms of the contract 120 miles must be completed before November 1st.

—Trade in California sweet wines shows an increase. The total estimated product for this year is 3,000,000 gallons, 25 per cent more than last year. Heretofore there has been little profit in the vintage because of the fierce competition of growers; the producers have now made arrangements with a sweet-wine syndicate which will control the entire product of the State and give all concerned some share in the profit.

—On the new Siberian railway 5000 miles of steel rails have been laid already at a cost of 350,000,000 rubles. July 1, 1904, it is thought, will see locomotives running from the shores of the North to those of the Japan sea. Within eighteen months trains are to run over the Siberian road to the Amoor river. Thence, by fast steamer, passengers and freight are to be pushed on to Chaborowka; thence, in eighteen hours, over the South Russian section of the Siberian road to Vladivostock, making the distance from England to the most important harbor of the Japan sea seventeen and one-half days. It is estimated that when the road is in working order, after the first few years and high rates of speed across Siberia are attained, the entire trip will be made in nine days and two hours.

—To exporters of merchandise or machinery to Mexico it is of great importance that everything be packed in accordance with the customs regulations of Mexico, and in such a way as to insure an immediate and proper tariff classification. Some of these regulations are different from those of the United States customs houses. Some of them are apparently unnecessary and vexatious, and the energetic American shipper will probably make complaint if he happens to make a mistake and is fined or delayed in his business; but when the American crosses the boundary of his own country he is among a people who do as he does when at home—run their own business to suit themselves. However peculiar their ways may seem, however complicated their red tape may run, no matter how many old-fashioned ways may prevail or how many improvements might be suggested, their way of doing business is their own and they have the right to enforce it. The country is theirs, and the American who goes abroad with fixed standards of comparison, ironclad ideas of how he is going to do business in another man's country, is doomed to vexation, trouble, expense and disappointment. The importance of this matter of packing goods purely for the Mexican market is so great as to be the principal reason why many articles which should be furnished by the United States are still bought in Europe by Mexico. A few American firms have made an exhaustive study of conditions in Mexico and humor the trade in every possible way. The result is they have a large and profitable business which they have earned and which they keep by adapting it to the needs of the country and the whims of the people. The manner in which the trade in packing-house goods has been built up is an excellent illustration of this. It was found by the Armour Packing Company that the empty coal-oil cans were used by the Mexicans to pack lard in. The cans were cheap, of convenient size to handle and easily packed on the back of a burro. The suggestion was sufficient, and now the Armour Company ships lard to Mexico in tin packages made to resemble the regular five-gallon coal-oil can. The whims of the trade are shown in the experience of a New York firm selling large quantities of candles. By persistent work they built a big trade in Mexico. One brand of their candles was especially popular. These candles were wrapped in blue paper and sold in immense quantities. For some reason or other the color of the paper was changed to red. The results were disastrous. The sale of the candles suddenly stopped. Their agents in Mexico told them that the people kept asking for the candles done in blue paper and would take no other, as they could not be convinced they were the same goods. The New York firm finally sent over a lot of blue wrappers and they were substituted for the red ones. The candles again sold freely and the business of lighting Mexican houses with American candles continues with profit to all concerned.

Personal.

MR. CHAS. E. ELLIOTT has been elected Sec. Potosi M. Co.

JAS. GOULD, a mine owner at Gold Run, Cal., is in San Francisco.

D. FISHER succeeds S. Love as Supt. Union Con. mine, Jackson, Cal.

J. O'CONNEL, Supt. McKinley mine, Columbia, Cal., is in San Francisco.

HON. R. H. CAMPBELL leaves San Francisco for Cariboo, B. C., next week.

A. BLUNDELL, Supt. Murchie mine, Nevada City, Cal., is in San Francisco.

O. S. BUCKBEE has resigned as Supt. of the Confidence at Confidence, Cal.

GEO. SCHMITT, Mgr. Nat. Con. mine, Redding, Cal., is in San Francisco.

A. COLBY, owner of the Fair View mine, Sonora Cal., is in San Francisco.

W. SKAGRUN has succeeded J. J. O'Brien as Supt. Washoe mine, Butte, Mont.

M. W. MATHER, Supt. Crœsus G. M. Co., Alleghany, Cal., is in San Francisco.

B. F. HARTLEY succeeds A. M. McDonald as Supt. Montauk mine, New Castle, Cal.

W. H. CLEARY JR., Supt. Petticoat mine, Railroad Flat, Cal., is in San Francisco.

CHAS. BUTTERS will leave Johannesburg, S. A., for San Francisco on the 15th inst.

J. B. HOBSON, Mgr. Horsefly Hydraulic M. Co., Ashcroft, B. C., is visiting San Francisco.

W. F. ENGLEBRIGHT of Nevada City, Cal., is ill at the Hotel St. Nicholas, San Francisco.

S. W. JACOBS, part owner of the Lost Emigrant mine, Summit, Cal., is in San Francisco.

R. T. PIERCE, Supt. May Lundy mine, Lundy, Cal., is in San Francisco, en route to Boston.

H. A. PRESTON, owner of the Preston Hill mine, Sonora, Cal., has returned home from San Francisco.

J. FITZGERALD becomes Supt., and A. Trittenbach, Gen. Mgr., of the Confidence mine, Confidence, Cal.

JAS. E. KEELER was this week elected director of the Lick Observatory to succeed Prof. Holden, who recently resigned.

H. W. FAIRBANKS has returned from an extensive surveying and reconnoissance of 600 square miles of oil-yielding area in southern California.

H. J. REILING, Pres. Bannack Dredging Co. of Chicago, is in California, examining mining properties with a view to dredging operations.

J. J. HALPIN of New York has resigned the presidency of the Brunswick Con. mine, Grass Valley, Cal. He is succeeded by F. J. Fletter of San Francisco.

A. McL. HAWKS, chief of construction of Chilkoot Railroad & Transport Co., has returned from the Chilkoot Pass and reports that the wire-rope tramway will be completed and in operation on the 15th inst.

Recent California Mining Incorporations.

Jamestown G. M. Co., San Francisco; capital stock $500,000, subscribed $1000; J. P. E. Heintz, E. P. Heald, E. J. Molera, E. McAllister, C. Y. de Lay.

Golden Jubilee M. & M. Co., Napa; capital stock $200,000, subscribed $36,000; S. Newcomer, S. Wardner, J. F. Medary, N. Samuels, C. F. Ruse, C. A. Harvey, M. A. McDonald, J. B. Bacon.

Columbia G. & S. M. Co., San Francisco; capital stock $80,000, subscribed $22,000; T. Fox, T. E. Danmeyer, W. A. Hale, E. D. Farish, R. Danmeyer.

Cherokee M. & M. Co., San Francisco; capital stock $300,000, subscribed $500; J. Peckham, T. R. Brown, H. H. Taylor, L. T. Marble, M. S. Martin.

Mexican M. Co., San Francisco; capital stock, $65,000; subscribed, $125; J. Urquehart, W. S. Cronk, D. Sheehan, E. W. Kay, L. B. McMurty.

Virginia Enterprise M. & M. Co., San Francisco; capital stock $250,000, subscribed $50; S. A. Loth, E. O. Jellinek, O. J. Mayer, J. Drossner, F. E. Groessler.

Recently Declared Mining Dividends.

Le Roi, British Columbia, $50,000; payable March 12.

Gold Mountain, Montana, 2 cents per share, $6000; March 5.

The '76 G. M. & M. Co., Colorado, 2 cents per share; payable March 19.

Wildman-Mahoney, California, 10 cents per share, $12,000; payable Feb. 20.

Pennsylvania, California, 5 cents per share, $2575; payable immediately.

Argonaut, California, 10 cents per share, $20,000; March 1.

Morning Star, California, $6 per share, $14,400; March 1.

Portland, Colorado, 1 cent per share, $30,000; payable March 15.

Anchoria-Leland, Colorado, 1 cent per share, $6000; payable March 15.

Calumet & Hecla, Michigan, $10 per share; $1,000,000; payable April 1.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING MARCH 1, 1898.

600,055.—BOTTLE LOCK—S. Adler, S. F.
599,923.—TRUCK—E. C. Atwood, Golden Gate, Cal.
599,824.—COUPLING FOR TAPPET CAMS—T. J. Barbour, S. F.
600,116.—SWINGING COT—J. H. Benning, S. F.
599,926.—CONCENTRATING BELT—W. F. Bowers, S. F.
600,059.—MUD DRUM AND BOILER—W. J. Brady, S. F.
599,830.—STEAM ENGINE—A. E. Cobb, Phœnix, A. T.
600,109.—RING SLIDE FOR ROPES—C. A. Conger, Oakland, Cal.
600,110.—EYE FOR ROPE HALTERS—C. A. Conger, Oakland, Cal.
600,111.—SEWING MACHINE—N. P. Duncan, Hanford, Cal.
599,895.—WRENCH—English & Stranahan, Portland, Or.
599,960.—ENVELOPE—P. E. Gillette, Grass Valley, Cal.
599,898.—CHECK REIN HOLDER—O. Gravelle, Spokane, Wash.
599,701.—GOLD SAVING APPARATUS—G. Griesche, Berkeley, Cal.
599,845.—WATER WHEEL BUCKET—E. P. Jones, Alameda, Cal.
599,847.—RAILROAD SWITCH—B. J. Kelly, Corvallis, Or.
599,717.—PICK—J. H. Maddux, San Luis Obispo, Cal.
599,856.—LEMON SQUEEZER—E. J. Middlekauff, S. F.
599,974.—PNEUNATIC TIRE—O. H. Packer, Junction, Nev.
599,793.—HANDLE BAR—O. R. Pihl, Portland, Or.
599,871.—CLOTHES DRIER—J. L. Siefkes, West Point, Cal.
599,743.—NITRATES—E. A. Starke, San Rafael, Cal.
599,744.—BROOM HOLDER—H. L. Steinmeyer, Sacramento, Cal.
599,745.—SASH FASTENER—H. L. Steinmeyer, Sacramento, Cal.
600,100.—PIPE VISE BENCH—G. F. Tong, Sacramento, Cal.
599,819.—GOLD SAVING APPARATUS—E. L. Weed, Ellensburg, Or.
599,756.—WAVE MOTOR—P. Wright, Los Angeles, Cal.
28,338.—DESIGN, GAME BOARD—G. L. Smith, Patton, Cal.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey. Strong&Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

PICKS.—James H. Maddux, San Luis Obispo, Cal. No. 599,717. Dated March 1, 1898. The object of this invention is to provide easily detachable and removable points for picks, with means for locking them securely to the main portion or stop, so that they cannot be disengaged or loosened by use, while they are easily removable and replacable when worn out. It consists of a central eye, or socket, having outwardly projecting arms with separable points, the meeting ends of the arms and points being halved together in planes parallel with the handle, having longitudinal projecting ribs and channels upon the meeting faces and dowel-pins by which the parts are locked, and a bolt or bolts passing through so as to secure all parts solidly together.

ADJUSTABLE PORTABLE PIPE VISE BENCH.—George F. Tong, Sacramento, Cal.; one-half interest assigned to M. K. Barrett of same place. No. 600,100. Dated March 1, 1898. This invention relates to a portable bench which is especially designed as a support for vises for pipe and screw thread cutting devices. It consists essentially of a heavy table having hinged to its lower surface at the edges legs which diverge widely from their point of hinging to the bench so as to form a wide-based tripod. In conjunction with these legs are brace bars, also pivoted or fulcrumed to the lower part of the bench extending diagonally downward, having clamps by which they are adjustably locked upon the main legs so that the latter are held firmly in place. The lower part of the legs are provided with means to receive transverse bars, which prevent their sinking deeply into the ground, and they also have means for holding them in place.

APPARATUS FOR SEPARATING AND SAVING PRECIOUS METALS.—Gustav Griesche, East Berkeley, Cal. No. 599,701. Dated March 1, 1898. This invention relates to an apparatus which is designed to separate heavy valuable or precious metals from sand, gravel or other gangue with which they may be found associated in a free condition. It consists essentially of a tapering revoluble screen mounted upon horizontal shafts, means for supplying the material to be separated to said screens, semi-circular collecting troughs surrounding the lower part of the screens having discharge chutes opening from them and a series of oscillating troughs inclined upwardly from the receiving toward the discharged ends, said troughs being divided into separate compartments and having independent agitated blades mounted upon the longitudinally centrally disposed shaft and revoluble independently within the compartments with means for varying the inclination of the troughs. A suitable supply device is adapted to deliver the material into the apparatus, and a discharge chute at the end conveys away the worthless material after the separation is complete.

MUD DRUM AND BOILER CONNECTION.—Wm. J. Brady, San Francisco, Cal. No. 600,059. Dated March 1, 1898. This invention relates to an improvement in mud drum connection for boilers. It consists essentially in a means for detachably connecting the drum with one or more boilers, a means for making a more perfect joint between the connecting nozzle and the drum by the use of compensating plates to which the flanges of the nozzles are first riveted, the plates being afterwards riveted to the mud drums.

BOTTLE LOCKING DEVICE.—Solomon Adler, San Francisco, Cal. No. 600,055. Dated March 1, 1898. This invention relates to a device which is especially designed to lock the stoppers of bottles to prevent the bottle being surreptitiously opened. It consists essentially of a cap adapted to fit and enclose the bottle stopper arms extending downwardly upon each side from the cap and movably pivoted thereto, a jointed rim fixed to the lower end of the arms adapted to close around the neck of the bottle below the enlargement at the top, this rim being made of segmental plates having such radial diameter as to make them rigid in that direction, and with this a means for adjusting the rim to fit any sized bottle neck and means for locking it when it is so adjusted.

Books Received.

"*De Pontibus, a Pocketbook for Bridge Engineers,*" 400 pp. octavo, morocco, J. A. L. Waddell: A technical treatise on the principles of bridge construction and their successful application. Useful to everyone likely to be in any way connected with bridge building. There is no theory in the book; practical information and valuable experience are supplied. The chapter on "Inspection of Materials and Workmanship" is alone worth the price of the book, $3. Jno. Wiley & Sons, New York City.

"*The Language of Light; or, The Mirror of Truth,*" 260 pp. quarto, Terrence Duffy, San Francisco; price, $2: A farrago of rubbish, whose only redeeming point is clearness of type and good mechanical production, affording a job to some deserving printer.

"*The Chlorination Process,*" by E. B. Wilson, E. M., 8vo., 125 pp. Jno. Wiley & Sons, New York, $1.50: This book discusses a process that was first made commercially successful in California, and which has been exhaustively treated in these columns. Scant acknowledgment is made regarding the source of information, the omission being most noticeable from the fact that the mining world universally recognizes what California miners and this paper have done in this specialty. The book adds little to the stock of information on the subject, but, as a compilation, is in convenient form.

"*Lubricants, Oils and Greases,*" 8vo., 54 pp., I. I. Redwood; published by Spon & Chamberlain, 12 Cortlandt St., New York City; $1.50: A treatise intended to furnish engineers and others with information regarding the composition of lubricants in general, entering largely into the chemistry of the subject. The book is of probable value to the manufacturer of lubricants.

Commercial Paragraphs.

THE Baker Iron Works are building for James, Osgood & Kellam a 3-stamp (850 pounds) gold mill, complete, for the Sunnyside mine, in the Chuckawalla district, near Saiton.

AT Sutter Creek, Cal., Knight & Co. are building at their machine shops two 4-foot Knight water wheels and appurtenances for an improvement company at Bakersfield and an air receiver for the Argonaut mine, 44 inches diameter and 24 feet long.

THE Colorado Iron Works Co. are building a set of 54x8-inch high speed, narrow-face rolls for the Anaconda Copper Co., Anaconda, Mont. The Old Jordan & Galena M. Co., Salt Lake City, Utah, have placed an order with the Colorado Iron Works Co. for machinery for a dry crushing plant, consisting of 42-inch taper cast-iron dryer, rolls, ore breakers, feeders, etc.

THE *Two Republics* of the City of Mexico says: "The Central y Anexas Mining Co. of Zacatecas has just closed a contract with Geo. E. Ames, Jr., representing the Union Iron Works of San Francisco, for machinery which will double their mill capacity at Zacatecas. The contract amounts to something over $20,000. The Union Iron Works made the installation of the first plant used by the Anexas y Cia, whose mining property is among the most promising in the Zacatecas belt, and this is substantiated by the present increase of their already extensive plant. The Union Iron Works are doing their share in selling mining machinery in this country, and it is understood they have already furnished a large pumping plant for use in Merida, Yucatan."

IT is often convenient to make an article of cast iron that needs to be finished, and which should be very hard. Cast iron can be hardened as easily as steel, and to such a degree of hardness that a file will not touch it. Take a half pint of vitriol, one peck of common salt, half a pound of saltpetre, two pounds of alum, a quarter of a pound of prussiate potash, and a quarter of a pound of cyanide potash; dissolve in ten gallons of water. Be sure that all the articles are dissolved. Heat the iron to a cherry red and dip it in the solution. If the article needs to be very hard, heat and dip the second, and even the third, time.

Electricity in Mining Operations.

In the February issue of the *Engineering Journal* of Stanford University, Cal., Prof. F. A. C. Perrine, in an article with the above caption, says:

It is popular to say that we do not know the nature of electricity, and therefore it is equally popular to use the name Electricity as a conjuring word, assuming that its introduction into any particular system of operations would necessarily facilitate and cheapen them. Although it is true that we may now give a scientific definition for electricity as well as we can give a definition of light and heat, and a great deal better than we can define gravitation, we are not required to use an exact scientific definition in its engineering application. A sufficiently correct definition may be made by saying that electricity is a means of transmitting and utilizing energy without reference to the form in which the energy is to be employed. This definition includes the points of usefulness of electricity in engineering operations and excludes every other means of transmitting energy. Electricity has often been spoken of as a belt, but no belt can transmit and directly transform energy derived from the pulley of a steam engine into light, heat or motive power, as may be done by the use of this agency; and since it is thus readily transmitted to be used in all manner of energy transformations, it is capable of becoming the willing servant of the miner, as it has been successful in its application to other engineering operations.

In mining it has actually been successfully employed in milling, hoisting, haulage, pumping, drilling, lighting and in effecting electrolytic decomposition. Yet, while these operations include almost the entire field of the miner, there is no doubt that the general introduction of this means of transmitting and utilizing power shows a decided tendency to lag behind other forms of development in mining operations along the Pacific coast. For this there are undoubtedly two distinct reasons. In the first place, the machinery already developed has not been constructed with a view to the special conditions we find here; and, in the second place, the mining engineers and superintendents within this region have not obtained the special training that would enable them to adopt the machinery already constructed and adapt it to their special needs, or to develop new types of electrically-operated machines to serve the particular problems we have here to face. In a sense the lack of technical electrical training on the part of the mining engineers and superintendents who are operating our mines includes the first reason given for its tardy introduction in this field, since we should naturally expect the necessary machinery improvements to come from those most familiar with the particular conditions, and we may not, therefore, expect to see the best use made of this source of power transmission and development until those in charge of our mines have taken the pains to render themselves completely familiar with this branch of engineering. Even were suitable machinery available to-day, these mining engineers and superintendents are not yet sure of themselves when left alone with the electrical machinery after the installing mechanic has returned to his factory, and, until they are sure of their ability to do whatever repair work may from time to time be necessary, it will not be wise for them to attempt its use. A majority of the repairs must always be made on the ground, and quickly, or the introduction of electrical machinery will have the effect of stopping all workings and flooding the mines while an expert is being sent from the nearest manufactory. Also such lack of training will generally bring about unnecessary break-downs from the development of little faults which the mechanic, untrained in this specialty, can never hope to foresee, since that which goes wrong in an electrical machine does not manifest itself to the eye or ear, or even to the hand, until it has reached disastrous proportions. The trained mechanic with his instruments can detect defects and repair them before they amount to break-downs. This training is something which the mining engineer must acquire, or his place will be taken by a new class of mining engineers, who can make use of this agency, for the many transmission plants now being developed in the mining regions will compel the introduction of electrical machinery as fast as the present contracts for water power shall expire and the cost of wood for steaming becomes excessive.

Again, as has been said, this new race of mining engineers will find before them many of the particular problems connected with the introduction of electricity into our mines entirely unsolved. The principal uses of electricity in mining operations at the present day are to be found in coal mines in the East, where the problems are altogether different from those met in gold and silver mining in either quartz or soft rock.

Perhaps the largest amount of power now used in these mines is absorbed in drilling, and while the electrical diamond drill is a successful machine, this drill cannot take the place of the pneumatic percussion drill, nor in this class of work can we make use of the coal auger or the under-cutting chain machine, so effective in coal mining operations. The electric percussion drill is to-day a failure in underground workings. Much surface quarrying has been satisfactorily done by its aid, but its great weight and the high temperature it attains place it at a serious disadvantage when compared with the pneumatic drill. Many times this problem has been attacked with great energy and much money fruitlessly spent in an attempt to develop a satisfactory percussion drill, with the sole result of proving that an electrical machine cannot be directly applied to this service. Whether there is or is not an indirect method of making use of electricity in drilling operations remains for inventive genius to show us.

But even in simpler needs than this of the percussion drill, it is evident that much engineering genius must be brought to bear on the problems before we can hope to see this form of energy successfully utilized. The best and cheapest wire cable to be used under the conditions here found is yet to be developed, and yet there is no need for any particular display of inventive ability. There is a necessity only for an engineering study of the particular conditions which are not at all those familiar to the manufacturers who are engaged in cable making. They are prepared to furnish cables for the underground transmission of electrical energy, heavily insulated with rubber or other compound, and protected by lead piping; but these heavy cables are difficult to maintain down vertical shafts, the lead being attacked by acidulated water and by the organic acids formed in the mine timbering. The manufacturers do not and cannot realize the immense importance of special construction for this field, although the information they now have at hand would enable them to construct a satisfactory cable for the engineer who is thoroughly familiar with the conditions under which the cable is to operate, and who has at the same time some knowledge of the materials available for their manufacture.

In the matter of pumping there is not a great difference between coal mining operations and those in gold, silver and copper mines, and, in consequence, there are to-day electrical pumps that can be used satisfactorily for either sinking or as station pumps —more satisfactorily and more economically than is possible by any system involving the transmission of steam. These pumps are not more economical than those operated by compressed air where reheaters are employed, but, as is well known, the reheater is not always unobjectionable, and the electric pump has many advantages, even when compared with the use of the compressed-air motors in similar service.

Electricity for haulage is also well developed, but as the haulage in the mines we are considering is of no very great importance, this advantage of the application of electricity does not carry much weight.

In spite of the fact that we know the electric elevator to be a safe piece of machinery when used under the conditions met within an office building or manufactory, the application of the electric motor to hoisting, when the power is derived at a long distance from one of the established transmission plants, is not entirely successful. These transmission plants deliver current at a high potential over a multiphase line, and, although the induction motor is a good machine for steady power, it cannot yet be considered thoroughly satisfactory where it is called on to start and stop frequently and to run at variable speeds. This problem also demands considerable study on the part of the mining engineers, although it is a problem which the engineer may solve without attempting to become an inventor—since it is possible to transform the multiphase alternating current to a direct current by means of a rotary converter. This machine has been used satisfactorily in hoisting plants by applying to the hoisting gear a direct current motor, which may be controlled by means of a rheostat, or even operated in two parts and controlled by means of the series-parallel controller. At the same time, not every series-parallel controller is available for this use, since a difficulty is met, as the connection is changed from series to parallel and conversely. At that moment the motors must either be short-circuited or thrown on open circuit, and, although this presents no difficulty in surface traction, where the cars maintain their speed on account of their momentum, opening the circuit of the motor, while hoisting or lowering a car might cause an accident if the car was moving at a low speed without sufficient momentum for it to continue its travel during the time the change was being made in the connections. We thus see that the problem is one requiring a knowledge of the machinery to be employed as well as of the conditions under which it is to operate, which knowledge is only to be possessed by an engineer familiar both with practical mining and with electrical machinery.

Perhaps the most important application of electricity to mining at the present day consists of its use in electrolytic operations, and yet for these purposes we have as yet solved only the simplest problems, involving the disposition of a single metal, such as copper, from soluble anodes, and the recovery of other metals, such as gold and silver, from the slime remaining at the bottom of the electrolytic tanks. On the Pacific coast this method of operation is far less important than the recovery of metal from leached liquors, could this latter operation be satisfactorily developed. Up to the present time it had not been attacked by any one thoroughly familiar with all the conditions of the problem, whereas its solution would yield a rich harvest in the recovery of pure copper, in place of thousands of tons of copper now reduced by the cementation process.

This hasty review of the present condition of the improvements to be hoped for emphasizes a great need for training along the lines of the application of electricity to the particular problems of mining under the conditions as we find them. The solution of these problems is not merely something to be hoped for and something which may casually come in the future, but they are problems whose solution the present state of mining definitely demands, in view of the future expiration of water leases and the intense competition in mining, which will demand the employment of electricity furnished by the long-distance power transmission soon to be thickly scattered over the entire State.

Chlorination Tailings.

However carefully the ore may be treated, a certain portion of gold remains in the tailings, varying, other things being equal, according to the character of the ore. In case this results, in part, from the presence of particles too large to be entirely dissolved, that portion can be extracted by re-treatment, either with gas, by chlorine water, or by amalgamation. But a portion, which is sometimes quite considerable, still remains, and resists every mode of chlorination or amalgamation, and can only be extracted by smelting with lead.

In general it may be said that gold which can be seen by the aid of a lens, after finely grinding, and carefully washing, a sample of the tailings, can be extracted by chlorination, or amalgamation; but that which cannot thus be rendered visible can neither be chlorinated nor amalgamated, even if the ore be re-roasted, with or without regrinding. (If reground it forms a pasty mass which cannot be leached, being almost impervious to water.) Of course that ore is supposed to be properly roasted in the first instance.

Concentrated sulphides containing gold, and free from lead, will frequently yield as much as 98 per cent of the fire assay, if moderately rich, but the extraction of 95 per cent is considered a good result, from ore containing $100 worth of gold in a ton. As the material loses about 24 per cent of its weight in the roasting and leaching, it will readily be preceived that, if there has been no sensible loss of gold in the roasting, the tailings from such ore will assay about $6 per ton, and for every hundred tons of ore treated there will be 76 tons of tailings, containing $456 worth of gold.

Tailings of this character, consisting chiefly of iron peroxide, make an excellent flux for the smelting of galena. All the precious metal they contain is extracted, together with the lead set free from the galena by the action of the iron oxide, and may be considered as clear profit to the smelter, who is obliged to use some kind of iron flux, and can find nothing, unless it be metallic iron, better adapted to his purpose than these tailings.

Gasoline Engines in Mines.

At a recent meeting of Ohio engineers the use of gasoline engines to operate mining machinery was discussed. Heretofore the use of the gas engine or machine which emitted a blaze was considered dangerous in a mine, but it seems now that all scruples in this direction may be overcome.

W. Michel, chairman of a committee appointed some time ago, submitted the report of his committee. He said that gasoline engines had been applied to coal mining in but few cases, and in those had proved successful. Their adoption, however, had been rather slow. He attributed this fact to the unfamiliarity of the operators with the machine and the manufacturers with the needs of the operators. He considered the gasoline engine a great rival of steam, air and electricity in mining operations.

"For example," he says, "you wish to run a fan pump located one mile from the power plant. To conduct steam to this point would be out of the question, as the condensation would be great; with compressed air the friction would be enormous; with electricity, while the loss by resistance and leakage would be comparatively small, the motor would require constant watching. Not so with a gasoline engine; when once started it takes care of itself, using its fuel in proportion to the load carried, about all the attention required being to start, stop and oil it. No mechanical skill is required of the person in charge, a few simple instructions being sufficient to enable any one of average intelligence to manipulate it."

Mr. Michel thinks the idea of danger is all imaginary. He suggests that an external flame be never used, especially in a mine subject to gas, but says a good electric igniter, in which the flame is confined in the interior of the cylinder, is perfectly safe.

Mining Summary.

CALIFORNIA.

Amador.

On the 25th ult., in London, was held a meeting of the Jackson Exploration & Development Co., Limited. The chairman, in moving the adoption of the report and accounts, said that at the incorporation of the company the depth of the Amador Queen No 1 shaft was 292 feet 6 inches, and on Oct. 31, '97, Mr. Dye, the Gen. Mgr., commenced sinking again and from that date to the 5th inst. the shaft had been sunk 570 feet 6 inches, making a total depth of 863 feet. A telegram just to hand announced the sinking of an additional 31 feet, making a total depth of 894 feet. When he last addressed the shareholders the directors anticipated that a depth of 1000 feet would be reached by the end of last month, but, from various unavoidable causes, their expectations had not been fulfilled. No time, however, had been lost in following the advice of the company's consulting engineer, John Ross Jr., and of J. F Parks, viz: to sink to a depth of at least 1000 feet, at which level there was every probability of their finding good bodies of pay ore. The indications of the presence of gold in the Amador Queen mine were of a very promising character. Innumerable assays had been made, resulting in a trace of gold up to over $10 per ton, the majority showing from $2 to $4 per ton. As recently as last month a seam of white quartz, 6 inches wide, was struck immediately next to the foot wall in the south drift, No. 1, 500-foot level, assaying free gold from $2 10 to $3 72 per ton, and giving by fire tests $6 20 and $10 33, respectively. The quartz, after widening to 2½ feet, pinched out on Jan. 16th. This body of quartz was 30 feet long. A week later another 5 feet of quartz, 12 inches wide, was passed through, which assayed by fire test $10.33 per ton. On Jan. 22nd the quartz in the shaft at a depth of 843 feet was 2 feet wide and widening from the hanging wall in sinking. Mr. Ross' opinion was that this quartz would widen out and most likely make pay ore. The first two assays gave traces of gold, the third assay showed 5 cents per ton, the fourth 10 cents, the fifth 19 cents, and the sixth 26 cents, and in the last week in January the quartz assayed 43 cents per ton. A letter had since been received stating that the quartz continued, and was slowly improving in quality with depth, the assays on Feb 9th being in the south end 80 cents and in the north end 75 cents, and all over the shaft 77 cents That sample was taken from a depth of 869 feet. Hitherto they had not been so fortunate as to strike a body of pay ore of sufficient magnitude to set the mill constantly at work and contribute towards the cost of sinking the shaft, but such an event might happen at any moment. There could be no doubt that there was payable ore in the mine, and they only had to go deep enough to get it. They were surrounded by well-known and paying mines. The motion was carried.

Work on the Gritton gravel mine, near Volcano, is pushed day and night. One shift is driving the main tunnel ahead, while the other is making an upraise to tap the channel.

Work on the Blue Jay mine has suspended temporarily.

At the Potazuba mine on the 500 level the crosscut is progressing at the rate of 3 feet a day.

The Kennedy is crosscutting from the 2150-foot level of the north shaft.

The shaft at the Amelia has reached a depth of 450 feet.

The *Republican* says that an 8-foot ledge of milling ore was found in the 500-foot level of the Anita mine.

The South Eureka, says the Amador *Republican*, is paying from $2000 to $5000 monthly above expenses.

At the Central Eureka crosscutting is being done on the 500 and 800-foot levels. The *Republican* says that prospects there are encouraging and that a mill will be running on this property before the end of the year.

The January output at the Wildman-Mahoney is said to have been over $38,000.

Republican: The Oneida has reached 1534 feet depth. A crosscut will be run for the ledge. The company contemplates erecting a mill as soon as the property is opened up.

Butte.

Mercury: Near Big Bend J. A. Clark is working an old river bed and is reported to have good ground.

Thirty acres of mining land have been located by residents of Cherokee. The fact that this land was vacant is a recent discovery.

At the Big Betsy mine near Enterprise development work is progressing.

C. H. Schievely of Oroville and J. M. McClung, upon consideration of erecting a mill and hoisting works immediately, were deeded a one-half interest in the Sunnyside mine at Robinson Mills, near Forbestown. The mine has a shaft 65 feet deep, from which the owners have taken out about $3000, crushing the rock with an arrastra. The ore body is about 1 foot wide.

Calaveras.

(Special Correspondence).—The Petticoat mine near Railroad Flat is being thoroughly prospected. It has a shaft 450 feet on a 9-foot ledge. There are three chutes from 5 to 9 feet of a medium grade. If the property after further development warrants, a 10-stamp mill will be erected. Steam is used for motive power. W. H. Cleary, Jr., is Supt.

Railroad Flat, March 6th, '98.

At the Ghost mine sinking goes on.

Work has been suspended temporarily on the Gold Hill mine at Smith's Flat.

At the Curtis Con. the ore body is extensive and bears a high grade of sulphurets.

The Great Western is turning out good ore.

The *Echo* says that a good body of ore has been struck in the Zeigler Con., carrying free gold and sulphurets of a high grade.

At the Tracy mine the ore prospects satisfactorily.

The Harris mine intends putting up machinery and opening up the mine in first class shape. Some good rock has been taken out.

Work is going on steadily at the Keystone, near Altaville. The ore prospects well, and the ore body is extensive.

The Blair mine on Smith's Flat is sinking a 1000-foot shaft to reach the chutes of ore which are believed to lie at that depth.

The Keltz mine, near West Point, is producing good ore on the 400-foot level.

The Page Cutting, in the Sheep Ranch district, commenced piping last week.

Bush & Pache commenced piping last week on the Ide & Tewelliger hydraulic claim on San Antone range.

D. Fricot has let a contract to run a tunnel across O'Neil creek.

Doe & Jackson made a cleanup of $700 in the Shady Side, near Railroad Flat. Development shows a vein 10 feet in width.

El Dorado.

The Placerville *Nugget* says the Grizzly Flat gravel mine and 10-stamp mill have closed down for an indefinite time.

Democrat: The miners at Fairplay are making good use of the long-looked-for rain by running the gravel that has accumulated at their tunnels.

Humphries Bros. have struck good pay gravel.

Good pay has been found in the Hughes claim at Fairplay. As much as $5 has been taken out to the pan.

J. Mott made two good clean-ups this winter.

Twenty-five men are at work in the French Hill mine, six miles north of Greenwood, with good results. The sulphurets are sent to San Francisco.

Development has begun on the Grossman mine near Green Valley.

Nugget: L. Ferretto, near French Ravine, has struck good pay gravel.

Snow Bros. at Newtown have started another hydraulic mine.

Tacchino & Gardella have reopened the Iowa Gulch gravel mine.

DeLeat & Ricci are working the old Wolf seam diggings in Greenwood township.

Supt. Moss will resume operations at the Hines mine.

Sands Bros. are working the Eliza Ravine mine, Greenwood township.

A recent assay of ore from the Chittenden mine, Greenwood township, shows $6.30.

The Twin mine at Green Valley, a new prospect, yielded $142 from ten tons. The shaft is down 65 feet, showing a well-defined ledge of 14 inches.

Inyo.

In the Argus range the Inyo Con. M. Co. has within the last month gone down 50 feet on its 21-foot ledge in the Belanciana mine, and is crosscutting. The company has 200 tons of ore on the dump, which is improving with depth.

Kern.

Near the summit of the Panamint range, 8000 feet high, is the Cooper mine, said to have a rich vein of ore from 2 to 3 inches thick, showing gold all through. Sixty-three sacks milled at Ballarat yielded $10 per sack.

On the Comet and Starr, between Rand and Panamint, a shaft has been sunk 90 feet, following the ledge. Considerable ore is on the dump, assaying from $8.50 to $126 per ton. The ore is stained with copper and contains some silver.

An average of 2000 tons of ore is crushed by the mills of Garlock each month, producing between $45,000 and $50,000.

Miner: The Randsburg Railway Co. is delivering water in carload lots of 6000 gallons at $20 per car at the depot in Johannesburg.

Rand: The St. Elmo mine has seventeen men at work and has shipped 115 tons of ore since February 15th.

Madera.

(Special Correspondence).—The bar at the junction of Fine Gold and Crystal Falls creeks, near Central station, has been bonded for thirty days to McKensie & Fletcher of Fresno for $2500. A thorough prospect of the ground will be made, and, if the result justifies it, a 300-foot race will be cut which will drain the bar to bedrock.

A ton of average rock has been sent to the smelter from the Starbuck mine to test the percentage and value of the sulphurets. If the returns are satisfactory, a concentrator will be added to the mill. M. Williams is Supt.

A San Francisco man has concluded an examination of the Magnet lode near Central station. He reports the vein to be a true fissure contact between a composite Genesee granite on the hanging-wall and stratified porphyritic granite and talcose slate on the footwall. He found the vein regular throughout the length of eight locations with a width of 3 to 5 feet of quartz, which carried at all points, where opened, free gold and sulphurets in paying quantities. The discovery of tellurides at several points on this lode has created interest in this locality. Prospecting upon the lode is being actively pushed.

Gold, March 7th, '98.

Mariposa.

(Special Correspondence).—Doty, Pascoe & Ten Eyck, who recently leased the Louisiana mine, have started up the mill again and are well satisfied with results thus far.

The Red Banks and Crown Lead properties, which were closed down entirely a few weeks since, are to be started again about March 10th with twenty men. It is reported that the properties have been taken over by the London interests which have held the bonds on them for the past year.

The Virginia mill is running and with satisfactory results.

Hilliard & Hedges expect to have the Compromise mill running about March 15th, adding another to Mariposa's bullion producers. A new and very promising vein has been opened, showing 4 feet of quartz carrying some $10 in free gold and about 5 per cent of sulphurets. The 10-stamp mill has been overhauled and is about ready to start. The mine has a long record as a producer of high-grade ore in the past, but has been idle for fifteen years. The first mill on this property is generally conceded to have been the first stamp mill in California.

Negotiations are pending for the reopening of the old Hasloe mine on Gentry's gulch. The mine at one time was considered one of the richest in the State, but has been idle for more than ten years.

Mariposa, March 8th, '98.

Mono.

(Special Correspondence) —There are but 8 inches of snow in this locality, and water will consequently be scarce Because of present water famine and freezing weather, the Jackson & Lakeview Co.'s mill has been temporarily closed. Dead work, that has long been a necessity, is being done in the meantime. The company, during its many years of operations, has never experienced such a dearth of water as now exists.

The Standard has hung up its stamps temporarily, but is using steam for hoisting.

Lundy, March 6th, '98.

Nevada.

(Special Correspondence).—Almost a year ago San Francisco parties took up the old Diamond mine, within a mile of Grass Valley, a property abandoned years ago. The company cleaned and retimbered the old shaft, erected necessary buildings and vigorously pushed development. The company has in a measure been encouraged by the finding of an ore body that promises well in size and quality. Assays show a high grade of ore. The company contemplate building a 5-stamp mill at once. The president of the company is A. C. Widber, city and county treasurer of San Francisco.

Grass Valley, March 8th, '98.

(Special Correspondence).—The Mayflower mine near this city, owned by W. H. Martin, was bonded recently to P. Etchebarm of San Francisco for $120,000.

The property has extensive underground work and is provided with a 20-stamp mill and other machinery.

Nevada City, March 7th, '98.

On the Tom Boy and Hitchcock mines near Round mountain a new ledge was discovered which is of good size and shows some free gold.

The Kentuck mine near Grass Valley has suspended operations temporarily.

The *Union* says that work will be begun on the Normandie mine, near Grass Valley, and also states that the Golden Gate mine, near Grass Valley, will begin development work at once.

P. Curnow has struck a ledge in his mine near Columbia Hill, the extent of which has not been determined. A drift has been run 27 feet in the quartz and there is no indication of a foot wall. The ore yields a fair prospect.

The unwatering of the Phœnix mine has been completed, and the task of cleaning up the drifts, winzes, etc., is well started.

Placer.

(Special Correspondence).—Work will be resumed on the Lost Emigrant mine, sixteen miles south of Summit, so soon as the snow disappears. The property is owned principally by F. L. Heath, E. Doolittle and S. W. Jacobs of Summit. A shaft has been sunk 75 feet on a ledge varying from 18 inches to 8 feet. Mill tests have yielded as high as $75 per ton. The company will build a 5-stamp mill.

Summit, March 5th, '98.

The Eureka gravel mine near Forest Hill during February, with two shifts, ran 223 feet of bedrock tunnel. The tunnel is in 2455 feet.

The last clean-up at the Bellevue, Ophir, twelve tons, was 149 ounces of bullion.

Plumas.

Operations are active at the Plumas Imperial.

Eaton & Wilson have driven a tunnel on bedrock 107 feet through a deposit of gravel at Rich Bar that prospects fairly well, the deposit varying in depth from 1 to 6 feet.

The Claybank Co. is running the main tunnel at a rapid rate.

Riverside.

Near Perris there are five mills in operation—the Good Hope, 20 stamps; Virginia Queen, 5 stamps; Santa Rosa, 20 stamps; Riverside G. Co., 10 stamps; Santa Fe, 5 stamps.

San Diego.

The Signal Hill group of twenty-six claims will be further developed. Shafts have been sunk and drifts run to determine that the deposits of ore are large, though probably low grade.

Shasta.

T. F. McAvoy secured an option on the Lyons mine on Rich gulch for Chicago capitalists.

Sierra.

The Rising Sun mine is about to start up.

The Sierra Buttes has closed temporarily to replace machinery.

The Downieville *Messenger* says that the insurance Co. will build a new mill and replace the buildings destroyed by fire at the Young America mine last summer.

Dr. King of Salt Lake and E Lewis, interested in a quartz property near Downieville, contemplate putting a mill on the property.

The Mexican is making a test crushing at the Gold Bluff mill.

The Grass Valley *Union* states that the Plumbago mine is in rich rock again and in a few days $16,000 was taken out. One piece, which weighs less than 100 pounds, is estimated at $10,000. The mine is owned by the Crœsus G. M. Co. of New York. It was bought three years ago and since that time nearly $300,000 has been extracted, mostly from specimen ore.

Siskiyou.

The Salt Lake *Tribune* says that E. H. Alris of the Mercur M. Co. returned from California, and quotes him saying it was impossible to overlook the fact that greater interest is being taken in the mining camps of California than at any time since the boom of early days. With Mr. Dern and others he has interested himself in Siskiyou county.

The Ætna *Ideamer* says that ninety-five tons of ore at the Ball mine yielded $15 per ton.

Journal: While the dry season has made gulch and placer mining an impossibility in many localities, the river mines have had an uninterrupted season. On the Klamath the Buckeye Bar placer mine has been worked during the past winter, something they have been unable to do when the water was plentiful.

C Jensen is working his hydraulic mine on McKinney creek, and will soon be ready to make a clean-up C. Parker & Co., farther down the creek, have their hydraulic plant started. At the mouth of McKinney creek Jackson & Crary are working upon pay gravel.

The Distlehorst & Barton dredger, in operation on the Klamath river, near Oak Bar, is taking out pay gravel.

J. Pedibodou sold a claim at Scott Bar for $4000.

News: P. C. Lang & Bro. have started their hydraulic on Barkhouse.

Osmond, Phelps & Co have started drifting near Oak Bar, owing to the water supply being insufficient to operate their hydraulic plant.

H. J. Barton is building a dam on an island of the Klamath at Oak Bar, which will drain the river bed, 1200 feet long by 150 feet wide.

Work has begun on the Jubilee mine at Humbug by a San Francisco company. W. F. Shurtliff is Supt.

Trinity.

Eighteen tons of high grade ore at the Lappin mine, near Deadwood, are ready for shipment. Ore of a free gold character is run through an arrastra. A tunnel is being driven to catch the veins at depth.

On the Gruss and Turner mine development work is being done and the property is assuming the appearance of a mine

At the Willey mines considerable good ore is on the dumps.

Zent & Thorne are taking out fair rock from their workings. By arrastra it yields about $10 per ton.

The *Journal* says that a company is being organized at Trinity Center with a capital of $250,000 to work the channel of the Trinity river, for a distance of ten miles, by P. McDonald, P. Holland, Bragdon Bros., Moore & Withem.

Phillips & Nordose have a placer claim near Trinity Center, and will soon have the latest improved machine at work.

The strike at the La Grange mine has been declared off. Unable to induce the employes of the mine at Junction City to join in the strike, the fight has been abandoned.

Redding *Searchlight*: Ruggles & Peterson, above Trinity Center, have struck a good ledge of $14 rock. The Bloss & McClary hydraulic, under the new ownership, is running day and night.

Crowe Bros. are making a good run on their placers and also have a crew at work on a quartz property.

Maynard & Demock have discovered a ledge of gold and copper bearing rock on Copper creek. The ledge is 35 feet wide.

W. Vollmers has made a good ore discovery on Squirrel gulch near Trinity Center.

Tuolumne.

(Special Correspondence).—Work on the Bell mine, which is a new prospect, is being prosecuted vigorously and with very satisfactory results. The shaft has reached 350 feet. Crosscutting is being done on the 300 level. The ore value runs high, more so than the owners at present care to disclose. The work is carried on by San Francisco bankers and Geo. Blake, who is also Supt. The mine will be among the steady producers of Tuolumne county. A mill will no doubt soon be erected.

Tuttletown, March 7th, '98.

J. P. E. Heintz of San Francisco has bought the Eberhardt property, near Jamestown.

At the old Oakland mine W. Butterfield is getting the 5-stamp mill ready for starting.

The Sonora *Democrat* says that J. T. Newcomer has struck a good vein on the Snell group at American Camp.

The 10-stamp mill at the Arbona started last week.

The Dead Horse has struck good ore below the 1400-foot level.

The tunnel at the La Estrella is in 250 feet.

In the U. S. Circuit Court Judge Colt, in the case of G. M. Pinney vs. Wm. A. Nevills et al, dismissed the case and discharged the trustee on account of lack of jurisdiction. This is the suit brought against Nevills et al, officers of the Rawhide G. M. Co. The plaintiff acted as agent for the company in Boston, and alleged that he was authorized to dispose of its entire capital stock. Chas. W Norton agreed to purchase the stock at $15 per share, for which plaintiff's commission was to be $75,000 The company refused to allow the sale, and it was sued for $100,000 on an action of contract. The stock had been deposited in the National Bank of the Republic, and it was then attached by the plaintiff The defendants requested a transfer to the U. S. Circuit Court. Afterwards they asked dismissal of the case on the ground that property of a foreign corporation, owned by non-residents, could not be attached. The bank also asked to be discharged as trustee. Both motions were allowed.

Yuba.

Transcript: The operations of the U. S.

Debris Commission at Smartsville have been abandoned until the water gets lower.

The Marysville *Appeal* says the Webb M. Co. have added thirty men to their force at Browns Valley, and will sink the shaft on the Pennsylvania 400 feet deeper.

NEVADA.

The lower tunnel of the Corieux mine, near Mountain City, has cut the ledge, and an upraise has been started to connect with the upper workings for air.

The Bray and Bell mines at Ione, Nye county, owned by the Ione M. Co., are said to have been sold to the Nevada M. Co. for $150,000. The Nevada M. Co. has been operating at Austin for some years, and it owns the Nevada Central Railway, which runs from Battle Mountain to Austin. Sheriff Easton of Lander county says there are more men in the Ione mines than there were in Nye county two years ago.

At the Summit mine, near Pioche, enough ore is blocked out to keep the mill running for the next ten months at its present capacity, which is about thirty-five tons per day. The mill and mine employ forty men.

The April Fool mine, at De Lamar, is putting through twenty tons of ore daily of an average value of $25 gold per ton.

The Ione M. Co., at Ione, is employing 100 men and milling the gold values out of forty tons a day. The shaft has a depth of 300 feet.

The Nelson M. Co. is sacking good ore from the Charley Ross mine.

Work was begun on the Zirn placer mine, near Genoa. The dirt will be hauled a mile to be washed.

Parsons & Davis at Silver City, says the Dayton *Times*, will put in a crushing plant to handle from forty to fifty tons of ore per day. There is considerable low grade ore on the dumps of the Silver City mines.

The Salmon M & S. Co. shipped two tons of copper bullion.

OREGON.

(Special Correspondence).—Referring to an item that appeared in last week's issue of the MINING AND SCIENTIFIC PRESS concerning a group of properties near Cornucopia, I am enabled to give you some particulars of the transaction, which is of some magnitude. The extensive development to be carried out on the various claims and the subsequent placing of a large machinery plant will add considerably to mining interests in general and to this section particularly.

The purchase, under a bond, was made by A. B. Bement of Terre Haute, Indiana, who has given much time to thorough investigation of the locality. The properties are the Red Boy and extension and the Mountain Chief and extension, for $16,000; Queen of the West and three extensions, $16,000; May Queen, $4000; Omaha, $4000; Allen, $6000; Poorman, $8000; White Elephant and Jumbo, $10,000.

Upon this price a payment of 10 per cent is to be made Nov. 1st, '98. A 10-stamp mill is to be erected at once for prospecting purposes. Mr. Bement is expected to return shortly from the East and will, I am informed, take personal charge of the general management.

Baker City, March 8th, '98.

The Baker City *Democrat* says that the Bonanza M. Co. will add a mill of 100 stamps to the present 20-stamp mill, which will be moved to Bennett creek.

Keith & Bamberger will build a mill on La Bellevue mine at once.

The Baker City *Democrat* says that capitalists of Hanover, Pennsylvania, purchased the Denny group, sixteen miles from Baker City, and have begun extensive development work. D. W. Nelson is Supt.

The Baker City *Democrat* reports the clean-up at the Red Boy for last month to be $10,000.

In Baker City, a one-half interest in the Gordon Con. placer claim on Gimlet creek was transferred to D. C. Miller. The property is equipped with a good hydraulic plant. Last year a nugget weighing $493 was taken from this ground. Operations will be carried on night and day while the season lasts.

The Helena mine at Seven Devils has ceased operations for a short time.

Riggs & Bacon have discovered a vein of quartz near Woodville, 18 inches wide, which prospects well in free gold.

The Jewell Hardware Co. of Grants Pass bought during February gold dust to the amount of $7404.

Jones & Co. near Grants Pass struck a ledge which shows 18 inches of good ore.

Good ore is being taken out of the Big Mountain mine at Missouri Flat. The ore carries gold, lead, iron and silver.

The Rock Gulch hydraulic mine at Galice creek produced $600 in five days run.

The ledge at the Columbia mine near Baker City has been crosscut and ore exposed, which is satisfactory to the management.

The Baker City *Republican* says that I. Guker at Canyon City took a nugget out of his claim last week that weighed $790.

Development in the Ashland & Mattern group is progressing steadily, thirty men being employed.

The width of the ledge in the Peacock mine at Seven Devils is 102 feet and will average 22 per cent copper.

The strike in the E. & E. mine near Baker City is said to be 8 feet of free milling ore at a depth of 500 feet.

J. R. Farrell, for J. E Searles of New York, has applied at the La Grande land office for patents for the Motor and Gore claims near Sparta. Their development will be pushed rapidly.

WASHINGTON.

The Trilby group near Ellensburg has been sold to Philadelphia people for $10,000 cash.

The net return on eleven and a half tons of ore shipped to the smelter by the Gladstone group on Silver creek was $31.20 per ton. The ore ran in lead 66.7 per cent.

The Bonanza mine, four miles from Bossburg, has struck ore that runs from 30 to 40 per cent lead and from ten to fifteen ounces silver. The mine has been operated and shipping more or less for the past seven years. The body of ore is 300 feet long and from 5 to 30 feet in width, with 100 feet of stoping. Supt. Hanley estimates that there is sufficient ore in sight to ship three carloads a day for a year. The company will sink another 100 feet, and put in heavier machinery for the more rapid development of the property.

The Conquest mine, between Usk and Newport, is shipping ore.

Work has begun on the Penciltuck mine, near Box canyon.

Brown & La Claire struck gray copper ore near Usk.

The Columbia Placer M. Co. at Wenatchee is taking out $35 a day.

The Comstock-La Fleur Co. has started ten men to work near Nelson. The company will put in machinery in a short time and work the mine extensively. The ore is copper, said to run 40 per cent besides $60 in gold.

BRITISH COLUMBIA.

The Canadian Pacific railway has contracted with the War Eagle mine for the shipment and treatment of 100 tons of ore daily for one year. The freight and treatment charge is $7.50 per ton, a reduction of $3.50 below the rates which have existed.

P. C. Stoess has taken a bond on the Lone Star and Spotted Horse, near Ymir, for $20,000.

Ferguson & Coldwell of Kaslo have given an English company an option of $7,000 on the Carbonates on Spring creek. It is probable that a concentrator will be built by the purchasing company in the spring.

T. A. Garland, for a Manitoba company, has taken a bond in the sum of $10,000 on the Falcon mine, near Central Camp. Five per cent was paid in cash and the balance is to come in equal installments at six and twelve months.

The Brooklyn mine, in Greenwood Camp, has been bonded by J. E. Boss for $50,000, paying 10 per cent cash and the deferred payments to be made in equal installments every sixty days.

A representative of the Omaha & Grant Smelter Co. denies that his company is about to withdraw from the Kootenay. He says the company still owns the Pilot Bay plant and other mining interests and the suspension of operations is but temporary. It is thought, however, that the resumption of work is contingent upon the action of the Dominion Parliament in raising the import duty on lead products.

On the Rooney and Lucky Jim, near Salmo, there is a 3-foot ledge, furnishing free-milling ore assaying from $3 to $9. Both claims carry gold, silver and copper, averaging $3 in gold, 4 per cent copper and ten ounces in silver.

The Mollie Hughes group, near New Denver, was sold to an English company for $40,000.

John B. Hobson, Mgr. Con. Cariboo hydraulic mine, near Ashcroft, who is in San Francisco, says: "Twenty-one cubic yards of gravel were washed through small sluices charged with quicksilver in the usual way. The gold recovered therefrom after retorting weighed 236 grains, valued at $8 26, making an average of 39 3-10 cents per cubic yard, which, added to the product of samples taken in '96, as follows; from shaft No. 1, 27.6 cents; shaft No. 2, 50.6 cents, '97; from face of bank No. 3, 99 cents; face of bank No. 4, 36.3 cents; making the average of the four tests of gravel of the bottom bench yield 54 1-10 cents per cubic yard.

ALASKA.

The Bald Eagle at Sumdum, consisting of five claims, is working the ore from a depth of 400 feet. Every Alki takes south a large quantity of concentrates.

At the Sumdum Chief the 10-stamp mill is crushing twenty-five tons of ore every day.

At the Belmont group, near Sumdum, work has been pushed all winter. The ledge is 300 feet wide. The ore averages $5 per ton in silver, gold and copper. It is probable that a 40-stamp mill will be erected on this property next summer. There is a mill site and plenty of water for power.

The Don Carlos has been bonded and work will commence in the spring.

The Cumberland, owned by the Alaska G. M. & T. Co., has made arrangements for tunneling, drifting and sinking.

The Illinois, Kentucky & Washington group, near Sumdum, all show up well so far as development work has progressed. They are owned by the North American M. & M. Co.

Across Endicott arm, four miles from Sumdum, is the Portland group. The property is developed by shafts and open cuts and good ore is in sight. The mountain is timbered with yellow cedar.

THE KLONDIKE.

Eleven men from Dawson reached Seattle last Wednesday. They had $40,000 in gold and $100,000 in drafts. They left Dawson Feb. 7th and report the discovery of placer grounds on Walsh creek, a short distance down the Yukon from the Big Salmon river. Prospective Klondikers, who were caught in the ice at the mouth of this river and were compelled to winter there, made the strike. They were compelled to go into winter quarters, and put in the time prospecting the streams in the neighborhood. Nothing of value was found until the new creek was tried. The first dirt panned ran 35 cents to the pan and from that up to 75 cents. Thirty-two men had located claims up to Feb. 21st. These claims are the regulation 100 feet. The creek runs back from the Yukon about twenty miles.

Speaking of the scurvy epidemic at Dawson, one of the returning passengers says: "When we left Dawson there were between twenty and thirty cases of scurvy there. There is no need of anyone at Dawson getting the scurvy. After a few years in the interior country, men get careless as to the variety and preparation of their food. Some of the old Yukoners have been living on little else this winter than bacon, beans and bread. They cook them in a hurry and in very unclean fashion. They don't seem to care for a variety of food. They could get it if they wanted it. The old Yukoners are the chief sufferers. A very few of the new comers are sick. They are full of life and work hard, while the old-timers lie around their cabins and do no more work than enough to keep them in bacon and beans."

In speaking of the food question, he said he had expected to stay in the country all winter and stocked up well with supplies, and when he sold his supply before coming out lost heavily. He bought three sacks of flour in the fall for $800; before leaving he sold two sacks for $90, and had hard work to find a buyer; a case of desiccated potatoes sold for $30—just what he paid for it after the boat arrived in the summer. Canned goods, for which he paid $1.50 a can, went begging at $1. At the stores you can get butter, milk, etc., in small quantities, at summer prices.

The returning Klondikers report the trip up the river a hard one, and all had difficulty getting past Thirty Mile creek. Several were slightly frozen.

A considerable exodus had set in from Dawson to Rosebud creek, about fifty miles above Dawson and four miles from Sixty Mile creek. The story that caused the excitement early in January was that a party prospecting on the Upper Yukon found gold from the start on Rosebud creek. They are said to have taken out dirt that ran from $4 to $10 a pan. The news spread, and already a number of claims have been staked and cabins built on Rosebud.

The Seattle, Wash., *Times* of the 5th inst. makes prominent this announcement: "Out of the number of steamers which have departed from Seattle to northern ports since he 1st of August, '97, five have been wrecked and nearly one hundred lives have gone out because of these disasters."

A recent returner from Skaguay says: "When I left Skaguay between fifteen and twenty had died of spinal meningitis and several others were sick. I did not hear of a single case that recovered. It is invariably fatal and lasts from three to nine days. The disease is infectous but not contagious. There are also several people there suffering from la grippe. The condition of affairs is appalling. The cause of the sickness is due to a stratum of air that comes down from the mountains and meets the mist and milder air that comes out from the gulches. The effect produces a chill, and may be more accurately described by saying that it is like rushing, in about five minutes, from an extreme cold to a milder climate. The Indians will not live in Skaguay in the winter. Many cases reported as being frozen to death died from cerebro spinal meningitis. There are between 3000 and 4000 dead horses lying within a radius of twelve miles of the town, and when warmer weather sets in no one can foretell the disasters that may result from the decomposition of these carcasses. One noticeable feature of the town is the listless condition of the people. They sit around in their cabins and in the hotels and boarding houses without hope or ambition, their state of mind, no doubt, being produced by the sickness now ravaging the town. Yet people will not stay away from there; the prospect of becoming rich draws them, magnet-like, thither. On one day, returning, we passed ten crafts, all crowded with freight and passengers. They are flocking in there in all conceivable kinds of vessels—scows, barges, sailing boats—anything that will transport them to the country. It would be a blessing and a philanthropic act if some one could stop the frantic rush and induce the people to stay away."

IDAHO.

A strike was made last week on the Jackson, six miles above Murray. The lead is 14 feet wide. Five feet of this is galena, the balance being good concentrating ore.

Press dispatches state that the report has become current that the Hunter at Mullan will commence rebuilding its mill at an early date; also that a new flume will be put up and a shaft started.

The Hi-Yu mine in the Florence district passed into control of an Eastern company under a bond of $60,000, payable in sixty days. A cash payment, said to be $10,000, has been made. The ore runs from $10 to $16 a ton in gold. The new company, it is reported, will put more men to work and will increase the capacity of the mill with five or ten more stamps.

C. H. Oliver of New York has bought the Horseshoe placer mine near Lewiston for $80,000.

The Sadie Ann and Eagle claims, about four miles from Warren, have four distinct ledges. The middle ledge of the Sadie A. has a shaft to a depth of 37 feet. At the surface of the ledge there was a pay streak 4 inches wide, which has widened to 16 inches. The pay streak is ribbon quartz. This spring the company will put in a pumping plant. A tunnel is in 92 feet and has struck the ledge at a depth of 175 feet. There are four different pay streaks in the ledge from 2 to 8 inches wide. Jas. Wilson is Supt.

The Rescue, near Warren, has paid its owners $110,000. There is about 3000 feet of work done on the property and the depth attained is 200 feet.

The Goodenough, owned by the Idaho Con. Co., C. Czesic Mgr., has an upraise shaft 275 feet deep, with a 400-foot tunnel. The company in their first run of three weeks from a 5-stamp mill cleaned up $8000.

The Iola, near Warren, owned by the Honest John M. Co., Capt. Moore Mgr., has about 2300 feet of tunnel and drift work.

UTAH.

In the Cannon group at Mercur a strike was made of the ore that shows an average in the breast of the drift of $8 a ton.

The Galena made its first shipment out of Beaver Lake last week and is hoisting ore for another, and putting down the main shaft to greater depth.

At Minersville L. Lessing made a shipment from the Cave mine, from which he derived good results.

The Grand Central at Mammoth is putting out a carload a day, but no attempt is made to crowd shipments.

The Galena of Beaver Lake has been added to the list of producing mines. The vein is from 6 to 18 inches in width.

Tribune: During 1897 the Horn Silver marketed crude ore and concentrates of the value of $244,263.39, paid a dividend of $20,000 and closed with a cash balance in the bank of $136,889.72, in addition to "call loans" amounting to $53,000. The cost of extracting the ores was $4.09 per ton, and the cost of concentration, in which four and a half tons of crude ore were reduced to one ton of concentrates, $1.25, or $5.34 per ton when ready for the market. The average value of concentrates was $20.98, that of the shipping ore $16.70.

The Mayflower group, near Bingham, has driven 100 feet on the vein, and in a crosscut has uncovered an oxide of iron, samples from which show an average of about $9 per ton gold.

The output of the Mammoth mine the past week was 400 tons of high-grade ore and seven carloads of concentrates.

The Grand Central at Mammoth averages an output of thirty-five tons a day, showing an average of 30 per cent lead, 40 ounces silver and $15 in gold.

J. W. Green announces an 8-foot vein in the Pacific shaft at Eureka at a depth of 60 feet, with a 6-inch pay streak showing values of 139 ounces silver, $14 gold and 39 per cent lead.

A new strike is reported in the International mine in west Tintic, showing 30 per cent lead, 2 ounces silver and $1 in gold.

At the Highland Boy, at Bingham, in February, 1500 tons of crude ore were put through the mill, while 950 tons went upon the market. The shipping ore showed a valuation of 11 per cent copper and nearly $5 in gold, the gold values running up at times to as much as $20 per ton.

Mercury: The ore body at the Geyser-Marion, Mercur, has increased to 37 feet between walls. The ore averages from $3.25 to $4.50 per ton and is furnishing thirty-five tons of ore daily.

The Sacramento made its semi-monthly shipment of cyanides last week. The mill is running entirely on oxidized ores.

The second lot of concentrates from the Red Wing, at Bingham, has reached the sampler. The Red Wing is one of the new properties added to Bingham's producers during the year.

The output of the Bullion-Beck for the ten months it was in operation in '97 consisted of 19,932 tons of crude ore, of a valuation of $597,192.04, and 2492 tons of concentrates, of the value of $39,161.85; a total of $636,353.89. The mine is putting out about 1800 tons per month. Since resuming work in December new ore bodies have been encountered.

The last clean-up at the Mercur was $20,000 in gold cyanides.

MONTANA.

The receipts from the sale of bullion and ore in 1897 from the Alice G. & S. M. Co. at Walkerville amounted to $559,474 47; dividends amounting to $60,000 were distributed, and on January 1st the company had a cash balance of $25,116.17. The company has paid total dividends amounting to $1,055,000.

The Culipper in Granite Co. has become the property of the company controlling the Golden Sceptre mine. The mine has been idle many years, due more to litigation and the poverty of its owner than anything else. It is stated that the Golden Sceptre people will at once unwater the property, increase the depth of the shaft to 1000 feet and commence ore extraction.

The mill at the Leiter mine near Leiterville, has resumed crushing.

The Sylvanite *Miner* says that the Keystone will build a tramway to succeed its present mill, perhaps a 60-stamp mill, or even greater if the showing in the new tunnel should warrant it, and a cable line, more concentrators and other improvements which go along with a first-class plant on an extensive scale.

The Goldflint and the Keystone at Sylvanite each shipped a carload of concentrates last week.

Silver ore recently shipped from the Big Bonanza near Walkerville ran as high as 125 ounces to the ton.

At the Gold Coin mine near Georgetown, on the 400 level ore was struck running $60 per ton free. Concentrates average $290 per ton.

The Boston & Montana Co., in its suit against the Montana Ore Purchasing Co. for damages for ore alleged to have been unlawfully extracted from the Pennsylvania claim, filed a motion appealing to the Supreme Court of the U. S. against the decision of Judge Knowles in dismissing the suit for want of jurisdiction. The judge some weeks ago sustained the demurrer of the defendants on the ground that no federal question was involved in the trial of the case. The plaintiffs contended that the determination of the suit involved the construction of a U. S. statute.

The matter of the application of the Colusa-Parrot Co. for an injunction to restrain the Anaconda Co. from working within the vertical side lines of the Colusa-Parrot ground was heard by Judge Knowles in chambers. A temporary injunction is granted, by which the defendants will not be allowed to mine inside the vertical sidelines of the Colusa-Parrot.

The Liberty mine, in Barker, from two cars of ore netted $2129. Atkinson Bros. of Neihart own the property.

The Anaconda *Record* says that fifty-two bars of bullion, aggregating $75,000 in silver and gold, were shipped last week by the Anaconda Copper Co.

The Monte Cristo mine in Sheridan made an

re shipment of three tons, and the returns were $121.50 per ton.

SOUTH DAKOTA.

The Portland Con. M. Co.'s property in the Black Hills was sold by the sheriff for $338,-098.42. The property was bid in by H. W. Seaman, as trustee for the bondholders. This sale is in the nature of a reorganization of the corporation, with a view to operating the property on an extensive scale.

Fire last Thursday morning destroyed the Deadwood & Delaware Smelter and a considerable amount of railroad property at Deadwood. Loss about $150,000.

WYOMING.

Press dispatches state that the Hartnell iron mines will be be worked by L. Voorhees of Cheyenne. This will serve to keep several hundred men in employment.

E. P. Snow sold to C. H. Souther, Pres. of the American Dredging Co. of Massachusetts, 640 acres of ground in Albany county. Mr. Souther will work the property with a dredging machine during the coming season.

MICHIGAN.

The annual report of the Tamarack Co. for 1897 shows gross receipts from sales of copper and interest receipts $2,267,340, total costs $1,835,810. The superintendent's report says: "During the year we hoisted 726,665 tons of rock; 60,179 tons were rejected in rockhouses, and the balance, 611,539, stamped; cost of stamping was 26.418 cents per ton; total cost per ton of rock mined, $1.74; total cost per ton of rock stamped, $2 07; mineral obtained for the year, 29,580,380 lbs. The depths of the several shafts, Dec. 31st, '97, were as follows: No. 1 shaft, 3240 feet; No. 2 shaft, 3775 feet; No. 3 shaft, 4526 feet; No. 4 shaft, 4450 feet; No. 5 shaft, 2015 feet."

ONTARIO.

(Special Correspondence).—The Golden Star M. Co. of Ontario have reached a depth of 185 feet in their shaft No. 1, 105 feet north and south from shaft at 75-foot level, 60 feet north and south from the shaft at the 150-foot level. They also have a winze connecting the first and second levels 100 feet from the shaft on the north. Total length of work, 590 feet; average width of vein from surface, measured every 5 feet, 4.8 feet; average assay, $24.47; lowest assay, $11.05; highest assay, $280; 1800 tons on the dump; are going down 400 feet before putting in a mill; are now putting in heavier hoisting machinery; working forty-five men on three eight-hour shifts.

The J. O. 41 G. M. Co.'s property adjoins the Golden Star mine, the vein running across the J. O. 41 property, which consists of 105 acres, well timbered and on the shore of Bad Vermilion lake. They expect to start operations the first of next month.

At the Foley mine work is being pushed in the north shaft, which has reached a depth of 345 feet. The 20-stamp mill is running day and night, turning out gold bricks, a shipment of which was made last week. About forty men are employed.

The shaft at the Olive mine is now 145 feet deep and is showing up a good, strong vein. Assays continue to show large values and the mill runs are very encouraging.

Duluth, Minn., March 4th, '98.

COLORADO.

The Christmas, Cripple Creek, is outputting one carload of ore per day. The greater part of the output is close to five ounces in gold.

The Gold Sovereign shipped fifteen tons of two-ounce ore.

The Legal Tender is shipping sixty tons of ore a day.

Though the Hull City has been doing considerable development work, the output for last week was fifty tons.

The Lucky Gus-Specimen started a seventy-five-ton shipment of $60 ore last week.

The Garfield-Grouse started the first shipment, consisting of seventy-five tons of $80 ore and ten tons estimated at $1500. Nearly 122 men are employed on the property.

The Colorado City is opening a vein of $40 ore.

The last shipment of the Porcupine at Cripple Creek consisted of ten tons; a large portion of the ore ran $400 to the ton.

The Rattler on Raven hill shipped thirty-five tons of $40 average value.

The Enterprise mine at Rico shipped twenty-eight carloads of ore during January and February, '97. For the same months of '98 the output has been fifty-two carloads.

The Tambourine mine at Delphi shipped 100 tons of ore which ran $15 per ton. They also shipped seven tons of second-grade ore which yielded $56 per ton, and 100 pounds of first-class which returned values at the rate of $1260 per ton.

The Centennial at Georgetown shows a pyritic ore 28 inches in width that carries two ounces in gold and twenty ounces in silver to the ton, and 6 or 8 per cent of copper.

The McClurg on the Fluorine at Cripple Creek yielded $27,000 gross in two months.

The Independence at Whitehorn is down 225 feet, with a train load of ore on the dump. Both assays and mill runs on this ore show that it runs from $60 upwards.

The Result at Leadville, which has been shut down for the last two months on account of the small margin between the cost of production and the selling price, has been started up again. The Result usually ships over 3000 tons of iron per month.

The Catalpa is shipping 150 tons of manganese iron per day to the Illinois Steel Works at Chicago.

The C. P. W. property near Black Hawk has been sold to Gunnell & Leslie for $10,000 cash. The main shaft is 120 feet deep. The new owners intend to put up a new plant of machinery and sink as rapidly as possible.

The White Cap at Leadville is producing about 200 tons per month of ore that carries lead and silver with a small percentage of gold.

The San Juan G. M. Co., residents of Milwaukee, will within the next two months erect a large stamp mill on its property in the Gold King district near Telluride. The property consists of fourteen claims, which have been sufficiently developed to warrant the erection of the proposed mill. The main ore body averages $62.50 in gold to the ton, taken across the vein, which is 10 feet wide. The president of the company is C. S. Otjen of Milwaukee.

A carload shipment was made last week by the Pharmacist.

Perkins & Fisher are shipping an average of fifty tons a week from the Pinto, all the ore coming from the 350-foot level.

The Denver *Republican* says the figures for the output of the Cripple Creek district for February show a gain over January, and an increase of more than a quarter of a million dollars over the corresponding month of the previous year. The output for the month was 32,240 tons, at an average value of $65, making a total of $1,149,400, as against $886,000 for the corresponding month last year.

The Freeland adit at Idaho Springs is 2600 feet long, is being cleaned out and the ore in sight will be mined. The upper adit on the Freeland property, known as the Diamond, is in a surface quartz that runs in lead, gold and silver. The shipments are netting about $25 per ton and the streaks are of good size.

The Forfar shaft at Central City is down 300 feet and levels have been commenced at 280 feet. This property is shipping fifteen tons of ore every day.

A small plant of machinery is to be placed on the Gomer claim near Central City, which is being operated for an English company. Nevadaville and Central City men have taken a lease on the Kirk near Nevadaville and will put up a plant of machinery.

All the mills at Idaho Springs are running night and day on local ores. The combined capacity is 1000 tons per day.

The Pharmacist, Cripple Creek, last week marketed forty tons of $100 ore and fifty-five sacks of high-grade rock.

The Modoc produced in February 300 tons of ore running from $50 to $700 per ton. The bulk of it is estimated to run $300 per ton. The company contemplates erecting new machinery to operate to great depth.

At Cripple Creek the Raven's net earnings for February were $15,000.

The Anna J. shipments last week were forty tons of 2½-ounce ore and 100 sacks estimated to run $300 per ton.

The Anchoria-Leland shipped 150 tons of smelting ore.

The Lucky Guss, on Bull, shipped fifty-five tons of $40 ore. Returns on sixty-five tons shipped last week gave $85 per ton.

A new producer has been added to the list near Ouray. Supt. Estie says they have plenty of good ore. A mill will be built on the property.

At the Cleopatra smelter the first forty-five days of this year sixty-four cars of iron ore was used as fluxing and forty cars of lime rock. Twelve cars of matte was shipped to the refinery. During that time 1125 tons of ore was smelted.

The Legal Tender at Cripple Creek sent out 1600 tons of ore in February.

The production of the Specimen for February was 120 tons, average value two ounces.

Returns for a carload of ore from the Zenobia at Cripple Creek netted $3052 20.

The February shipments from the Morse were 196 tons of a gross value of $5213 36.

The O. & N. tunnel at Ouray is in good ore and will average a car a day all through the coming season. The output is gold ore.

Work is progressing on the Hammond tunnel, near Ironton, which is in over 200 feet.

The Revenue continues to send down shipments of high-grade silver ore. It is the heaviest shipper in the camp and about 500 men are on the pay-rolls.

Hinzgen & Hoskins, on the Red Spruce, at Cripple Creek, are operating under a $60,000 bond. The shaft is down 115 feet and has opened a vein of galena which runs 129 ounces in silver and $35 in gold per ton.

The Wedge, at Ouray, as a shipper of high-grade silver, averages a car a day.

Crozier & Williams of the St. Thomas, of Beacon hill, opened an ore body which gives values of $25.60 per ton. There is a streak of black sand accompanying the rock which goes $148 per ton.

The Clara D. has shipped in round numbers $20,000 in the past six months. There is one drift on the property 100 feet in length, exposing for its full length an ore chute averaging 4 feet in width and running an average of about $30 per ton. The Clara D. adjoins the Anchoria-Leland and is owned by the Lexington Co.

NEW MEXICO.

Penn & Moad in the Lone at Red River have their incline down 130 feet and are 7 feet into a new lead of sulphide ore. They intend soon to put in steam hoisting and pumping machinery.

The Silver City reduction works, owned by Mrs. Hearst, are to be increased in capacity and equipped with every modern appliance.

The Red Bandana mine, in Moreno district, has 2500 feet of development work. The vein is large and the ore is said to yield $50 per ton. From ten to twelve tons are crushed daily.

The Santa Rita Copper and Iron Co. is shipping four cars of iron ore per day.

The Simpson Smelter, near Silver City, is running night and day on copper ore from the Hanover mine.

The Copper Queen is turning out gold and silver bullion. Three bricks have been shipped since the mill started.

A sample shipment of two tons of ore from the Western Belle mine gave returns of three ounces per ton in gold.

Herald: The Cochiti G. M. Co. expects to reduce the cost of treating Cochiti ores to $2 a ton.

The work at the Albemarle mine is progressing rapidly. Excavations for the tramway and new 125-ton steel mill is being pushed; seventy men are employed on this work alone. The work in the mine is making the usual good headway. Pipe laying from Peralta canyon to the Albemarle, five and a half miles, will begin shortly.

ARIZONA.

(Special Correspondence).—The new Vulture Mining Co. is in control of the old historic Vulture, sixteen miles southwest of Wickenburg. Between 1863 and 1888 this mine produced about $16,000,000. A great excavation, resembling an immense quarry, marks the place of the old workings. In the earlier years a 50-stamp mill was built near the present site of Wickenburg and the ore hauled from the mine. This old mill was long since moved away, and for the past four years Helm Bros. have operated a cyanide plant on the tailings. The latter handle sixty tons per day.

Before the Wickenburg mill was abandoned an 80-stamp mill was erected at the Vulture mine, much of the machinery in which is still in fair condition. That this mill did service is shown by the acres of tailings on which the new company is now operating a cyanide plant to the extent of ninety tons per day, the product being about $3 per ton. The Vulture appears to have produced a good specimen of free-milling ore down to the 500-foot level, below which there are sulphurets. The hanging wall is a porphyry and the footwall a slate formation. The work from now on will be below the 500-foot level, where a considerable quantity of water is encountered, which will be utilized in milling. In overhauling the old mill and starting it up, which it is the purpose of the company to do, concentrators will be put in, as the ore from now on will be more refractory than formerly. The underground workings of the mine are intact. They hardly show a stick of timber and the management claim it is a mine which needs no timbering. It is claimed the former mill product generally was $18 per ton of ore milled. The cyanide plant, in charge of John F. Johnston, is working with four solution tanks, each 6 feet deep and 26 feet in diameter, and the bed of tailings from the old mill will apparently keep the plant in operation several years. W. C. Davis of Tucson is manager of the new company.

The Eagle group is being developed by Mr. Davis, one mile west of the Vulture.

The Golden M. & M. Co., operating thirty-five miles west of the Vulture, has a 10-stamp mill and a small cyanide plant which will be started to work soon. The members of this company are Chicago and Milwaukee men. The ores are a sulphuret of iron, carrying values in gold.

The Garcia mine is eight miles south of Wickenburg, at which a 10-stamp mill is being erected. The property is owned by people from London, Canada.

Collins is a gold camp forty miles west of Congress. Some good development is reported there by M. L. Grover. This is in the main range of the Harqua Hala mountains, where he says there is an abundance of water and timber. It is about 6000 feet above sea level and is perhaps the least explored of any region of Arizona. WASCOTT.

Wickenburg, Ariz., March 5th, '98.

(Special Correspondence).—Within the past year the Copper Queen at Bisbee has increased the capacity of its smelting plant. There are now four copper blast furnaces, three sets of converters and three Tilton wells in use. By means of the wells, after the slag has been taken off, the valuable material is conveyed directly from the wells to the converters, thus avoiding resmelting. The engine capacity has also been increased. The plant handles about 600 tons of ore per day, from which is produced forty to fifty tons of copper bullion. The Copper Queen Co. is developing new copper mines at a point 108 miles south of Bisbee, in Mexico. The plan is to build a railroad from Bisbee to the new mines if they prove of sufficient value to justify a large plant.

The South Bisbee Mining and Townsite Co. has acquired a large area of ground east of the Copper Queen properties and is doing considerable prospecting work. WASCOTT.

Bisbee, Ariz., Feb. 26th, '98.

(Special Correspondence).—At Harshaw the World's Fair is working with the usual force of men. This is a silver producer.

In Washington Camp the Duquesne has undergone pretty thorough development. The values here are chiefly copper, which is in the form of carbonates near the surface, and a sulphide at the present depth of 350 feet. Much of the ore is strongly zinciferous. Thorough and numerous tests have been made, with the view of choosing a process best adapted to the ore. George Westinghouse owns the property, and reduction works will doubtless be erected on the ground as soon as a conclusion is reached as to the method. In the same locality a mine and concentration mill are being operated by the manager of the Canyon City (Colo.) Zinc-Lead Smelter. The ores are similar to those of the Duquesne and the product is sent to Canyon City.

The Pride of the West, also located in Washington Camp, has shipped 6000 tons of ore. The owner, N. H. Chapin, states that the values have averaged 17 per cent copper, three ounces silver and one-tenth ounce gold. This locality is well supplied with wood and water. It is about twenty miles southeast of Crittenden.

The Commonwealth mine and mill at Pearce, Cochise county, are operated with a force of about 100 men. The ores are free milling and the values are high in gold and silver. The mill is of a German pattern, with balls, vanners and settlers. The very high grade ore is not milled, but is shipped to the smelters. This property is eighteen miles southeast of Cochise and the workings are in a hill which rises 300 feet from a level plateau.

The Middle March is a copper property in Dragoon mountains, eight miles west of Pearce. Development work has resulted so favorably as to make the owners feel justified in erecting a smelter. The machinery for the plant is on the ground and being set up. The Dragoons are the base of considerable development on copper claims. WASCOTT.

Pearce, Ariz., March 2nd, '98.

(Special Correspondence.)—Chas. Davies has the Peery mine and mill leased, near Stanton, and is making a success of the work. The mill has ten stamps and two concentrators. Twenty tons a day are being milled, resulting in saving two-thirds of the values on the plates and the most of remainder in the concentrates; a total saving of $15 per ton.

The Gold King M. and M. Co. have a group of claims on Rich Hill, which they are developing, their tests being made on a prospecting mill. Geo. B. Upton, Supt., says the purpose is to errect a 10-stamp mill.

The Rich Hill Gold Co., owned chiefly by Mr. Hayden of Cincinnati, is developing its properties from a 200-foot shaft. The entire district in the vicinity of Rich Hill produces a gold-bearing sulphuret of lead and iron. The Hayden property contains some antimonial lead, where the formation is a contact between slate and granite. This property is in charge of A. Peterson.

Placer workers and nugget hunters have found Rich Hill a profitable field for the last thirty-five years. Experienced miners are beginning to get a foothold in the district, and with a little capital to help them along their work will soon begin to tell. Stanton and Rich Hill are seven miles from the Santa Fe, Prescott & Phœnix railroad at Congress Junction.

The Fool's Gulch mine and mill remain closed down. The mine is claimed to be a good one, but it is believed a mistake was made as to the construction of the reduction plant, which was built at considerable outlay.

Stanton, March 7th, '98. WASCOTT.

The Congress in doing crosscut work struck a body of ore at the 650-foot level and also on the 500-foot level, and it may be said that they have practically opened a new Congress, bigger and better than the old one. They are working to strike the ore body of the cross-lead at the 1000-foot level.

A. O. Brodie, Gen. Mgr. Crown Point, has made 1990 feet of development work and is down 300 feet. At the 200-foot level a body of ore 4 feet in width was struck and it has continued to the present depth. The assay value is from $109 to $155, nearly all in free gold.

The shaft on the Merrimac, near Chloride, is being sunk rapidly and high-grade ore taken out. A steam hoist will be erected.

The Altata is producing good ore in quantity. There is considerable copper in Altata ore as well as gold and silver.

The Schuylkill mine is producing ore in every place it is worked. Supt. Theis will erect a steam hoist at once.

The Tennessee at Chloride has reached the ore chute and the ore extends the full width of the shaft. The company will at an early day put up a crusher and a number of concentrators.

The Phœnix *Republican* says fifty tons of high grade gold and silver ore is delivered monthly from the Commonwealth at Pearce, to Cochise station. Two shipments of bullion are made monthly. The ore has shown generally $20 gold and $80 silver. Depth reached the 1st of March was 500 feet, considerable drifting and crosscutting being done.

A cyanide plant will soon be put in operation on the Mammoth mine at Goldfield.

A body of shipping ore has been opened up in the Green Linnet mine, Mohave county.

A. W. Warwick, at Bill William Fork, is pushing work on the development of his claim and contemplates erecting a copper smelter.

The Phœnix *Republican* says water has been struck in the King of Arizona mine, in Yuma county, at a depth of 1000 feet, and that there will be sufficient water to supply a 40-stamp mill, which the company will put in at the mine as soon as this is determined. The tailings dump at the present mill site will be worked with cyanide and the tanks moved to the mine when the dump is cleaned up.

MEXICO.

The ore in the winze of the San Felipe mine at Real del Monte is widening and improving in value. Ore is being extracted from two points and development work pushed in three more.

In the Cabrera there has been sunk a winze 25 meters deep in good ore.

The San Miguelito mine in Sonora shipped a carload of silver and copper ore.

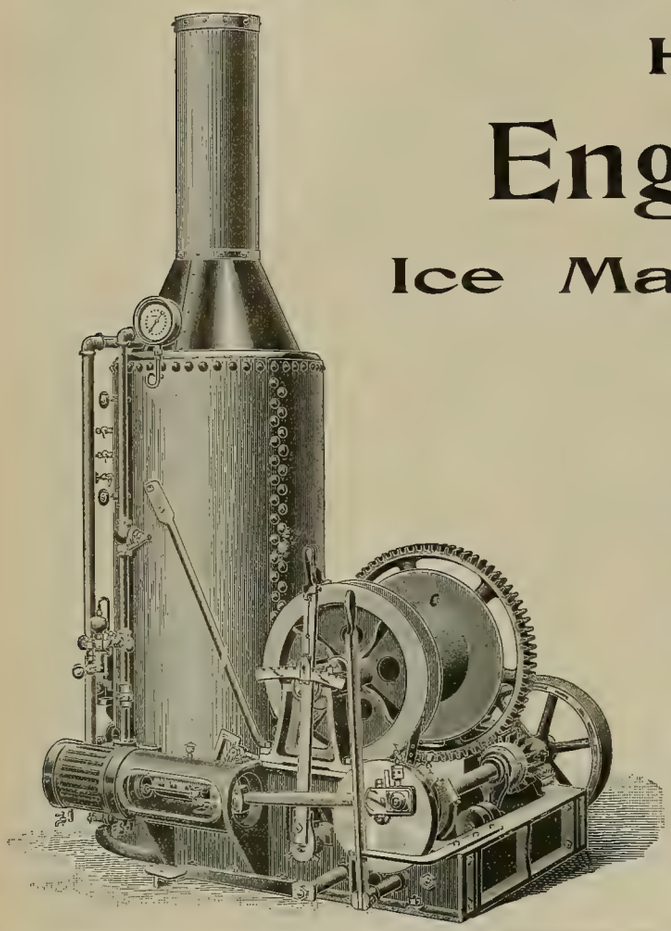
The Ibarra mines at Santo Domingo are closed down except for the working of the tailings. A good lead has been struck in the Viznaga mine at Alamo; work will be pushed.

On the line of the Mexican Central the Compani Mineral Penoles employs 3000 men and ships between 700 and 1000 bars of silver, weighing ninety-five pounds each, every day, for shipment to Germany for refining. The company is getting out 1500 tons of ore per week and expect to increase the output to 2000 tons.

At Aguas Calientes they smelt from 500 to 600 tons of ore per day and employ 1000 men. They have seven furnaces and are planning to add three more.

New York and California capitalists have bought the old mining properties of the Parkman estate, in Guanajuato. The company is the Guanajuato M. & M. Co., F. G. Corning of New York president; the Gen. Mgr. is J. Z. Judd of San Francisco, the Supt. and local engineer J. W. Pender, S. B. Connor engineer. There are five mines in the group, and the San Francisco reduction works, the latter having cost $100,000. There is a shaft 16 feet in diameter and 900 feet deep, and the tunnel 5000 feet long. The ore runs from $3 to $10 gold and from twenty to thirty ounces silver. While at present a 20-stamp mill is to be used, power sufficient for an 80-stamp mill is to be set up, and Mr. Judd thinks the full eighty stamps will in about eight or ten months be in operation. The M. P. Boss process is to be employed.

BAKER & HAMILTON,



HIGH GRADE

Engines, Boilers,

Ice Machines,

Mining Tools,

Etc., Etc.

THIS CUT represents our Single Engine **PROSPECTORS' HOIST**, from 6 H. P. up, constructed with sectional iron frame, reversible link motion, improved brake, etc. Engine and Boiler can be disconnected and used for other purposes. Hoist and Engine can be shipped knocked down, in pieces suitable for transportation over difficult roads and trails.

We also carry Double Engine Hoists, same type, with or without Boilers, from 12 H. P. up.

These outfits are built in the most substantial manner possible, and on the most approved principles. We recommend them in every particular.

Eastern and Foreign Office, Johnstone Building, No. 30 Broad Street, New York, N. Y.
SAMUEL DEXTER HAYWARD, Manager.
Cable Address, "Bennetts," Denver or New York.
Sole Manufacturers (except for the State of Colorado) under all the Patents Covering the "Bennett Amalgamator" Plants.

These plants, being the outcome of many years of evolutionary experiment in the field of their actual operation, are constructed in the most thoroughly substantial and workmanlike manner, of the best material the market affords, with a view to their maximum efficiency, strength and durability; the operating portions almost exclusively of steel, to gauge, and therefore interchangeable, and having been thoroughly tested as to all points, under widely varying conditions, are fully warranted to perform as indicated in the following table:

FOR "GULCH," "BAR" AND "HILL" DIGGINGS.					
Number.	Capacity in cubic yards of gravel per 24-hour day.	Total operating cost in cents per cubic yard of gravel.	Miners' inches water required where water is scarce or abundant.	Approximate total weight inclusive of power plants.	
1...	2500	2 to 4	25 to 150	150 tons	Single operating plant
2...	5000	2 to 3	50 to 300	200 tons	Duplex operating plant
3...	7500	2 to 2½	75 to 450	300 tons	Triplex operating plant

SWAMP AND RIVER-BED PLANTS.					
Number.	Capacity in cubic yards of gravel per 24-hour day.	Total operating cost in cents per cubic yard of gravel.	Miners' inches water required where water is scarce or abundant	Approximate total weight inclusive of power plants.	
4...	2500	2 to 4	Barge	250 tons	Single amalgamator
5...	5000	2 to 3	Barge	325 tons	Duplex amalgamator

In general terms it may be said these plants consist of the electrically operated dredge and amalgamator, mounted either on steel barges for swamp or river-bed mining, or steel-bodied cars for "gulch," "bar" and "hill diggings," together with the necessary power plants for their operation. Several operating plants, either in close proximity or scattered over a large district, may be operated from a single power station, which may be situated at any convenient point within a radius of a few miles, at railroad depot or where water power can be utilized. The river plants, complete in themselves (each barge containing its own power), are made single or duplex; any suitable number of either can be operated on a river, each independently working its allotted section from surface to bedrock, and rim-rock to rim-rock. All these plants are built with a view to easy transportation, in "knock-down" shape over ordinary mountain roads, and, on special order, the size and weight of separate parts may be still further reduced. In the foregoing table the figure representing the smaller quantity of water required applies to cases where, for any reason, it is desirable or necessary to use the water over and over. The water required may be taken from below the placer, thus obviating the necessity of long ditches, etc. Since these plants neatly pile their debris on the cleaned-up bedrock of the ground worked, they may be said to create their own dump, and hence are enabled to successfully operate on flat ground, or where ordinary dumping facilities are lacking. This peculiarity also renders them independent of "debris laws." The wonderful perfection with which these plants extract the finest, microscopic particles, such as are held in suspension in water, or, when dry, ascend in a gentle current of air, constituting in bulk a perfectly impalpable powder (send for samples), renders them particularly valuable and indispensable in cases where, owing to the fineness of the golden particles, very rich mines are unavailable for profitable working by the hydraulic or sluice processes.

All plants are furnished with duplicate parts and wearing pieces to cover at least two years' constant use, while the life of the plant is conservatively placed at twenty-five years' active service. For further information address as above.

MINERS, ATTENTION!

We beg to call attention to our RISDON HAMMERED PROJECTILE STEEL SHOES AND DIES, which are made of a special quality of steel, are hammered and then compressed in moulds so as to give the greatest possible density.

These Shoes will outlast any other make and will not chip or cup.

We have attached a sketch showing sizes; fill in the size of your Shoes and Dies, and order a trial set.

Our prices are as low as any, and the article we offer should commend it to all mine owners and mill men.

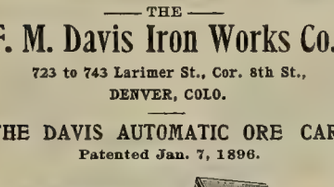
WILFLEY CONCENTRATOR.

WILFLEY CONCENTRATOR.

PRICE $450 F. O. B. SAN FRANCISCO.

One of these machines will take the place of two or three belt concentrators of any style and do very much better work.



SEND FOR CIRCULARS.

Some Practical Reasons Why the Wilfley Concentrator Should Be Used in Gold Mills:

1. It will successfully handle three or four times more material than any belt Concentrator made, without exception.
2. It will save more sulphurets in proportion while so doing, and catch any float gold, amalgam or quicksilver which may escape from mortars or plates.
3. It will make cleaner and much more valuable concentrates, thus saving useless expense for transporting valueless material, as also extra cost for treatment.
4. It requires little or no attention when once adjusted and no expert is required to either adjust or run the machine.
5. It will save much expense in power and room, and the first cost of a mill requiring concentrators.
6. It has no expensive belts to crack and wear out nor complicated machinery to keep in repair.
7. It is the only sensible plan of concentration, as any kind of material can be worked, which is not true of any style of belt machine.

PATENTS

DEWEY, STRONG & CO'S PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & CO.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

GOLD IN COLORADO!

Colorado has within its limits some of the greatest gold mines that has ever been discovered. In Cripple Creek in 1892 there were a few prospectors looking over the hills; in 1895 the camp turned out over $8,000,000 in gold. Leadville, the old bonanza camp and the mineral product of which made Denver what it is to-day, is becoming a big producer of gold. New inventions for working low-grade gold ores, together with the discoveries made to work rebellious ores, have opened up a field for the miners such as they have never enjoyed before, and Colorado has inducements to offer such as no other district in the world possesses; the record of the State in gold production for the last three years speaks for itself. Among the other prominent camps in the State are Telluride, Ophir, Rico, Silverton, Mineral Point, Durango, La Plata, Ouray, Saw Pit, Ironton, the Gunnison district and many others. New finds are being made and new camps are springing into existence every day. The Denver & Rio Grande Railroad, which is the pioneer road of Colorado and which has always been the miner's friend, reaches all the mining camps in Colorado. For elegantly illustrated descriptive books, free, of mines in Colorado send to

Market Reports.

The Markets.

SAN FRANCISCO, March 10, 1898.

Jobbers report business quiet the past week, due to a falling off in the demand from outfitters for Alaska and Northwest Territory. It is the current opinion that when navigation on the Yukon opens this year there will be a large call for goods from here for shipment to firms in business up there. The Alaska Packers' Association are large buyers for goods and outfits in its line. The Alaska Commercial Co. will begin to send goods forward in April. It is stated that they will send several thousand tons; in hog products alone they will send over 1000 tons. Considerable mining tools and machinery will go forward also. Dry weather in the southern part of the State continues to be a disturbing factor in the market. It causes some uneasiness, although the more conservative think reports are exaggerated and crops will be larger than claimed, owing to there being so much land under irrigation. In the valleys of Sacramento, Sonoma and a large part of San Joaquin the prospects are good, particularly in the two former, which were never better for large crops.

The local money market is easy, with more disposition to put out funds, now that tax day has passed. The large sums of money sent out of the State, hidden or else accidentally lost, are now available for loaning. There is more disposition to place funds on realty in this and neighboring cities, but the inquiry from this source is light in the absence of any movement in the real estate market. The Australian steamer has arrived with another heavy consignment of gold, bringing the total received so far this season from that quarter up to over $8,000,000. Other shipments are expected from there, owing to sterling bills favoring such a course. Merchants report collections slow, but as outstanding accounts are considerably below the corresponding time in former years the slow collections do not cut much of a figure. Accounts in the dry belt in the southern part of the State are closely scrutinized, but in the more favored sections, or where farm prospects are of the best, fairly liberal credit is extended when desired. Receipts of bullion from the mines are said to be fully up to last year in this month.

New York Silver Prices.

NEW YORK, March 10.—Following are the closing prices for the week:

	Silver in— London.	N. Y.
Friday	25⅛	54¼
Saturday	25⅜	54⅝
Monday	25 3-16	54⅜
Tuesday	25⅛	54¼
Wednesday	25⅛	54¼
Thursday	25⅛	54⅜

Refined Silver, per oz., 1000 fine	54⅝
Mexican Dollars nominal	46@—

SILVER.—The market has ruled weak throughout the past week, but at the close it seems to be steadier. The markets at the East and abroad are quite sensitive to any unfavorable news or reports. This is witnessed in the decline at New York on reports put out that India would impose an additional import duty. This we can hardly look for, although the report may possibly be correct, owing to India having a bumper crop of both rice and wheat, but particularly of the former, the exportable surplus of which is put at 1,900,000 tons. The tea crop is also large. To move the rice and wheat crops silver will have to be imported, owing to the mass of the natives of that country not knowing any other metallic currency, and it would seem the part of wisdom to let the white metal in freely. It is quite possible that the Indian government wishes to impose additional duty so as to keep the price up at home. Shipments of silver from New York to Europe continue free.

MEXICAN DOLLARS.—The demand continues light and the market is easy.

COPPER.—The market has held to strong prices. New York mail advices report a sale of Lake Superior at 12c, but orders for more at the same figure were turned down. A London cable, under date of March 1st, reports that large orders are being placed for first-class steamships and also for warships, as well as for railway locomotives. The continental demand has also been active, with numerous inquiries for electrolytic copper. New York mail advices state that there is a continued free export and home demand. An official of the Calumet & Hecla mine is reported as follows: "We are out of the market for the present, for, although we still have copper, we do not care to bring it overland from Lake Linden, and we do not know whether we have sufficient copper in the exact shapes wanted. We make about 100 different shapes, and it sometimes takes a month to fill the orders after they are received. We have sold for March, April and May delivery. I believe the present advance in copper is legitimate, and I believe the price may reach 12c. That figure, however, is likely to be the maximum for the present, unless the domestic demand becomes still more urgent or unless the price abroad advances."

Our market is quoted as follows:

Ingot casting, jobbing	13¼@—
Ingot " wholesale	13 @—
Sheet copper	16¾@—
Bolt	¼ and 5-16, 20c; ⅜ and larger, 16½

TIN.—The market for pig is strong at the East and abroad. Ours is in sympathy. Contrary to the rule, plates do not appreciate. This is doubtless due to a continued competition in selling at the East. In our market there is more or less cutting on big orders.

The market is quoted in jobbing lots as follows:

Pig	4 75	@	5 00
Sheet	....	@	6 50
Pipe	5 30	@	5 80

LEAD.—The market has strengthened, but is not quoted any higher. Eastern advices state that the tendency is to more firmness.

Pig, per lb., jobbing	—@ 15
Plate, I C coke, heavy, per box	$4 10@4 25
" " " light, " "	4 00@—

SHOT.—Our market is quoted as follows:

Drop, sizes smaller than B, per bag of 25 lbs	$1 35
Drop, B and larger sizes, " "	1 60
Buck, Balls and Chilled, do, " "	1 60

QUICKSILVER.—The market rules steady at last week's advance.

Our market is quoted at $40 for domestic consumption and $38@37 for export to the west coast of Mexico.

IRON.—The consumption with us is practically the same as in January. The market is unchanged. The East reports heavy consumption and free exporting, but without any visible effect on the markets there owing to competitive selling.

COAL.—The market is easy with fair receipts, good stocks on hand and a falling off in the demand. Receipts for the week ending with Tuesday were as follows in tons: Puget Sound, 6863; Nanaimo, 7300; Coos Bay, 1025; Departure Bay, 2500. Total, 17,688.

SPOT FROM YARD—PER TON.

Wellington	$10 00@— —
Greta	6 50@— —
Nanaimo	8 00@— —
Gilman	6 00@— —
Seattle	6 00@— —
Coos Bay	5 00@— —
Cannel	10 00@— —

TO ARRIVE—CARGO LOTS.

Australian	6 25
Liverpool Steam	7 00
Scotch Splint	— —
Cardiff	— —
Lehigh Lump	12 00
Cumberland, bulk	9 00
Egg, hard	10 50
West Hartley	7 25

POWDER.—The demand for mining is reported quite heavy.

The market is quoted as follows for Hercules: No. 1, from 11¼c to 17¼c, according to strength and quantity; No. 2, from 9c to 11c, according to strength and quantity.

PLATINUM.—The market is steady. Our market is quoted in a jobbing way at $16 per ounce and for scrap $11 per ounce.

ZINC.—The market is steady. Our market is quoted at 10@15c, according to thickness.

ALUMINUM.—The market is steady. We quote in jobbing lots at 45@50c per pound for ingots.

BORAX.—The market is very strong with a good demand ruling. There was shipped by water to New York last week 100 tons.

The market is quoted as follows:

Refined, in carload lots, in barrels	7¼
Refined, in carload lots in sacks	7
Powdered, in car lots, in barrels	7¼
Concentrated, " in sacks	6¾

Chemicals.

The same conditions prevail that have ruled for the past few months. The demand is confined to requirements, with no disposition shown to carry much in stock. At New York the situation is the same as ours. There is no line that offers inducements from a speculative point. Nitrate of Soda is the only article in which there is any trading, and the prices for it bob around quite lively. At last advices prompt delivery was scarce and strong, but other deliveries were easy.

CYANIDE OF POTASSIUM.—The market is steady. Our market is quoted for chemical pure, 32 cents per pound for jobbing lots, and 29 cents for carloads.

SULPHURIC ACID.—The market is firm. We quote in a jobbing way at 1½c per lb. for 66%.

ACETIC ACID.—The market is firm at 6 to 12c per pound from store for carboys, according to make.

NITRIC ACID.—Our market is reported steady from store at 6½@7c per pound in carboys.

BONEASH.—There is a good demand for export. Our market is quoted in a jobbing way as follows: Extra, 4c a pound; No. 1, 3½c; No. 2, 2½c.

BLUE VITRIOL.—Our market is steady. We quote in a jobbing way at 4c per pound.

SPELTER.—The market is steady. We quote our market in a jobbing way at 5c per pound.

BISMUTH.—The market is firm. Our market is quoted in a jobbing way at $1.40 a pound.

SODA ASH, 58% (Le Blanc process).—The market is steady at $1.55 per 100 lbs. in a jobbing way.

CAUSTIC SODA, 60%.—The market is steady at 3c per pound in a jobbing way.

HYPOSULPHATE OF SODA.—The market is quiet at 2½c a pound from stores.

NITRATE OF SODA.—A cargo came in the past week. It was placed before shipment. Our market is quoted from store at 4c for 95%.

PHOSPHORUS.—The market is steady. We quote in a jobbing way at 70 to 75 cents per pound.

Mining Share Market.

SAN FRANCISCO, March 10, 1898.

The market has hung around the past week at prices showing very few changes. Several assessments were levied and several more are to come on, but whether in this or next month no one seems to know outside of the manipulator for the money pool, and he appears to regulate them by what he is trying to do. It seems to be the opinion with shrewd and successful operators that he is having a line put on now so as to make holders let go at current low prices, by which the more desirable shares can be concentrated. If this opinion is correct, it will be substantiated by the action of the market, for if more shares are wanted, and it is a case of freeze-out, prices will not be advanced while the assessments are on; but if it is assessments, and not shares, that are wanted, then there will be an up-move before they are off, so as to get outsiders to pay the assessments; for the general public are known to hold, and not sell, when the market looks strong at higher figures, particularly when points are well distributed that a big deal is at hand. With the better informed there is a growing belief that the war scare has been used by the manipulator to keep outsiders from buying at present absurd low prices; but now that the conviction is growing there will not be a war, the war-scarecrow influence will not be felt; but what other scare will be brought out it is hard to say. The prices at which the shares are selling do not bring the total aggregate values of the Comstock mines to much over $1,100,000, and the history of the Comstock is that, when they get so low, there is a good substantial advance. The condition of several mines is encouraging. In Sierra Nevada quite a body of ore is being uncovered, as there is in Occidental. Work in Ophir on the 1000-foot level is far enough to the west to justify the use of a drift to see what is ahead. It is only justice to shareholders that a drift should be in several hundred feet, if necessary, so as to tap the gold ledge lying to the west. In Chollar and Potosi it looks as if the kill-time policy should be stopped and active exploiting on or about the 1100-foot level be started. While they may not find much there yet, it may induce them to go still lower when something very good will be found, if it is policy to do so. There is no doubt that the low price of silver has considerable to do with not finding ore. It is reported that more active work has been started in Yellow Jacket; but no one seems to have confidence in the management of this mine. Crown Point, Belcher, Overman and Caledonia so far are not getting anything but assessments from any ore found, and therefore any new or important work started in anyone of them is looked upon with suspicion. The belief prevails that the management of Gould & Curry ought to prospect the Brunswick lode to the north on the Comstock tunnel level. It is known with the older mining men that some work was to be done to the north by the tunnel people and that ore was found which averaged around $40 a ton. If this ore should be followed for some distance and found to assay from $30 to $50 a ton, it will be quite a factor in exciting speculation in Savage, Gould & Curry, Best & Belcher and Con. Virginia, particularly if the ore is found on the upper levels, which all indications warrant their expecting.

The news from the Comstock mines is confined, so far as public advices go, to official letters filed every week, and, with two or three exceptions, they are as barren of anything of interest to the average dealer as a picked bone is of meat for a hungry a imal. When some important work is being done it is so hedged in with red-tape phrases and stereotyped distances as to cause disgust more than interest. Some of the letters it would puzzle a smarter man than a Philadelphia lawyer to make out so as to find where work is being done—but this may be part of the game, and if so, some of the mine superintendents are adepts at performing their parts. The northwest drift in Utah is st ll in seams of clay and porphyry. In Sierra Nevada they will resume work next week in the raise from the Riley tunnel level. When this is completed they ought to take out considerable ore and at the same time continue exploiting at other points. They are still driving ahead in the Riley tunnel. They are pushing ahead in the north drift on the 900-foot Union shaft workings level. The drift is in about 550 feet from the Sierra Nevada shaft. The face is in porphyry. In Union they have stopped No. 2 east crossdrift on the 960-foot level and started west crossdrift No. 2 on the same level. They are still driving ahead east crossdrift on the 1000-foot level of Mexican. This crossdrift is a good time killer and money depleter. It is not in the right direction to strike much if any ore. In Ophir they are still going west on the old Central tunnel level and also 1000-foot level. They are in respectively over 460 feet and over 940 feet. They are still drifting north in Andes on the 175-foot level. They are said to be paralleling the vein. In Con. Virginia no new work is reported officially. According to the last letter filed the work is on and around levels 1550, 1650 and 1750. The letter indicates that the work is preliminary to more active exploiting, but how soon no one seems to know outside of persons close to the inside. There is no change in the work in Best & Belcher and Gould & Curry or formation of material encountered. In Savage they are cleaning out and repairing the main west crossdrift on the 130-foot level. They are in over 400 feet. In Chollar they are crossdrifting to the west on the 1000-foot level. The official letter from the superintendent says that good progress is being made in repairing the main incline below the 1100-foot level. No change is reported in the Potosi-Bullion work. In Alpha they are driving ahead in west crossdrift from the upraise from the 500-foot level. Owing to a heavy flow of water, necessitating enlarging the boxes, no work was done in pushing the west crossdrift that is being run jointly by Confidence, Challenge and Con. Imperial. The Con. Imperial surface tunnel was, at last advices, in old fillings. Reports are current that more active work has been resumed by Yellow Jacket. No work is reported in Crown Point. It seems as if they are waiting for the result of the two milling tests of low grade ore. In Belcher they are crossdrifting to the east on the 850-foot level. They hoisted forty-one tons of ore last week. The assay value is returned at a little over $18 a ton. In Overman they are extracting a few tons of ore. In Caledonia active work is being done on the 1100-foot level. They are preparing, in Justice, to sink on the ore found in west crossdrift No 2. The bullion yield of ore milled was $1225 gold and $637 silver.

From the Brunswick lode there is nothing of special interest additional to what we reported last week. Work is progressing fairly well at the different points where they are working. Persons who keep informed on it through official advices and personal inspection express themselves as well pleased with the results so far. They think that with more work in two of the mines good results will follow. The joint work by Con. Virginia, Best & Belcher and Gould & Curry is confined to a west crossdrift on the 600-foot level, a south drift on the same level, and sinking the shaft. The latter is down on an incline about 850 feet, while the west crossdrift is in about 430 feet and the south drift about 550 feet. The official letter from Chollar is unimportant and about the same as filed the preceding week. Shaft No. 1 is being sunk at the rate of about 17 feet a day. On the main south drift in Potosi on the 600-foot level they are running a crossdrift east and another west. They expect good results from the latter. The official letter from Occidental reports work to the west on the 550-foot and 650-foot levels. They are also driving ahead the main south drift on the latter level. They are running north from the west crossdrift on the 750-foot level, along the foot wall of the vein. It is showing seams of high-grade ore.

The following illustrates the changes of the week:

Three Dollars Brings This Paper One Year--Fifty-Two Issues.
Can You Afford To Be Without It?

THE BROWNELL "PATENT LIP" FLANGE FRUE VANNER BELTS.

It has taken years of ceaseless testing and experimenting to produce the superior belt which we now offer, with elastic flanges and pliable body reinforced with specially woven duck. Every belt is manufactured by experienced workmen, and carefully tested on machines especially built for that purpose; consequently we are to-day manufacturing the best belts that mechanical ingenuity, combined with honesty of construction, can possibly produce.

RAWHIDE GOLD MINING COMPANY,
JAMESTOWN, TUOLUMNE Co., CAL., Feb. 21, 1897.

J. S. BROWNELL, ESQ.—DEAR SIR: Replying to your query of Feb. 15th, will say that I have used your Patent Lip flange belt more than one year, and judging from their appearance after more than one year of hard service, I do not hesitate to say that they are the best belt I have ever used and I take great pleasure in testifying to the fact. Yours truly, W. A. NEVILLS, President.

AMADOR CITY, CAL., Feb. 18, 1897.

MR. J. S. BROWNELL—DEAR SIR: I take pleasure in saying that I have used your Patent Lipped flange belt for several years while connected with this company, and I consider them the best that we have used. The quality of rubber in the flange seems to be the best, and we are not bothered with the flange cracking and thereby destroying the life of the belt. At present we are using 14 concentrators, and have in use several kinds of belts. We consider your Patent Lipped flange the best. Yours very truly, THE CONS. SOUTH SPRING HILL G. M. CO.
By JOHN R. TREGLOAN, Superintendent.

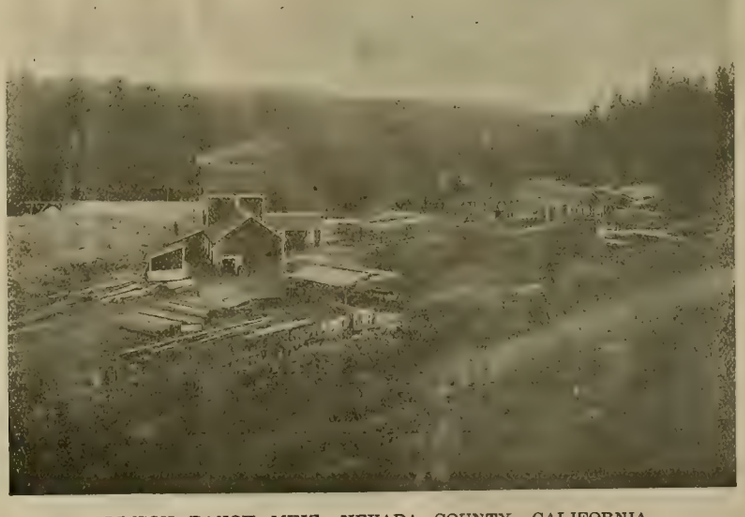
No. 1967.—VOLUME LXXVI. Number 12. SAN FRANCISCO, SATURDAY, MARCH 19, 1898. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

Gold Mines of Nevada County, California.

From a pamphlet published by the Nevada county exhibit at the recent mining fair in this city are taken the engravings on this page and page 313. They portray scenes familiar to every California miner and are of interest in connection with the magnitude of the operations they represent. The general appearance of the North Bloomfield mine, illustrated on page 313, has been made familiar this year to the thronging thousands who viewed its reproduction at the Mechanics' Pavilion. If this mine were in the frozen darkness of the Klondike, or the arid torridity of Western Australia, it would be a world's wonder, but being in California it is taken as a matter of course, and the millions it has turned out in the last forty years have been considered as merely something in the usual order of things where California is concerned. The Omaha mine, illustrated on this page, has in present operation 30 stamps; it has produced about $3,000,000, and is being worked to a depth of 1600 feet. The Allison Ranch mine is a good example of the renewed activity now manifest throughout California. It was worked to a depth of only 500 feet on the incline and produced $2,400,000. Flood and Mackay have taken hold of it and the presumption is that its history will be that of other deep-level California mines, which on being pushed deeper after years of cessation of all work have doubled and trebled the millions they had produced from the upper levels. The Champion mine is also portrayed on this page, in the Nevada City district, in which is located what

CHAMPION MINE, NEVADA CITY, CALIFORNIA.

OMAHA MINE, GRASS VALLEY, CALIFORNIA.



has been dubbed the great father lode. The Champion is at present the deepest and most important mine in the district. It is being worked to a depth of 2200 feet on the incline, a 70-stamp mill being in continuous operation. The Champion has a gold bullion record of over $6,000,000. The Kate Hayes Mining Co., operating at North San Juan, is another example of a good property ably managed.

Nevada county furnishes many prominent and successful examples of hydraulic and quartz mining. Since gold was first discovered in California, Nevada county has contributed an aggregate yield of over $210,000,000; of this great amount about $125,000,000 has been produced by the hydraulic mines and $85,000,000 by the quartz mines. During the recent years the quartz mines have produced more than the hydraulic, largely because of Federal restriction.

One of the famous quartz mines of the State is the Eureka-Idaho-Maryland, in the Grass Valley district. In this property three mining companies have worked one continuous ore chute to a depth of 2200 feet, a distance of 6000 feet, and have produced nearly $20,000,000, of which more than one-half was paid in dividends. It is still and promises to continue to be a producer. The Empire, also in Grass Valley, has probably been worked the most continuously of any similar mine in the State. Other mines have stopped and started, but the Empire has kept on for forty-eight years. It has produced over $7,000,000, and is now being worked at a depth of 2400 feet on the incline. Like the Empire the North Star, another famous Grass Valley mine, keeps a 40-stamp mill in constant operation, is being worked at a depth of 2400 feet on the incline, and has a gold bullion production record of about $6,000,000. At present in Grass Valley district about 380 stamps are dropping, and in the Nevada City district 330.

"Abandoned" mines are proving their worth. The Reward, near Nevada City, is a good example. After years of idleness a company some time ago took the property, drained it, started development, last month cleaned up $6000 and have begun to pay dividends. The Texas and Bellefontaine are also examples of "abandoned" mines, now profitable. The Pennsylvania mine at Grass Valley is producing an average of $6000 in gold every month. This property is an apt illustration of what local enterprise has accomplished in Nevada county mining. The stock is nearly all in small holdings. Three times had the property been closed down. A last effort among the stockholders to push to depth rewarded them on the 800 level. The ore body is fair size and high grade. The mine has paid 5 cents per share every month for fifteen months and has a cash reserve in bank of $30,000.

Great though the yield of gold in this county has been, the output is but an indication of the golden wealth in the 958 square miles of territory within its boundaries. The present prosperous condition of the mining industry in Nevada county illustrates forcibly that improved and economical methods, intelligent management and facility of transportation, make possible satisfactory returns from invested labor and capital in that or any other of the great gold-producing counties of California.

ALLISON RANCH MINE, NEVADA COUNTY, CALIFORNIA.

MINING AND SCIENTIFIC PRESS.

ESTABLISHED 1860.

Oldest Mining Journal on the American Continent.

Office, No. 330 Market Street, San Francisco, Cal.
Telephone Number, Davis 771.

ANNUAL SUBSCRIPTION:

United States, Mexico and Canada..... $3 00
All Other Countries in the Postal Union..... 4 00

Entered at the S. F. Postoffice as second-class mail matter.

J. F. HALLORAN.....General Manager

San Francisco, March 19, 1898.

THE LARGEST GUARANTEED CIRCULATION.

In all the States of the Far West and the Pacific Slope, consisting of California, Oregon, Washington, Idaho, Montana, Wyoming, Colorado, New Mexico, Arizona, and Utah, the largest circulation credited to any publication devoted to engineering and mining is accorded to the MINING AND SCIENTIFIC PRESS, a weekly, published at San Francisco, Cal.; and the publishers of the American Newspaper Directory will guarantee the accuracy of the circulation rating accorded to this paper by a reward of one hundred dollars, payable to the first person who successfully assails it.—*American Newspaper Direct ory.*

Among the engineering and mining papers in California, none has credit for so large a regular issue as is accorded to the MINING AND SCIENTIFIC PRESS, published weekly at San Francisco. In fact, it fully equals five times the combined issue accorded to all the others, and the publishers of the American Newspaper Directory will guarantee the accuracy of the circulation rating accorded to this paper by a reward of one hundred dollars, payable to the first person who successfully assails it.—*American Newspaper Directory.*

HENRY BESSEMER died in London on the evening of the 15th inst. When such a man as Bessemer dies the mining and scientific world pauses a moment to note the fact. The results of his life were of the highest practical benefit to material development. His greatest discovery—a simple, cheap conversion of pig iron into steel—made the world many thousands of millions of dollars richer. Martien in this country and Bessemer in England discovered almost simultaneously improvements in refining and converting; Mushet in England and Holley in this country succeeded in so reducing the cost and improving the output that Bessemer steel was a requisite everywhere, and the world passed from the age of iron into the age of steel, but to Bessemer is due the highest meed of praise and the immortality that accompanies such a benefactor to his race.

SOME TIME AGO the San Francisco Tool Co. of this city, in accordance with accepted plans and specifications, put in some elevators for the History Building of this city. By reason of the insufficient size of the drum one of the elevators fell, and the owners of the History Building sued for damages. On trial it was found that the specifications called for a 15-inch drum, and that the Tool Co. had exactly complied with all the requirements of the contract. Experts testified that a 30-inch drum should have been used. The judgment of the lower court was in favor of the San Francisco Tool Co. The California Supreme Court, to which the case was appealed, has confirmed the judgment of the lower court, holding that though a 30-inch drum was proved to have been necessary for the work required of the elevator, yet, as the specifications called for a 15-inch drum, and the defendants had complied with all the requirements of the specifications, they could not be held responsible for any failure of capacity—a judgment in which there will doubtless be universal agreement.

Application of Federal Mining Law.

In this issue is concluded the publication of the official compilation of the U. S. mining law, with the most recent rulings, decisions and interpretations thereof, as prepared and approved last December by the Secretary of the Interior and the Commissioner of the General Land Office. The entire volume has thus been published herein for the general information and convenience of the mining public, and a multitude of the questions weekly sent to this office can be easily and authoritatively answered by reference to this and previous consecutive issues containing the latest compilation of annotated federal mining law. Regarding section 53, which has occasioned universal comment and almost as universal protest, it is to be said that much of the fear expressed as to its disastrous retroactive effect has, fortunately, been unfounded. One subsequent circular says:

"Said paragraph 53 embodies the latest conclusions of this department as to the proper construction of section 2325, United States Revised Statutes, relative to the necessary expenditures in a case where several contiguous mining location claims are embraced in one application for patent, and it will be observed that the department decisions and circular instructions made prior to December 15, 1897, which decisions and circulars are in direct conflict with said paragraph 53, were effectually overruled by the promulgation of the paragraph last referred to.

"If A, the owner of four contiguous location claims, either lode or placer, should embrace them in one survey, your certificate as to labor and improvements should show that prior to the period of publication of the notice of application for patent, not less than $500 worth of labor had been expended or improvements made on each of the location claims by the claimant or his grantors; or that not less than $2000 worth of labor had been expended or improvements made upon one or more of the four location claims in such manner as to develop all of the location claims, and to facilitate the extraction of minerals therefrom; and in case his works and his improvements are placed on one, or two, or three of his location claims, the manner in which such labor, work or improvements tend to develop all of the location claims embraced in the survey should be made to appear by clear and satisfactory evidence, and should be fully set out in your certificate. So much of paragraph 44 of the Manual of Instructions for the survey of mineral lands as is in conflict with said paragraph 53 of the regulations is not now operative, and will not be observed."

This settled one point, viz., that instead of allowing $500 worth of work or improvements to suffice in securing a patent for a group of locations, henceforth $500 worth of such work must be shown to have been expended for each location in the specified group. On this point one inquirer wrote saying that he was interested in a group of nine claims, the chief work on which was done on two of them, and that such work could not, under the circumstances, be advantageously performed elsewhere on the property, and that, while the aggregate of work done amounted to more than $500 on each claim, yet as a matter of fact it had all been done in two places. Under date of February 18th, Assistant Commissioner Mondell said in reply:

"Applying the rule announced in paragraph 53 of the general mining circular approved December 15, 1897, to a group of nine contiguous mining claims, claimed under nine locations, and embraced in one application for patent, the applicant would be required to show, under section 2325 of the U. S. Revised Statutes and said paragraph, that not less than $500 worth of labor had been expended or improvements made upon each of the nine claims, or that $4500 had been expended upon one or more of the locations in such manner as to develop each of the nine claims, and to facilitate the extraction of minerals therefrom."

That being thus definitely settled, came up another important question: Would rule 53 be retroactive? That is, would pending applications for patent before Dec. 15, 1897, have to be republished? Would any of them be thrown out because of lack of the required amount of assessment work? In the one land office of Pueblo, Colo., more than 1000 applications on file would be affected, and so in every land office in this west half of America. On the 5th inst., in compliance with the request of this journal, Secretary of the Interior Bliss approved the recommendation of Land Commissioner Hermann to allow proof of expenditure of $500 on the consolidated claims of one or more locations under one entry filed in the past. The authorities at Washington, however, ordered that in future entries the sum must be expended on each location embraced in the consolidated entry. This, while it adhered to the requirement that $500 be expended for each location in the group for which application for patent was made, afforded relief to the thousands of applicants who feared that they would be put to additional trouble, expense and delay were rule 53 declared retroactive.

Now comes additional relief in the definite statement from the General Land Office, under date of the 14th inst., that as to all applications for mineral patent made and passed to entry before July 1, 1898, or which are by protests or adverse claims prevented from being passed to entry before that time, where the application embraces several locations held in common, proof of an expenditure of $500 upon the group will be sufficient and an expenditure of that amount need not be shown to have been made upon or for the benefit of each location embraced in the application.

This, practically, means that the old rule—allowing $500 to be sufficient for the entire group—will not be superseded by "Rule 53" until the first of next July, which effectually disposes of the multitude of fears recently expressed, and precludes possibility of regarding Rule 53 as a "snap judgment."

PROMOTERS of Alaska transportation and mining schemes seem to figure on even more than ordinary gullibility on the part of the general public. Some of the offers and inducements are more barefaced than those of '97. As usual, some of the British schemes are worse swindles than those concocted in this country, which is saying a good deal. In London papers is now being published prospectuses beside which the recent ridiculous romance in the London press, the "prospectus" of a company proposing to operate mines in Plumas Co., Cal., reads like sober truth. This later concern styles itself "a parent company," with £125,000 capital, and proposes to do anything and everything in the Klondike region from supplying "reindeer tanned-skin coats with fur sleeves" to "townsites, water lots," and bonanza placer claims on Boulder creek. Little matters like sawmills, trading stores and railway franchises are scattered in merely as seasoning. Any one buying 500 shares and making certain promises will be carried free from England to the Klondike and return, and paid £200 per year for two years. The usual array of big names head the list of "directors."

THE scant snow and rainfall of the season closing will not inure favorably to the quartz and hydraulic miners of California. The only class of miners in this State who can look upon the present situation with any degree of satisfaction are the river-bed miners. In such a season as the forthcoming months lies their best opportunity to reap a harvest. Heavy snow and usual rainfall means to them extreme hazard, a probability of losing their season's labor and money expended. River-bed mining has been carried on in this State on a scale unparalleled elsewhere. The biggest and costliest schemes of the kind have been prosecuted here, and some of the largest losses and winnings in the history of hydraulic mining enterprises resulted therefrom. "High water" is the foe of the river-bed miner. In a few hours it will wash away a patiently built and expensive plant. This comparatively dry season will largely eliminate the element of chance that necessarily enters into river-bed mining everywhere.

THE Director of the Mint has rescinded the orders directing the liquidation of entries of lead-bearing ores on the basis of his reports on the assay of samples. Portions of such samples will continue to be forwarded to the Director of the Mint, with the reports of assays made by local assayers for occasional verification. Government assayers will, whenever required, be stationed at smelting establishments for the assaying of ores transported under bond.

United States Mining Laws, and Regulations Thereunder, Relative to the Reservation, Exploration, Location, Possession, Purchase and Patenting of the Mineral Lands in the Public Domain.

NUMBER V—CONCLUDED.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That within the State of Alabama all public lands, whether mineral or otherwise, shall be subject to disposal only as agricultural lands: *Provided, however*, That all lands which have heretofore been reported to the General Land Office as containing coal and iron shall first be offered at public sale: *And provided further*, That any bona fide entry under the provisions of the homestead law of lands within said state hereto fore made may be patented without reference to an act approved May tenth, eighteen hundred and seventy-two, entitled "An Act to promote the development of the mining resources of the United States," in cases where the persons making application for such patents have in all other respects complied with the homestead law relating thereto

AN ACT providing a civil government for Alaska.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, * * *

SEC. 8. That the said district of Alaska is hereby created a land district, and a United States land office for said district is her by located at Sitka The commissioner provided for by this act to reside at Sitka shall be ex officio register of said land office, and the clerk provided for by this act shall be ex officio receiver of public moneys and the marshal provided for by this act shall be ex officio surveyor-general of said district and the laws of the United States relating to mining claims, and the rights incident thereto, shall, from and after the passage of this act, be in full force and effect in said district, under the administration thereof herein provided for, subject to such regulations as may be made by the Secretary of the Interior, approved by the President: *Provided*, That the Indians or other persons in said district shall not be disturbed in the possession of any lands actually in their use or occupation or now claimed by them but the terms under which such persons may acquire title to such lands is reserved for future legislation by Congress: *And provided further*, That parties who have located mines or mineral privileges therein under the laws of the United States applicable to the public domain, or who have occupied and improved or exercised acts of ownership over such claims, shall not be disturbed therein, but shall be allowed to perfect their title to such claims by payment as aforesaid: *And provided also*, That the land not exceeding six hundred and forty acres at any station now occupied as missionary stations among the Indian tribes in said section, with the improvements thereon erected by or for such societies, shall be continued in the occupancy of the societies or religious body to which said missionary stations respectively belong until action by Congress, but nothing contained in this act shall be construed to put in force in said district the general land laws of the United States.

* * * * * * *

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, * * *

No person who shall after the passage of this act, enter upon any of the public lands with a view to occupation, entry or settlement under any of the land laws shall be permitted to acquire title to more than three hundred and twenty acres in the aggregate, under all of said laws, but this limitation shall not operate to curtail the right of any person who has heretofore made entry or settlement on the public lands, or whose occupation, entry or settlement, is validated by this act: *Provided*, That in all patents for lands hereafter taken up under any of the land laws of the United States or on entries or claims validated by this act west of the one hundredth meridian, it shall be expressed that there is reserved from the lands in said patent described a right of way thereon for ditches or canals constructed by the authority of the United States. * * *

AN ACT To repeal timber-culture laws, and for other purposes.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, * * *

SEC. 16. That town-site entries may be made by incorporated towns and cities on the mineral lands of the United States, but no title shall be acquired by such towns or cities to any vein of gold, silver, cinnabar, copper or lead, or to any valid mining claim or possession held under existing law. When mineral veins are possessed within the limits of an incorporated town or city, and such possession is recognized by local authority or by the laws of the United States, the title to town lots shall be subject to such recognized possession and the necessary use thereof and when entry has been made or patent issued for such town sites to such incorporated town or city, the possessor of such mineral vein may enter and receive patent for such mineral vein, and the surface ground appertaining thereto: *Provided*, That no entry shall be made by such mineral-vein claimant for surface ground where the owner or occupier of the surface ground shall have had possession of the same before the inception of the title of the mineral-vein applicant.

SEC. 17. That reservoir sites located or selected and to be located and selected under the provisions of "An act making appropriations for sundry civil expenses of the Government for the fiscal year ending June thirtieth, eighteen hundred and eighty-nine, and for other purposes," and amendments thereto, shall be restricted to and shall contain only so much land as is actually necessary for the construction and maintenance of reservoirs; excluding so far as practicable lands occupied by actual settlers at the date of the location of said reservoirs and that the provisions of "An act making appropriations for sundry civil expenses of the Government for the fiscal year ending June thirtieth, eighteen hundred and ninety-one, and for other purposes," which reads as follows, viz: "no person who shall after the passage of this act enter upon any of the public lands with a view to occupation, entry or settlement under any of the land laws shall be permitted to acquire title to more than three hundred and twenty acres in the aggregate under all said laws," shall be construed to include in the maximum amount of lands the title to which is permitted to be acquired by one person only agricultural lands and not include lands entered or sought to be entered under mineral land laws.

* * * * * * *

APPOINTMENT OF DEPUTIES FOR SURVEY OF MINING CLAIMS—CHARGES FOR SURVEYS AND PUBLICATIONS—FEES OF REGISTERS AND RECEIVERS, ETC.

SEC. 2334, R. S. The surveyor-general of the United States may appoint in each land district containing mineral lands as many competent surveyors as shall apply for appointment to survey mining claims. The expenses of the survey of vein or lode claims, and the survey and subdivision of placer claims into smaller quantities than one hundred and sixty acres, together with the cost of publication of notices, shall be paid by the applicants, and they shall be at liberty to obtain the same at the most reasonable rates, and they shall also be at liberty to employ any United States deputy surveyor to make the survey. The Commissioner of the General Land Office shall also have power to establish the maximum charges for surveys and publication of notices under this chapter; and, in case of excessive charges for publication, he may designate any newspaper published in a land district where mines are situated for the publication of mining notices in such district, and fix the rates to be charged by such papers; and, to the end that the Commissioner may be fully informed on the subject, each applicant shall file with the register a sworn statement of all charges and fees paid by such applicant for publication and surveys, together with all fees and money paid the register and receiver of the land office, which statement shall be transmitted, with the other papers in the case, to the Commissioner of the General Land Office.

91. Under this authority of law the following rates have been established as the maximum charges for newspaper publications in mining cases:

(1) Where a daily newspaper is designated the charge shall not exceed seven dollars for each ten lines of space occupied, and where a weekly newspaper is designated as the medium of publication five dollars for the same space will be allowed. Such charge shall be accepted as full payment for publication in each issue of the newspaper for the entire period required by law.

It is expected that these notices shall not be so abbreviated as to curtail the description essential to a perfect notice, and the said rates established upon the understanding that they are to be in the usual body type used for advertisements.

(2) For the publication of citations in contests or hearings involving the character of lands the charges shall not exceed eight dollars for five publications in weekly newspapers or ten dollars for publications in daily newspapers for thirty days.

92. The surveyors-general of the several districts will, in pursuance of said law, appoint in each land district as many *competent* deputies for the survey of mining claims as may seek such appointment, it being distinctly understood that all expenses of these notices and surveys are to be borne by the mining claimants and not by the United States. The claimant may employ *any* deputy surveyor within such district to do his work in the field. Each deputy mineral surveyor before entering upon the duties of his office or appointment shall be required to enter into such bond for the faithful performance of his duties as may be prescribed by the regulations of the Land Department in force at that time.

93. With regard to the *platting* of the claim and other *office work* in the surveyor-general's office, that officer will make an estimate of the cost thereof, which amount the claimant will deposit with any assistant United States treasurer or designated depository in favor of the United States Treasurer, to be passed to the credit of the fund created by "individual depositors for surveys of the public lands," and file with the surveyor-general duplicate certificates of such deposit in the usual manner.

94. The surveyors-general will endeavor to appoint mineral deputy surveyors, so that one or more may be located in each mining district for the greater convenience of miners.

95. The usual oaths will be required of these deputies and their assistants as to the correctness of each survey executed by them.

The duty of the deputy mineral surveyor ceases when he has executed the survey and returned the field notes and preliminary plat thereof with his report to the surveyor-general. He will not be allowed to prepare for the mining claimant the papers in support of an application for patent or otherwise perform the duties of an attorney before the land office in connection with a mining claim.

The surveyors-general and local land officers are expected to report any infringement of this regulation to this office.

96. Should it appear that excessive or exorbitant charges have been made by any surveyor or any publisher, prompt action will be taken with the view of correcting the abuse.

97. The fees payable to the register and receiver for filing and acting upon applications for mineral-land patents are five dollars to each officer, to be paid by the applicant for patent at the time of filing, and the like sum of five dollars is payable to each officer by an adverse claimant at the time of filing his adverse claim. (Sec. 2238, R. S,, paragraph 9.)

98. At the time of payment of fee for mining application or adverse claim the receiver will issue his receipt therefor in duplicate, one to be given the applicant or adverse claimant, as the case may be, and one to be forwarded to the Commissioner of the General Land Office *on the day of issue*. The receipt for mining application should have attached the certificate of the register that the lands included in the application are vacant lands subject to such appropriation.

99. The register and receiver will, at the close of each month, forward to this office an abstract of mining applications filed, and a register of receipts, accompanied with an abstract of mineral lands sold, and an abstract of adverse claims filed.

100. The fees and purchase money received by registers and receivers must be placed to the credit of the United States in the receiver's monthly and quarterly account, charging up in the disbursing account the sums to which the register and receiver may be respectively entitled as fees and commissions, with limitations in regard to the legal maximum.

HEARINGS TO DETERMINE CHARACTER OF LANDS.

101. The Rules of Practice in cases before the United States district land offices, the General Land Office, and the Department of the Interior will, so far as applicable, govern in all cases and proceedings arising in contests and hearings to determine the mineral character of lands.

102. No public land shall be withheld from entry as agricultural land on account of its mineral character except such as is returned by the surveyor-general as mineral; and the presumption arising from such a return may be overcome by testimony taken in the manner hereinafter described.

103. Hearings to determine the character of lands are practically of two kinds, as follows:

(1) Lands returned as mineral by the surveyor-general.

When such lands are sought to be entered as agricultural under laws which require the submission of final proof after due notice by publication and posting, the filing of the proper nonmineral affidavit in the absence of allegations that the land is mineral will be deemed sufficient as a preliminary requirement. A satisfactory showing as to character of land must be made when final proof is submitted.

In case of application to enter, locate, or select such lands as agricultural, under laws in which the submission of final proof after due publication and posting is *not* required, notice thereof must first be given by publication for sixty days and posting in the local office during the same period, and affirmative proof as to the character of the land submitted. In the absence of allegations that the land is mineral, and upon compliance with this requirement, the entry, location, or selection will be allowed, if otherwise regular.

(2) Lands returned as agricultural and alleged to be mineral in character.

Where as against the claimed right to enter such lands as agricultural it is alleged that the same are mineral, or are applied for as mineral lands, the proceedings in this class of cases will be in the nature of a contest, and the practice will be governed by the rules in force in contest cases.

RAILROAD AND STATE SELECTIONS.

104. Where a railroad company seeks to select lands not returned as mineral, but within six miles of any mining location, claim, or entry, or where in the case of a selection by a State, the lands sought to be selected are within a township in which there is a mining location, claim, or entry, publication must be made of the lands selected at the expense of the railroad company or State for a period of sixty days, with posting for the same period in the land office for the district in which the lands are situated, during which period of publication the local land officers will receive protests or contests for any of said tracts or subdivisions of lands claimed to be more valuable for mining than for agricultural purposes.

105. At the expiration of the period of publication the register and receiver will forward to the Commissioner of the General Land Office the published list, noting thereon any protests, or contests, or suggestions as to the mineral character of any such lands, together with any information they may have received as to the mineral character of any of the lands mentioned in said list, when a hearing may be ordered.

106. At the hearings under either of the aforesaid classes, the claimants and witnesses will be thoroughly examined with regard to the character of the land; whether the same has been thoroughly prospected; whether or not there exists within the tract or tracts claimed any lode or vein of quartz or other rock in place, bearing gold, silver, cinnabar, lead, tin or copper, or other valuable deposit which has ever been claimed, located, recorded, or worked; whether such work is entirely abandoned, or whether occasionally resumed; if such lode does exist, by whom claimed, under what designation, and in which subdivision of the land it lies; whether any placer mine or mines exist upon the land; if so, what is the character thereof—whether of the shallow-surface description, or of the deep cement, blue lead, or gravel deposits; to what extent mining is carried on when water can be obtained, and what the facilities are for obtaining water for mining purposes; upon what particular ten-acre subdivisions mining has been done, and at what time the land was abandoned for mining purposes, if abandoned at all.

107. The testimony should also show the agricultural capacities of the land, what kind of crops are raised thereon, and the value thereof; the number of acres actually cultivated for crops of cereals or vegetables, and within which particular ten-acre subdivision such crops are raised; also which of these subdivisions embrace the improvements, giving in detail the extent and value of the improvements, such as house, barn, vineyard, orchard, fencing, etc., and mining improvements.

108. The testimony should be as full and complete as possible; and in addition to the leading points indicated above, where an attempt is made to prove the mineral character of lands which have been entered under the agricultural laws, it should show at what date, if at all, valuable deposits of mineral were first known to exist on the lands.

109. When the case comes before this office such decision will be made as the law and the facts may justify; in cases where a survey is necessary to set apart the mineral from the agricultural land, the proper party *at his own expense* will be required to have the work done, at his option, either by United States deputy, county, or other local surveyor; application therefor must be made to the register and receiver, accompanied by a description of the land to be segregated, and the evidence of service upon the opposite party of notice of his intention to have such segregation made; the register and receiver will forward the same to this office, when the necessary instructions for the survey will be given. The survey in such case, where the claims to be segregated are vein or lode claims, must be executed in such manner as will conform to the requirements in section 2320, United States Revised Statutes, as to length and width and parallel end lines.

110. Such survey when executed must be properly sworn to by a surveyor, either before a notary public, officer of a court of record, or before the register or receiver, the deponent's character and credibility to be properly certified to by the officer administering the oath.

111. Upon the filing of the plat and field notes of such survey with the register and receiver, duly sworn to as aforesaid, they will transmit the same to the surveyor-general for his verification and approval; who, if he finds the work correctly performed, will properly mark out the same upon the original township plat in his office, and furnish authenticated copies of such plat and description both to the proper local land office and to this office, to be affixed to the duplicate and triplicate township plats respectively.

112. With the copy of plat and description furnished the local office and this office, must be a diagram tracing, verified by the surveyor-general, showing the claim or claims segregated, and designating the separate fractional agricultural tracts in each 40-acre legal subdivision by the proper lot number, beginning with No. 1 in each section, and giving the area in each lot, the same as provided in paragraph 45, in the survey of mining claims on surveyed lands.

113. The fact that a certain tract of land is decided upon testimony to be mineral in character is by no means equivalent to an award of the land to a miner. In order to secure a patent for such land he must proceed as in other cases, in accordance with the foregoing regulations.

Blank forms for proofs in mineral cases are not furnished by the General Land Office.

MINERAL ENTRIES WITHIN FOREST RESERVES.

The following is an extract from circular entitled Rules and Regulations governing Forest Reservations, established under section 24 of the act of March 3, 1891 (26 Stat. L., 1095). Approved June 30, 1897. (24 L. D., 589-593-594.)

LOCATION AND ENTRY OF MINERAL LANDS.

19. The law provides that "any mineral lands in any forest reservation which have been or which may be shown to be such, and subject to entry under the existing mining laws of the United States and the rules and regulations applying thereto, shall continue to be subject to such location and entry," notwithstanding the reservation. This makes mineral lands in the forest reserves subject to location and entry under the general mining laws in the usual manner.

20. Owners of valid mining locations made and held in good faith under the mining laws of the United States and the regulations thereunder are authorized and permitted to fell and remove from such mining claims any timber growing thereon, for actual mining purposes in connection with the particular claim from which the timber is felled or removed. (For further use of timber by miners see below, under heading "Free use of timber and stone.")

FREE USE OF TIMBER AND STONE.

21. The law provides that "The Secretary of the Interior may permit, under regulations to be prescribed by him, the use of timber and stone found upon such reservations, free of charge, by bona fide settlers, miners, residents, and prospectors for minerals, for firewood, fencing, buildings, mining, prospecting, and other domestic purposes, as may be needed by such persons for such purposes; such timber to be used within the State or Territory, respectively, where such reservations may be located.

This provision is limited to persons resident in forest reservations who have not a sufficient supply of timber or stone on their own claims or lands for the purposes enumerated, or for necessary use in developing the mineral or other natural resources of the lands owned or occupied by them. Such persons, therefore, are permitted to take timber and stone from public lands in the forest reservations under the terms of the law above quoted, strictly for their individual use on their own claims or lands owned or occupied by them, but not for sale or disposal, or use on other lands, or by other persons: *Provided*, That where the stumpage value exceeds one hundred dollars, application must be made to and permission given by the Department.

BINGER HERMANN,
Commissioner.

Approved December 15, 1897.

C. N. BLISS,
Secretary.

River Mining in California.

From various sections of the country have been received inquiries regarding wingdams and fluming, and in the issue of the 5th inst. appeared an article on "Wingdams" by Mr. R. L. Dunn. Continued inquiry on the same points occasions the belief that a portion of a more extended article on the same subjects, written by the same gentleman and which has heretofore not appeared in any journal, may be of general benefit. The probability of low water in every California stream this season makes it likely that unusual attention will be given river mining in this State in '98, making the entire subject one of added present interest.

River mining is a branch of placer mining that is carried on in the channels and beds of rivers and large streams. Practically, it may be considered as including the mining of such deep bars as have to be exploited below the surface of the water in the adjacent river. River mining is not local to California, though undoubtedly carried on to a greater extent here than in any other gold-bearing district in the world. As contrasted with gulch and ravine mining and hydraulic mining, it is dry season work, only practicable when the rivers are in their low water stages, as probably they will be this season. Probably no other branch of our gold mining industry is subject to more uncertainty under ordinary conditions than is river mining, yet in no other branch are as large returns possible with comparatively small capital. In the early mining history of California, after the rapid working out of the shallow placers of the high bars, attention was turned to the river channels as the next most certain source for a large gold yield, and in 1852, 1853 and 1854 a very large amount of this mining was done, and most of the gold yield of the State at that time came from this source. During these years all of the large gold-bearing rivers in the State were worked, but the industry gradually declined in relative importance with the discovery and opening of the mines in the old river channels. Hydraulic mining from 1857–8 practically extinguished river mining in many of the rivers by reason of tailings covering up the river claims, and it is only since 1880, coincident with the restriction of hydraulic mining, that the attention of mining men has been directed to the river channels.

The rivers in which river mining is carried on run in narrow canyons more or less difficult of access. Usually the hill and mountain slopes rise directly from the water's edge, but the streams meander for portions of their course from side to side of narrow valleys, leaving small flats, or "bars," as they are termed by the miners, alternately on one and the other side of the stream. The formation of these bars is due to the action of the flowing river. During the period of its gradual erosion, slides from the hillsides, or the accumulating debris of floods, have changed the course and channel of the streams and widened the canyons to narrow valleys. These bars, sometimes high above the present channel of the river, sometimes lower than it, are nothing but portions of its former bed. Often a secondary erosion so changes them that their identity is lost; but wherever they are, the dynamic and hydraulic forces that formed them made them natural riffles and storehouses of placer gold. These deep bars were the dream and the snare of the early miners, probably more effort and capital being expended in unsuccessful attempts to mine them than in any other of the early mining operations, the fabulous yield of the few successfully worked deep bars and adjacent river-bed encouraging similar undertakings that were only abandoned after successive failure had demonstrated the inadequacy of the appliances and methods employed.

River mining is almost entirely a problem of restraining and handling large volumes of water. In the rivers it involves dams and pumps to control the water, so that the bed of the river can be exposed and mined. In deep bar mining the river waters also require control and must be drained away and their influx prevented, and it is this similarity of condition that makes it desirable to consider both under the general term "river mining," though the appliances employed for the latter are of a more permanent character and involve the outlay of more capital than is required for the former.

The season during which river mining is possible begins with the receding of the flood waters in spring and continues until the first rains in the fall raise the waters again. Sometimes this first rise does not destroy the mining plant in the river-bed, and a period of low water following lengthens the season till the winter storms come. The season is therefore an uncertain quantity, varying from year to year, and different in different streams. On the Klamath river and its tributaries the season is given as eight months, beginning about the middle of March or the first of April and ending about the first of December. On the Middle Fork of the American it begins about the first of May and continues till the first of November, usually, though sometimes shuts down as early as October, and sometimes not till the end of December. In the Feather river the season is even shorter, it not ordinarily being practicable—on account of the large water flow—to begin operations before the middle of May nor to continue them after the first of November. The time that can be given to actual mining and taking out of gold is, however, only a comparatively short part of this season. From the nature of the appliances required and their location in the river-bed, they have to be put in anew for every season's work, and frequently the work of fitting up leaves only a few days for mining before the rising waters sweep away in a few hours the work of months. Ten, twenty or thirty days is not uncommon as the time employed in actual mining, but yields of from $500 to $5000 a day for this time are often realized, repaying well the labor and expenditure of fitting up.

River mining, considered with reference to appliances for working, can be considered under subdivisions, as follows:

1. River mining by temporary wingdams, an upper and a lower cross-dam and a connecting dam in and aligning with the stream, reclaiming a portion of the river-bed for mining, and forcing the water flow to the opposite side of the channel without raising the level of its flow materially.
2. "Fluming" or river mining with two temporary cross-dams and a temporary flume laid as near the low water level of the stream as practicable, into which the entire flow is diverted by the upper dam and conducted over the lower. By this method the water level behind the upper dam is only raised from three to four feet.
3. River mining with an upper dam raising the water level above the ordinary high water line, diverting the entire flow into a flume or tunnel of permanent character. The upper dam may or may not be designed to be permanent.
4. River mining through permanent shafts, hoisting and pumping plant on the banks of the stream and mining by drifting under the channel.
5. River mining by elevators, dredges, vacuum pumps and all similar plants, placed usually on a barge or float, and working underneath the surface of the water.
6. Deep bar mining by shafts and drifts.
7. Deep bar mining by stripping and "pitting," employing either steam or hydraulic lifts or elevators.

Wingdams.—River mining by wingdams is the usual method where the volume of water is too great to be flumed. At the present time it is the method exclusively employed on the Klamath river. Considerable of the old mining on the Feather, Yuba and American rivers was done by the construction of such dams, but they are seldom seen there now, except where small companies of Chinese are at work.

The wingdams made for mining are temporary structures, made usually at a cost only of the labor employed. For the "head" (upstream) dam the upper end of a riffle is selected, if possible, and two parallel walls of bowlders are built, not less than six feet apart, and the space between filled in with gravel and sand, the former nearest the outer wall, as sand would gradually wash through the spaces of the bowlder wall and the dam would not be tight. When these walls reach about the middle of the stream, or as far out as it is desirable to mine, they are turned down stream and continued to the lower limit of the ground to be inclosed, then turned, on a riffle if possible, and the "tail" (down stream) dam built, connecting with the same side of the river from which the head dam sets out. Considerable care is required in filling between the walls, in order to make a tight dam. The mining ground thus being walled in, its drainage is then effected by what is commonly known among miners as a Chinese pump, located at the lower end of the mining ground or in its deepest hole. The motive power for this pump is the current of the stream. An undershot water-wheel is built and placed in the stream alongside of the dam, so that the current impinges directly against the paddles. The pillow blocks on which the shaft rests are made of piles driven in the bottom of the river and buttressed by as large bowlders as can be placed against them. The pillow blocks are not fast, but work in vertical slides and can be raised or lowered by levers, so as to control the running of the wheel. If necessary, another wingdam is built out from the other side of the river to turn the force of the current still more against the wheel. This wheel being very liable to be swept away and lost when high water comes, is constructed as simply and cheaply as possible. For the shaft a twelve-inch square timber is used, the ends rounded and protected with iron rings, into which the gudgeons of the two or two and one-half inch cast journals are driven. The diameter of the wheel is usually ten or twelve feet and the width, dependent on the work it has to do, from eight to eighteen feet. The arms are made of 2x4 scantling, sometimes mortised into the shaft, but preferably spiked to flanges made of doubled inch boards from sixteen to twenty inches deep. Three or four sets of twelve arms each are placed on the shaft, this depending on the width of the wheel, and paddles made of inch lumber and twelve inches wide dip into the current. The journals turn in seasoned oak boxes resting on the pillow blocks. A wheel so constructed can be broken to pieces quite rapidly, and the shaft—the valuable part—saved for another season's work when it would not be possible to save the wheel entire. Between the wheel and the pier on the side toward the dam is the gear connecting with the counter shaft, usually a rubber or leather belt running on a wooden drum three feet in diameter and with a twelve to twenty-four inch face, which runs the pump. The pump is simply an inclined box made of one or one and one-half inch lumber and from sixteen to thirty-six feet long. Attached in it at the bottom and under the water is another drum not as large as that on the counter shaft. Over these two drums and through the pump box or barrel runs a tight rubber or canvas belt from twelve to twenty-four inches wide, dependent somewhat on the quantity of water that must be handled, and specially prepared, if the latter material is used, to resist rotting and the grit of the water. On the outer side of this belt, three feet apart, are fastened paddles three to six inches wide and of length equal to the width of the belt. The belt and these paddles just fill the pump box, the lower end of which being open under the water surface and the upper end opening into the discharge flume or box, a continuous stream of water of large volume is pumped or elevated. For lifts of from twelve to twenty feet this style of pump is very effective, and water is frequently elevated thirty feet by means of them. Some of the larger of these pumps handle fifty inches of water. With one or more of them to clear and to keep clear the area inside of the wingdams, the ground is ready for mining. The only appliance required for this other than picks, shovels, wheelbarrows and sluice-boxes is a derrick. This consists of a stout mast sixty to one hundred feet high with a boom guyed with six wire ropes. It has the usual blocks, tackle and windlass, and its utility is in handling large bowlders, clearing away waste for the pit and in lifting gravel to the sluices, though this last is more often done with one or more lifts of shoveling or by wheelbarrows. Where much work is done with the derrick, it may be operated by a small current wheel similar to that already described. For the washing of the pay gravel a small stream of water is let in through the head dam. Should it not be possible to get sufficient grade for the sluices and their discharge over the tail dam, what is termed a dip wheel is used to raise the necessary water. This is a wheel run by the current, but of larger diameter, twenty to twenty-six feet, and less width, four to eight feet, than the wheel used for pumping. On one or both ends on the periphery are buckets that, with the revolution of the wheel, dip up water and discharge it into the washing sluices.

The gravel containing gold is almost invariably right on the bedrock and in its crevices. The depth of the pay varies, sometimes being fifteen or twenty feet and sometimes only a few inches. Overlying the pay is a mass of bowlders and gravel, containing little or no gold, which is removed by the derrick or barrows till a pit is excavated down to the pay gravel. This is then taken out down to the bedrock and washed, the bedrock being carefully creviced and cleaned. The area of the cleaned bedrock is then utilized to pile bowlders and as a dump for the stripping of fresh ground. The general experience of river miners has been that the riffles contained the pay gravel, while the deep holes were comparatively barren of gold. Crevices in the bedrock are often wonderfully rich.

The shortness of the season available for work compels the use of the nights as well as the days. When the ground inside of the dams is worked out, or the rising water stops work for the season, the claim is dismantled and as much as possible of the plant saved. The derrick is first secured, then the pumps, belts, wheels and sluice-boxes.

The cost of fitting up a claim with wingdams, wheels, pumps, derricks and sluices, and the excavation of the pit to pay gravel, is sometimes as low as $500, occasionally as much as $5000, and a safe average of experience places it anywhere from $2500 to $5000.

Fluming.—Fluming, or river mining with head and tail dams across the entire width of channel of the stream, and the diversion of the latter into a flume, is a more expensive and uncertain operation than mining by wingdams, yet much better suited to extensive operations than the other. Where it is possible to mine portions of the bed of almost any stream by means of wingdams, fluming can only successfully be done in the smaller rivers. In the fifties, when river mining was at the extreme height of its importance and prosperity, combinations of several companies of miners working adjacent claims frequently flumed the smaller rivers for miles and worked every foot of the channel.

The season for flume mining is shorter than that for wingdam work. This is occasioned by the necessity of constructing the flume first; and as the flume cannot be built under water, it is necessary to wait till the river is close to its low-water stage before beginning construction. The water in the Feather and American rivers is usually low enough to begin the construction of a fluming plant between the 1st and 15th of June, though some years it is possible to commence as early as the first of May.

The flume is built on one or the other side of the river as is most convenient, right in the water, in

order to have it as low as possible. The dimensions are dependent on the volume of water it is expected to carry. On the North and Middle Forks of the American river, above the junction, from eight to twelve feet was the usual width; below the junction in the North Fork eighteen and twenty feet width was found necessary. In the Feather river at different points twenty-four to thirty-two feet is required, and in Bear river four to six feet was found ample. The depth of the boxes varies from three to five feet. The grade given should not be less than three inches to one hundred feet, a rapid flow being desirable to give the necessary power for current wheels and to lighten the weight on the flumes by keeping the depth of flow low. The whole construction is of the most temporary character. Stringers 10x12 or 6x10, rough pine logs smoothed by the ax, are laid about four or four and one-half feet apart and posted up where necessary; on the stringers are laid the sills or cross-ties, 4x4 scantling, three feet apart. The uprights of scantling are cut round at the foot and driven into two-inch auger holes in the ties; the wider flumes are braced from the ends of the cross-ties and the narrower by strips nailed on the tops of the uprights. The bottom and sides are made of inch boards. Experience has found such a flume able to carry water five feet deep without showing any evidences of weakness or giving way. The head and tail of the flume require the most care and attention as regards construction, owing to the danger of leaking or of undercuttings. At the head the flume is flared out with a gradual taper to nearly double the regular width and projects beyond the line of the head dam from nine to twelve feet, the third or fourth cross-tie being brought into exact line with the stringers or plate on the inclined frames of the dam. Before the flume is floored boards are driven down from this tie to the bottom of the stream on the slope of the planking of the dam, so that the jointing with it will be tight. Large rocks, gravel and finally sand are immediately thrown in on the foot of these inclined planks to keep the current from undercutting, and the entire space in front of them to the head of the flume is then filled up solid with rocks and gravel before the floor is laid. At the tail end of the flume, in the line of the tail dam, before the floor is laid, two lines of planks are driven down vertically from two of the cross-ties, six feet apart, and the space between filled up with bowlders and gravel and made a part of the dam.

As soon as the flume is built the construction of the head dam is made. This is a timber dam; but, being temporary, and only calculated to sustain the pressure of from two to four feet of water, it is constructed of the cheapest and most accessible materials as far as possible. The pines on the adjacent canyon slopes furnish the timbers. These are roughly squared and faced with the ax. For the location of the dam the upper end of a riffle is preferable. Frames or bents are first made of timbers eight to twelve inches square. These bents are triangular, and consist of a mud-sill ten to eighteen feet long, to which, at one end, the inclined sill or stringer plate is trenailed with a two-inch trenail, the angle between the two timbers being made from 30° to 45°, the frame being then completed by a brace timber set at right angles with the inclined sill and footed into the mud-sill, and fastened to both by two-inch trenails. For large frames a second brace is put in. Boards are spiked each side of this frame above the mud-sill, making a box, which is filled with bowlders, and enables the frame to be floated upright into place. The placing of the frames, which are set from eight to sixteen feet apart, dependent on the depth of water and force of the current they are set in, is commenced at the head of the flume, care being taken to secure a perfect alignment in order that the bearing of the stringers and planking shall be evenly distributed. If the current is not too strong the frame can be put in place by two or three men on each side of a frame, otherwise two ropes are fastened to the nose of the frame and the frame snubbed into place from the river banks. The bed of the river on which the mud-sill is seated is smoothed off with a crowbar, the frame weighted into place with bowlders and temporarily tied to the other frames with strips until all the frames are in place. On the inclined slope of the frames stringers are laid. These are timbers as long as they can be cut and from eight to twelve inches through between the ax-smoothed sides. These are laid on the inclined sills above the water's surface and forced below it as near to the bottom as possible, the pressure of the current keeping them in place without further fastening. A second stringer is then laid on the frames about four or four and one-half feet above the first, which will bring it at the surface of the water usually, and then a third an equal distance above the second. The dam is then planked with inch boards twelve to sixteen feet long, according to the depth of the stream, the planking commencing at the flume and going toward the opposite side of the stream. An expert can push a plank down, edge to the current, until bottom is reached, when it is turned and forced into place with the current, or the boards can be slid down the stringers to the bottom, no fastening being required to keep them in place. As the laying of the planking progresses, large bowlders and gravel are dumped at its foot from a temporary staging to prevent the current undercutting; and as soon as the planking is completed, bowlders, gravel, sand and earth are wheeled in and dumped against the planking until the dam is tight and all the water flows through the flume. The tail or foot dam is then constructed, on the lower end of a riffle preferably. Two walls are built of bowlders and large rocks, not less than six feet apart, and filled in between with sand and gravel, the construction being similar to that of wingdams as already described. A tail dam is not always essential, as a riffle may protect the pit against back water. With the completion of the tail dam the pit is ready to be cleared of water. One or more undershot waterwheels are set up in the flume and driven by the current. These furnish power for the Chinese pumps, derrick and, if used, the electric light plant for working the claim at night. The opening of the ground by pits and the mining out and washing of the gravel has been already described in connection with the method of river mining with wingdams. The ground is mined out underneath the flume and head dam by putting in posts as fast as the support of the ground is cut away. A slight rise of the stream does not necessarily close down mining by wingdams, as the portion of the channel occupied by the water flow is so large that it may carry the additional water of the rise without overtopping the dams; but, in fluming, a slight rise may overtax the capacity of the flume and fill the pit. In fluming, the material put into the dam is almost certainly an entire loss at the end of each season; also, it is not expected that any of the flume will be saved. With good luck, the wheels, pumps, derricks and lighter plant may be taken out of the river and saved over from one season until the next.

NORTH BLOOMFIELD MINE, NEVADA CO., CAL.—(See page 309.)

FRENCH CORRAL MINE, NEVADA CO., CAL.—(See page 309.)

The cost of fitting up a fluming claim from year to year cannot be given with even approximate accuracy, as unforeseen contingencies enter largely into it with every different claim and in different years with the same claim. It is safe to say, however, that this expense—except in very small operations—will not be less than $3000 and may be $10,000.

River Mining.—Concerning the general proposition of river mining, it is subject to great uncertainty in the matter of ascertaining whether or not the particular ground it is proposed to exploit has ever been worked or not. Purely surface indications cannot be depended on, and the period of general activity in this branch of mining is now so long past that there is little or no reliable information possible from residents of the locality. But though the river beds may have been worked over once years since, the tailings from hydraulic and drift mines have replaced much of the gold that had been taken out. By means of elevators and large heads of water, it will prove profitable to work over these tailings in many of the larger rivers. Again, the winter flood waters are constantly working these tailings down stream and with them considerable amounts of fine gold. It would not, I think, prove unprofitable to put undercurrents in the rivers at points where they can be protected from washing out. The yield, of course, is not large, but neither is the expense connected with this kind of plant. Another method of work which is economical is the construction of a bedrock cut, paved with riffles, through which the great volume of the river and tailings are carried by the winter floods, the sluice being cleaned up in low water. This last described method of mining is rather more applicable to the smaller rivers and canyons where there is a high grade than to the large, wide rivers, but is sometimes of assistance in the latter in cleaning off the top ground of a pit.

The Arizona School of Mines.

TO THE EDITOR:—In the interest of mines and mining (in a legitimate way) I believe we, one and all, are agreed on that proposition; but when an institution steps in, claiming to be endowed by a Territory and is using United States funds to pay its professors, it is time for the general mining public to inquire into the disinterestedness of certain parties in fostering mining.

When Prof. Wm. P. Blake was made professor of school of mines, he was given the special privilege of experting mines; his salary is paid out of the agricultural college funds.

Enclosed I send you a copy of the last A. T. Assembly act, No. 68, creating a commercial assay office. The former act created a school of mines. Does this act, No. 68, repeal the former and convert the school of mines into a commercial assay office?

Enclosed you will find a scheduled rate of assaying and working of ores, and Prof. Wm. P. Blake's directors' published report in this Tuesday's (Feb. 8th) issue of the *Morning Star*. Ex-Gov. E. C. Hughes is president of the so-called University of Arizona board of trustees.

This report may be of interest to the general mining public of the United States.

In examining into the report of the professor we find that the total receipts for nine months of 1897 were $1064.15, out of which the assayer, Mr. Jacobs, receives $100 per month, and one of the university students is paid $25 per month for crushing the ore samples.

Assay material and coke are charged to the office, and, also, for and in consideration of the increased business, a new building of three rooms, costing $1100, has just been completed, together with the former appurtenances, such as laboratory, mill, concentrator and sampling works, were erected largely with funds furnished by the United States for an agricultural college.

All of these funds were converted and used for the purpose of carrying on a mining bureau for the benefit of ———, and mines placed on the New York and other markets for speculation.

E. L. WETMORE.

Tucson, Arizona.

There seems to be considerable difference of opinion in Arizona on this subject, which opinion naturally largely depends upon the point of view, as in all such cases. An assayer doing business in Arizona would doubtless consider bill No. 68 an unwarranted infringement on his interests, placing him in competition with the Territory. The miner or prospector in Arizona, in whose interests bill No. 68 was presumably made, might entertain a different view. These things must work themselves out; though it is to be said in other communities where the same action as that of the Arizona Legislature was taken, the ultimate results were not mutually satisfactory.

LESS than twenty years ago a veteran lumberman was heard to laugh at the idea of making paper from poplar and spruce wood. He claimed it was impossible. Now the wood-pulp industry consumes more than half of all the spruce cut in this country. That skeptic belongs to the class of men who scorned the idea of ocean steam navigation. One very learned man, Dr. Lardner, in a lecture delivered at Liverpool, said: "As to the project which is announced in the newspapers of making a voyage directly from New York to Liverpool, it is, I have no hesitation in saying, perfectly chimerical, and they may as well talk of making a voyage from New York or Liverpool to the moon." The skepticism of that age was great. The chief naval architect of one of England's dockyards said to Scott Russell: "Don't talk to me about iron ships—it is contrary to Nature." Fortunately the knowledge of the world is not all locked up in the brain boxes of a few men.

Gold Deposits, Geology and Geography of Alaska.

The MINING AND SCIENTIFIC PRESS has published a mass of authentic information about Alaska, the Yukon and the Klondike region. Much of this was original, being high-priced articles by specialists: a portion of it was selected from the best sources, chiefly recent government reports and accounts of well-posted miners.

The U. S. Government has just issued another pamphlet on that region prepared by W. H. Dall and F. C. Schrader, and personally edited by S. F. Emmons of the U. S. Geological Survey. In the pamphlet is much that is of present interest. Prof. Emmons says:

In mining for gold man reverses the order of the natural processes which have produced such concentrations of this and other metals in the earth's crust as can be worked by him at a profit. In the solid rocks the useful metals were first concentrated in interstitial spaces, generally cracks or fissures, where they filled the vacant spaces and sometimes impregnated or replaced to a certain extent the adjoining rock. Such concentrations constitute original ore deposits. In these the metallic minerals are generally accompanied by some earthy minerals; and as, in the case of gold deposits, this earthy mineral is nearly always quartz and the most commonplace of deposit is a vein or fissure, the term "quartz vein" has come to be almost universally used among mining men to designate original deposits of gold-bearing ores, even when the spaces filled were not strictly fissure veins. This generic use of the term "quartz vein" will be followed in the succeeding pages.

In the ordinary processes of nature, after rocks have been formed and consolidated, they are folded, crushed and lifted up into mountain ranges, and then worn down and disintegrated by cold, heat, rain and other destructive agencies, and finally transported by running water and rearranged and distributed in river valleys or on beaches. During this transportation and rearrangement the heavy particles in the detrital material, or gravels, naturally settle to the bottom in the valleys or on the beaches; hence, where these detrital materials come from the wearing down of rocks containing gold deposits, there results a concentration of the gold at favorable points, and a later class of deposit is formed, which is called by the generic name "placer."

In placer deposits, where nature has already done part of the work of separating the gold from its matrix, man finds the readiest remuneration for his labor, but in searching for deposits of this character he must be guided by such knowledge as is attainable with regard to the source of the concentrated gold. Although very finely divided gold may be transported long distances in the sands of large rivers and may settle in considerable quantities at favorable localities, the coarser gold, which yields the greatest remuneration, is rarely carried far, hence the richest deposits must be sought near the source of the gold. In the following statement of what is known with regard to the economic resources of Alaska, therefore, there will first be given such ideas as may be deduced from the incomplete observations that have been made in this vast region with regard to its geological structure and the probable position and extent of the rocks containing the original deposits of gold, and then a description of its various forms of placer deposits.

Alaska may be divided topographically into a coastal and an interior region. The international boundary between American and Canadian territory has no relation to the physical structure of the region; hence, in this description, that portion of British Columbia which lies opposite the Alexander Archipelago and the coastal strip of American territory southeast of Mount St. Elias will be considered as part of the general province of Alaska. The known portions of the interior region, which lie mainly south of the Arctic circle, belong to the drainage system of the Yukon river. This stream with its various tributaries drains the northwestern portion of the Cordilleran system included between the coast and the Mackenzie River valley, which are about 700 miles apart and approximately parallel. The Mackenzie river flows from Great Slave lake into the Arctic ocean. The Yukon has a general northwest course for about 700 miles (neglecting curves), and then, at its junction with the Porcupine, bends abruptly to the southwest, reaching Behring sea at a distance of about 650 miles in a straight line from the bend. Its earlier or northwest course, which is also that of many of its principal tributaries, is evidently dependent upon the older features of the mountain structure, but the change to a direction transverse to this may have been determined in a comparatively recent geological period. To one tracing the broader features of physical structure northwestward from the United States through British Columbia, it would seem that the mountainous region between the Yukon and the Mackenzie represents the Rocky mountains proper, and the Alexander Archipelago and adjoining coast slopes the Coast Ranges. The basin of the Upper Yukon (the river above the great bend) would then be the representative of the Great Basin region in the United States, since north of the 49th parallel the uplift of the Sierra Nevada has merged with that of the Coast Ranges into one general system.

The Yukon river is characterized by a great volume of water, which carries with it large quantities of detrital material that in the lower reaches forms considerable bars and islands. Its valleys are alternately very broad and very narrow. The broad stretches often contain modern lakes, or, as the stratified gravels on the sides show, occupy ancient lake basins, now drained; in the narrow stretches the river is frequently confined within vertical canyon walls, in which it is sometimes cutting through transverse mountain ranges, sometimes through fields of lava, generally basaltic, that have spread across its track. The greatest of the open valleys is known as the Yukon Flats, which includes the region of the great bend, commencing near Circle City. Much of the Lower Yukon runs also through more or less open valleys, low tablelands or mesa regions, whose surface is occupied by nearly horizontal beds of Tertiary or even more recent age. At places it cuts down through these and exposes older rocks, forming parts of partially submerged mountain ranges, as the so-called Lower Ramparts.

Little is known of the structure of the coastal region beyond the immediate coast line except the narrow strip of territory known as southeastern Alaska. The mountainous islands of the Alexander Archipelago are supposed to constitute part of the range which culminates in Mount St. Elias and beyond splits into two ranges, one trending westward with the bend of the coast, the other continuing in a northwesterly direction and probably forming the southern watershed of the Tanana river. The Coast Range proper is a broad elevated belt with many scattered peaks, but not differentiated into continuous ranges. Oceanward it presents an abrupt, rugged front, cut by fiord-like valleys. To the east is a plateau-like region which descends gradually to the north from an elevation of 5000 feet in the upper lake region to 3000 feet in the Lower Lewes and Pelly River valleys. The river valleys in this stretch often lie 2000 to 2500 feet below the general plateau level.

The coastal belt of southeastern Alaska and westward to Kadiak island has the abundant precipitation and consequent luxuriant forest growth which characterize the northwest coast regions as far south as Puget sound, and hence the rock surface is deeply covered and the underlying rocks are decayed so as to make prospecting extremely laborious. But west of Kadiak island, along the coast, there is no timber.

In the interior region the precipitation is comparatively slight, and considerable portions are above or north of the limits of timber growth. The precipitation is, however, chiefly in the form of snow, and the soil is frozen for a large portion of the year, so that there is comparatively little rock decay. Where there is no timber the surface is generally covered with an abundant growth of moss. This, wherever the surface material is sufficiently compact to become impervious to water by freezing, produces large areas of swampy tracts, even on sloping ground, which, except in the glaciated regions or when cut through by large streams, obscure the rock surface and render difficult the work of the prospector.

It is not perhaps generally known that the theory of an Arctic ice sheet extending outward from the Polar regions has been proved by investigations of recent years to be fallacious. Many persons, including some who might be supposed to speak with scientific authority, have committed the error of ascribing to the placer deposits of the Yukon a glacial origin. It is now known that the great continental glaciers of former times spread out in every direction from certain elevated regions peculiarly subject to great accumulations of ice and snow, and that one such centered in the mountains of British Columbia between latitudes 53° and 59° N. and had a northwestward as well as a southward movement from that central region. The limit of the extent of this northward-moving ice sheet was readily recognized by the various geologists who have visited the region in recent times, and is roughly defined as crossing the Lewes river just above the mouth of the Big Salmon, and the White river near the Donjek, or following approximately the 62d parallel, so that the Yukon basin below these points has not been affected by any general glaciation.

At present, so far as known, it is only in the coastal region that deep mining is being carried on in gold-bearing veins. Here it has become a well-established industry, and many large quartz mills are running on the ore extracted from these veins. The principal deposits are found in a belt somewhat over 100 miles in length on the seaward slope of the mainland, reaching from Sumdum on the southeast past Juneau to Berners Bay near Seward on the northwest. This belt may be also considered to include the deposits on the shoreward side of Admiralty and other islands. A second belt, farther west, is represented by the deposits on the western side of Baranof island, not far from Sitka. The ores, though not always exceptionally rich, are worked at a good profit because of the natural facilities of the region for cheap reduction. The most notable instance of this is the great Alaska-Treadwell mine, which has extracted over $7,000,000 worth of gold from an ore carrying $3.20 a ton, which is worked at an average cost of $1.35. Such conditions cannot be expected to obtain in the interior.

These deposits occur in metamorphic slates, diabases and granites, all similar to the rocks of the auriferous belt of California, and probably, like those, they are of post-Jurassic age. Owing to the dense covering of living and fallen forest trees in this region, prospecting is extremely difficult, and it is probable that future exploration will prove the extent of these gold belts to be much greater than at present appears. The gold-bearing beach sands from Lituya bay to Yukutat bay along the west foot of the St. Elias range and the placers at the head of Cook inlet, around Turnagain arm and on the Kaknu river, may have been derived from the wearing down of rocks of similar age and composition on the Kenai peninsula.

At Uyak bay, on Kadiak island, gold deposits in slates are being worked, and the gold-bearing beach sands of the western end of that island and at Portage bay and the Ayakulik river, on the neighboring mainland, are apparently derived from metamorphic slates associated with granite, so that it is possible that these more recent gold-bearing rocks extend that far westward. On Unga island, of the Shumagin group, still farther west, gold occurs in eruptive andesites of Tertiary age, and several mines have been opened on these deposits, the most important of which is the Apollo, one of the most successful in the province. As the Alaska peninsula and the Aleutian islands are largely made up of recent eruptive rocks, this is an important indication, showing the possibility of the occurrence of valuable deposits in such rocks. Some mining and prospecting has already been done on the island of Unalaska, at the extreme point of the peninsula.

In the Yukon basin the gold, so far as known at present, is derived from a much older series of rocks, for the gold-bearing slates of the coastal region have not yet been recognized there. While the exact age of these gold-bearing rocks has not yet been determined, they are known to be older than the limestones supposed to represent the Carboniferous and Devonian formations of the cordilleran system; hence they are probably pre-Paleozoic, and in part are possibly as old as the Archæan. The grounds for assuming this derivation are that these rocks contain abundant auriferous quartz veins and that the richest placers thus far discovered are so situated that they must have been derived from them. These rocks are classified by Spurr as follows, commencing at the base:

Basal Granite Schist.—This, so far as known, is the fundamental rock formation of the region. The granite has characteristically a somewhat schistose or gneissic structure, thus showing evidence of having been subjected to dynamic action or intense compression, and it may pass into a gneiss or even a mica schist, where this action has been most energetic. On the other hand, it is sometimes massive, showing no parallel structure planes, and then is with difficulty distinguishable from the massive younger granites, which are also of frequent occurrence in the region in the form of dikes and intrusive masses cutting across older rocks. As distinguished from the granites of the coastal region, which are intrusive, these older granites are generally of reddish color and crumbly nature, while the later ones are dark gray from the abundance of hornblende as a constituent mineral.

Birch Creek Series.—Resting upon the fundamental granite is a series of rocks, roughly estimated as possibly 25,000 feet in thickness, named the Birch Creek series, from the place of their typical occurrence. They consist mainly of quartzitic rocks, generally thin bedded or schistose, so that they pass into mica schists; in some places they contain carbonaceous matter and develop graphitic schists. There are also bands which probably originated as intrusive rocks, but which, by compression, have become schistose like the other members. These rocks have abundant quartz veins; they are generally parallel to the schistosity or bedding, small and not persistent, but some cross the bedding and are then wider. They carry gold with abundant pyrites and sometimes galena. They are often broken and faulted.

Forty-Mile Series.—Younger than the Birch Creek series, but in general closely associated therewith, is another thick series of rocks, called the Forty-Mile series because of their development on Forty-Mile creek. They are characterized by alternations of beds of marble, from a few inches up to fifty feet in thickness, with quartzitic and other schists, which may be micaceous, hornblendic or garnetiferous, and sometimes graphitic. They are traversed by abundant dikes of eruptive rock, mostly granites and diorites. Two sets of quartz veins are developed in these rocks: (1) An older set, which are generally parallel to the schistosity or lamination, like those in the Birch Creek series, and like them are broken by later movements and carry pyrite and occasionally galena; (2) a set of larger veins, which form an apparent transition from dikes of aplite, a rock con-

sisting of quartz and feldspar. They cut across the bedding and are not disturbed by later rock movements, hence are younger in age.

Rampart Series.—This still later series is primarily distinguished from the preceding by the darker color of its rocks, which are dark green when fresh and become a dark red by weathering. They consist largely of basic eruptive materials, beds of diabase and tuffaceous sediments, with hard green shales and some limestones containing glauconite, or green silicate of iron. They also contain novaculites, or fine-grained quartzitic slates, and jasperoids, or iron-stained quartzose rocks. Serpentine and chlorite, noticeable by their softness and green color, are frequent alteration products. These rocks also contain a few quartz and calcite veins, which are generally developed along shear zones, or places where by rock movement and compression a series of closely appressed parallel fractures are developed. The basic character of these rocks and their large content of pyrite seem favorable to the concentration of ore deposits; they present, moreover, certain analogies, both in composition and in geologic position, with the copper-bearing rocks of Lake Superior. But the observed veins are younger than the joints and shear planes, which were probably produced by the rock movements that crushed the veins of the older series, and assays of their ores have as yet shown but insignificant amounts of gold and silver. These veins, as well as those in the granite, are, moreover, much less abundant than those in the Birch Creek and Forty-Mile series; hence it is thought that the latter are probably the principal supply of gold in the placers.

The younger rock series noted are, briefly, the following:

Tahkandit Series.—This consists of limestones, sometimes white and crystalline, generally green or black, alternating with shales. In certain localities, notably on the Tahkandit river, it has conglomerates carrying greenish pebbles supposed to be derived from the rocks of the Rampart series. In the beds of this series have been found fossils of Carboniferous age and plants of Devonian aspect.

Mission Creek Series.—Later than the Tahkandit series, but, like it, not very well defined, is the Mission Creek series, consisting of shales and thin-bedded limestones with gray sandstones. Locally, there are thin beds of impure lignite and at the base a conglomerate ("cement rock" of the miners) containing pebbles not completely rounded derived from older rocks in the neighborhood, which sometimes carries gold. The beds of this series are sometimes altered and sharply upturned and folded, but generally have a rather fresh appearance. In the neighborhood of shear zones they are impregnated with pyrite and carry small quartz veins. The limited exploration of these rocks has developed no important deposits of mineral. The age of the beds is as yet uncertain, but they are in part as late as Cretaceous.

Kenai Series.—Next above the Mission Creek rocks, and not always readily distinguishable from them, is a great thickness of rather loosely consolidated conglomerates, shales, and sandstones, generally greenish in color, which are the coal-bearing rocks of the region; they everywhere contain plant remains, and rest unconformably upon the older rocks. They have, however, been folded to a certain extent, and stand upturned at angles of 20° to 60°. They are supposed to be of Eocene Tertiary age.

Later Tertiary Beds.—Other and more recent Tertiary beds have been observed, generally in the more open country of the Lower Yukon, which have little economic importance, though they sometimes contain thin lignitic seams. They are variously known from the localities where they have been observed, as the Nulato sandstones and the Twelve-Mile and Porcupine beds, the two last named being assumed to belong to the same series.

The more recent formations, silts and gravels, will be considered under the heading "Detrital or Placer Deposits."

The most definite facts with regard to the occurrence of the gold-bearing formations, the Birch Creek, Forty-Mile, and Rampart series described above, were obtained by the reconnoissance made by members of the United States Geological Survey in the summer of 1896, under the charge of J. E. Spurr, in the American portion of the Yukon district.* Data gathered by earlier geologists, notably those of the Canadian Survey and of C. W. Hayes and I. C. Russell of the United States Geological Survey, have provided suggestions as to the extent of these rocks in outside areas, but the reader need only bear in mind the enormous area, the difficulties of exploration, and the want of accurate maps of the region, to realize that generalization must as yet be very tentative and liable to future change.

As shown by the map, the belt in which these rocks have been found extends about 500 miles in a general northwest-southeast direction, but there are indications that the actual extent of these exposures may be twice as great.

The best-known exposures of these rocks occur along the northeastern flanks of a broad belt of fundamental granites and crystalline schists which apparently form the central nucleus or backbone upon which they rest. This belt is known in a general way to extend up the Tanana river from near its mouth southeastward across the White river below the Donjek. In the latter region C. W. Hayes reports quartzites and limestones resembling the Birch Creek and Forty-Mile series on the southern flanks of the granite, but the width of the belt, and whether there is any considerable extent of the gold-bearing formations along its southern flanks, is as yet unknown. It may not improbably extend into the high range south of Tanana, of which Mount McKinley is the culminating point, and in which the Kuskokwim and Sushitna rivers of western Alaska take their rise, for from the reports of Moravian missionaries and of the traveler Dickey it appears that gold occurs in the sands of each of these streams. To the westward the granite backbone appears to pitch gently downward, as its surface area narrows, and no exposures are known west of the Yukon river. It is probably not a continuous mass of granite on the surface, but contains smaller areas of the later rocks folded in with it. East of the international boundary the area in which the granite occurs apparently widens, but its exposures are less continuous, the overlying rocks not yet having been worn away. One granitic axis appears to extend eastward from the Forty-Mile district through the Klondike region in a nearly east-west direction, which is the prevailing strike of the sedimentary rocks. The Canadian geologists report a second granite axis on the Dease river just below Dease lake, which may belong to the older granites, though they do not make the same distinction that Spurr does between the older granites and the later intrusive rocks.

Rocks of the various gold-bearing series above the granite are reported at the following localities: Their first appearance, to one ascending the Yukon from the sea, is near the mouth of the Nowikakat. From here up to the Tanana river, rocks of the Birch Creek series outcrop frequently along the river, when not concealed by Tertiary sandstones and conglomerates, and the range of low mountains on the north side and parallel to the river is probably formed of these and Forty-Mile rocks. About three miles above the mouth of the Tanana granite is exposed on an island in the Yukon, and twelve miles higher calcareous quartzitic schists of the Forty-Mile series appear under the Tertiary conglomerates. From the mouth of the Tanana up to Fort Hamlin, at the lower end of the Yukon Flats, the river runs in a canyon-like channel, known as the Lower Ramparts, cut through a low range of mountains which consist principally of the dark greenish and reddish rocks of the Rampart series, except where these are buried under Tertiary conglomerates. The latter rocks occur immediately above the exposures of Forty-Mile rocks, and again from Mynook creek up beyond the mouth of Hess creek. Higher up on these streams the Rampart rocks come to the surface, and the Forty-Mile rocks are supposed to be uncovered at their very heads. Between the two areas of Tertiary rocks the Rampart rocks occupy a belt fifteen to twenty miles wide along the river, and are cut by great dikes of intrusive granite.

From Fort Hamlin up to near Circle City, a distance, neglecting curves, of about 200 miles, the river flows through a perfectly flat region covered by fine silts and gravels, known as the Yukon Flats, in which no outcrops of solid rock have been observed. In the Birch Creek district, around the headwaters of Birch creek and southwest of Circle City, the Birch Creek series occupy a broad area; their general strike is east and west, curving at either end to the northward, and the prevailing dip is between 5° and 30° to the south. There is, however, evidence of a northern dip as well, and the Forty-Mile schists and marbles rest upon them along the trail to Circle City. Marbles, probably belonging to the Forty-Mile series, are also reported in the hills between Birch creek and the Tanana to the southward.

At the crossing of Birch creek by the trail from Circle City, and along the Yukon river for thirty or forty miles above the Yukon Flats, rocks with the characteristic dark coloring of the Rampart series are exposed. From these up to the mouth of Mission creek rocks of the Tahkandit, Mission Creek, and Kenai series occupy the banks of the river. On Mission creek itself only these later formations are found, but the gold in the gravels is supposed to come from the conglomerates ("cement rock") of the Mission Creek series, which contain pebbles of the older rocks. On American creek, the main branch of Mission creek which comes in from the south, the dark rocks, shales, limestones, and tuffaceous beds which form the bedrock are supposed to belong to the Rampart series, which also occur along the Yukon river from five to ten miles above Mission creek to within twenty-five miles of the mouth of Forty-Mile creek. Above this to some distance above Forty-Mile creek the river runs in beds of the Mission Creek series.

A Plea to Speaker Reed.

J. H. Neff, president California State Miners' Association, recently sent a letter to Hon. Thos. B. Reed, speaker of the House of Representatives, Washington, D. C., regarding the California mineral land bill, in which, among other things, he called Speaker Reed's attention "to the bill now pending in the House, on favorable report from the committee, called the Mineral Land bill, and intended to provide for the examination and classification of the unpatented lands lying within the limits of the land grants to various railroad companies in this State. This bill is similar in effect to the 'Idaho-Montana act' passed by Congress in 1895, and its passage is earnestly desired by the miners and general public of this State as a proper measure to preserve the mineral lands lying within such grants to the miner and the prospector.

"It is not the purpose of this bill to deprive any railroad company of any lands belonging to it by virtue of any grant made by Congress, but to segregate the mineral from the non-mineral lands in such grants.

"Congress has repeatedly declared that the railroad companies should not have the mineral lands within their grants and that no Act of Congress should be construed to give them any, but the machinery provided by existing law is inadequate to provide for the proper investigation of the character of the lands sought to be patented by the railroad companies, and the result is that the patents are too often issued to them without the consideration which the interest of the Government and the public requires.

"This is particularly true in this State, where large tracts of well-known mineral land and land lying within well-known mineral belts have been patented to railroad companies as non-mineral land.

"To remedy this, the California Miners' Association, composed of about 8000 representative mining men of this State, has had the said bill drafted and presented to Congress by Mr. De Vries.

"We respectfully urge upon you that you do whatever may be within your power to secure for this measure a hearing before the House."

Points on Headlights.

To the Oregon *Mining Journal* W. J. Wimer, of Waldo, Or., writes:

For years we were at a great expense keeping those heavy round glass points in our headlights; they are very expensive, difficult to cut and hard to keep in when once they get cracked, besides that they are always on a strain in a metal frame and break much quicker on a metal base than in a wooden sash. Two years ago I made wooden sashes for our lights, since which time we have had very little trouble with them and small expense.

A glass 12x14 if set high at the bottom is large enough, 12 up and down and 14 wide. Common window lights are better and give a better light than those thick, heavy ones.

To make the sash use coal oil box material, cut four pieces long and wide enough to fit your lamp frame inside and leave a square hole the size you want your glass; now cut out four more strips for the back of sash, drawing them in a little all around for the glass to lie on; tack these eight pieces together with wire nails, clinching them on the inside; take off the metal strips inside of the lamp frame so the sash will fit up close to the front; make two holes through the metal, one at the top and one at the bottom, insert two common wood screws into your sash to hold it; fasten the glass in the frame with tacks same as window lights. Your tacks should be outside so you can replace a glass without taking the frame out. This way one size glass will fit all the lamps in a mining camp.

Coal Statistics of Pennsylvania for 1897.

The following statistics are reliable and official as regarding the anthracite product of Pennsylvania for 1897:

	Anthracite. Long Tons.	*Bituminous, Short Tons.*
Tons of coal mined	46,947,354	54,674,452
Tons of coke made		8,533,291
Persons employed	149,557	88,554
Coal mined per employe	314	617
Coal mined per miner	490	744
Fatal accidents	424	149
Non-fatal accidents	1,106	426
Life lost per 1000 employes	2 83	1.68
Accidents per 1000 employes	7.39	4.81
Production per life lost	110,725	366,942
Production per non-fatal accident	42,448	128,344

Compared with 1896, these statistics show a decrease in the production of anthracite coal of over a million tons, while the output of bituminous has increased nearly four and one-half millions of tons, and the output of coke nearly two millions of tons.—Mines and Minerals.

California Electrical Enterprises.

California leads in the number and magnitude of its electrical enterprises as it does in other things. The stimulus given to the development of the State by the discovery of the fact that gravity and electrical generators can convert into energy and power California streams flowing from the mountains has put into successful operation several commendable projects in this State that at first were deemed almost impracticable, but are now of commercial value. Considerable space has been given in these columns to illustrated descriptions of great California schemes, from their inception to their successful completion. Many of them challenge the admiration of engineers everywhere, and the fame of the State has thus been sounded to the remotest corners of the earth.

The extension of what were already large enterprises is in contemplation, with assurances of ultimate success. Fresno county, in the southern part of the State, is the site and center of one of these unusually large electrical projects. The power is derived from the north fork of the San Joaquin river, delivered in Fresno City—a distance of thirty-six miles from the generating station—and utilized there for light and power. This system has now been extended to Hanford—a further distance of thirty-three miles—and will probably be delivered by 19,600 volts. This electrical extension is believed to be the longest line and highest voltage in the world. The transmission of electrical power over a wire sixty-nine miles in length is an event in the history of electricity. On this line the electrical loss is unusually low—a maximum of 18 per cent, including water wheel loss at the generating station.

At Visalia, in Tulare county, likewise in the southern part of the State, the mayor of that city and the manager of the local water works, with others, are interested in a project to bring electrical power, amounting to 1600 H. P., to Visalia from a point thirty miles east, utilizing the waters of the Keweah river, the plant to cost about $250,000. Work has begun, and it is expected that by August 1st, '98, it will be in successful operation.

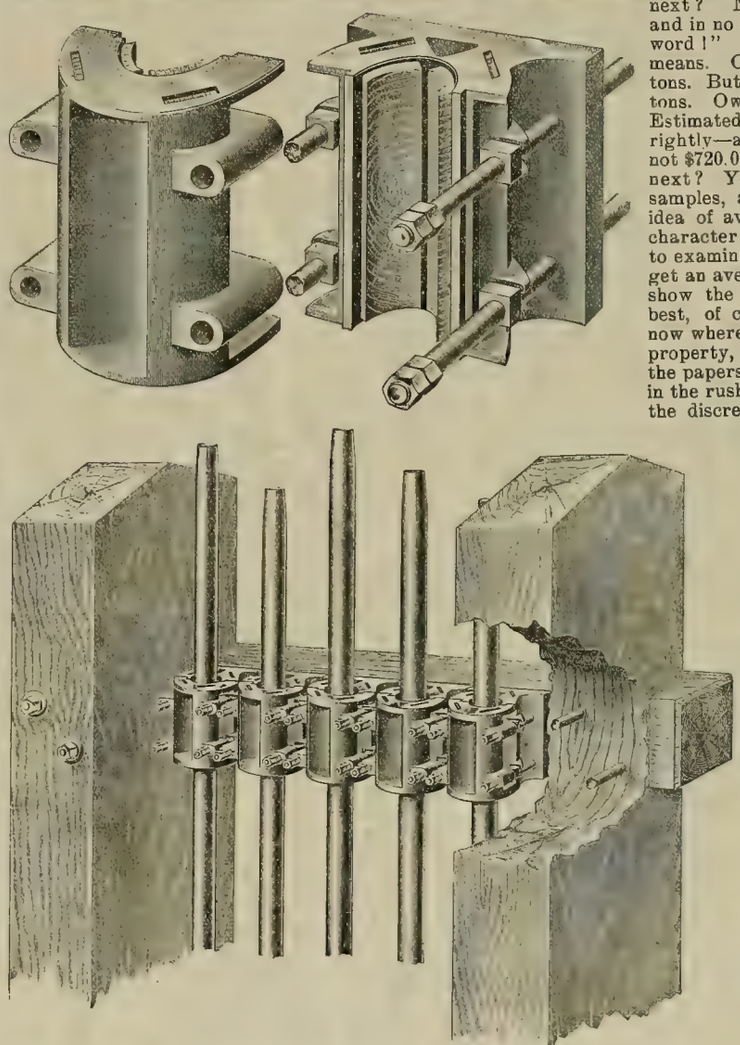
In Los Angeles, also in the southern part of the State, the San Gabriel Traction Company organized last week with a million-dollar incorporation, the proposition being to build an electric line from Los Angeles to Pasadena, with branches to Duarte, Monrovia and Sierra Madre. These are among the latest, but do not comprise all in that section of the State.

Another, of interest to San Francisco, embraces the transmission of 10,000 H. P. from the Sierras in Alpine, Amador and Calaveras counties over a line 110 miles in length to San Francisco. The Blue Lakes Water Company system in the counties mentioned is relied upon to furnish sufficient water supply. This company has several natural and artificial reservoirs, ranging in altitude from 6000 to 8500 feet above the level of the sea. Other storage sites have been decided upon, which, in connection with those already established, will, it is believed, furnish sufficient water and fall to meet all practical requirements. This portion of the plant is of itself a huge scheme, but one that, properly managed, is susceptible of success. The total storage capacity of the present reservoirs is 210,000 million gallons.

The method of developing electrical power is by means of a water wheel, to which the water from the end ditch is led by large wrought iron or steel pipe of sufficient strength to resist the great pressure. It is intended in connection with this last scheme that the ditch and canal system will end in a terminus where there shall be a fall of about 1050 feet, occasioning static pressure of 480 pounds per square inch on the pipe. The end of this pipe is to be divided into several "Y" branches, leading into the power house, the elevation of that being 620 feet above the level of the sea.

At present there are three 600 H. P. generators, and small transmission lines for power and lighting run north through Amador and south through Calaveras counties, the latter being leased by the California Exploration Company for a period of thirty years under contract.

The idea is to supply dynamos sufficient for 10,000 H. P. at the power house, and, if the demand justifies, to supply additional dynamos sufficient for 10,000 more. A voltage of 30,000 volts is to be used through a copper ⅜-inch wire, which will weigh about 8000 pounds per mile and will cost in the neighborhood of $120,000. In this regard the idea is to have the transmission line as short as possible and to have one transformation of the intensity of the current. It was intended originally that a conduit should be constructed under San Francisco bay; but it is manifest that a tower construction would be less expensive and more feasible. The tower line has been located along the eastern side of the Alameda peninsula, and if the requisite permission can be secured from the United States government, it is proposed to carry this power on the tower line across San Francisco bay to this city.



As stated, this huge project involves the transmission of electrical force from the high Sierras 110 miles to the sea. Reaching this side of San Francisco bay, the line would run through the manufacturing belt of the Potrero, the idea being to supplant coal and steam by electricity. The problem of fuel in San Francisco has always been a serious one to manufacturers. In the central Mississippi valley coal for making steam can be bought for $1.50 per ton; in San Francisco it has cost $7 per ton.

The scheme involves the expenditure of about $1,000,000—three-fourths of which would be required for the building of the electrical machinery and transmission line. Of course the engineering problems involved are arduous and difficult — among others the suspension line across San Francisco bay. Local concerns say that for $50,000 they can build the required three high steel towers—the tops of which should be 200 feet above the surface of the bay. It is proposed that between the tops of these a steel carrying cable shall be suspended, to which is to be attached the transmission line.

This is a mere outline of the scheme. That it is not visionary is evident by the attention given it by practical men. Upon the successful completion of such projects depends largely the prosperity of the manufacturing future of this city.

Improved Sectional Stamp Guide.

Herewith is illustrated an improved sectional stamp guide, interchangeable and made to fit and replace the regular common guides whenever so required. They are furnished by the Edw. P. Allis Co., 9 Fremont St., San Francisco.

IMPROVED SECTIONAL STAMP GUIDE.

Crushing, Friendly and Amusing.

TO THE EDITOR:—A friend of mine, who has been endeavoring to enlarge his fortune by mine promoting, received from his correspondent some days ago quite a crushing letter, which, in his tribulations over it, he brought to me to see what I thought of such criticisms, and how it had better be answered. It amused me so much I thought it well to have your readers take a smile also, and especially as it applies not only to my friend's lack of judgment when properties are framed up for the Eastern market, or elsewhere, but to very many others, who may get a very good lesson through it. Well, here it is: B. L. D.

NEW YORK, Jan. 15th, '98.

DEAR SIR: You write the funniest letters. If your imagination would prove as active in writing a novel as in your correspondence with me about mines, Dickens would not be in it, and mining, as compared to your success in fiction, nowhere. In a general way, all your premises and statements are wildly incorrect. The first statement you gave of the ——— gold mine was a short one by letter, in which you said you would get more data and report. I went and saw B. and he said all right—he would like a property just such as you laid out. He said, also, he would like a brief but concise report, written by some one who knew how to make it, which quietly implied to me that you did not. A report came, and he looked over it, and spotted the lies at once, saying no vein 150 feet wide ever carried the richness stated. Your letter indicated higher values than the report, consequently they will await the assays. All you sent me I know as well as you do, and far better, and so did he, all the time; and I think I know some things you don't appear to know, or prefer to overlook, one of which is that you have never gotten your trade in shape—I mean to a point of final consummation. It is all the time promised. You all the time keep me waiting for something beyond. The other statements sent all contradict your letters. You quote the report quite flippantly, but I notice you don't attempt to reconcile the letters to it, which state * * * report is a lie. In his report he goes on and describes a property having $20 ore and $720,000 in sight, based on one shaft and several drifts, running in several directions. In his letters he repudiates all he said of physical facts—facts in his report—and now says he took the owner's word for it. You also say "owner's description of the property," "owner's word" on a property, and that to be presented to the largest house on this continent! What next? No such drifts as stated and in no such directions. "Owner's word!" You and I know what that means. Ore in sight not quite 30,000 tons. But I know there is not 15,000 tons. Owner's word again for you. Estimated value, if I recollect it rightly—and I do—is $270,000, and not $720,000, as in the report. What next? Your expert then sends you samples, as he states, not with any idea of average value, but to show character of the rock. A man sent to examine a mine and no attempt to get an average sample of the ore to show the value, but specimens—the best, of course! What next? I see now where I stand in presenting this property, and I quietly work to get the papers out of their hands, hoping in the rush of business they will forget the discrepancies and thus save our credit; but you take them and bind them as a crown unto yourself. What next? To cap the climax of folly and errors—and, I will say, foolishness—the assays follow me to Mexico. And what are they? These picked specimens of rock show an average value of $7.94 a ton—not $18, and $20, and $50, and $69, and $73, as reports state. And assays included all metals! Now, I think you will agree with me, that to be made a damned fool of sixteen or seventeen times in different directions, on the same property, and with the same parties in the one deal, is quite enough. Now, you may think I am annoyed at the situation and your letters, but I am not. I appreciate the situation a fellow is in, with a mine for sale on an owner's statement.

Your friend, ———.

Such occasions are not extremely unusual. San Francisco mining engineers generally are cognizant of the fact that a large number of mining statements and reports can be found at any time in San Francisco about our interior mines, all on the market for sale, but when an expert of mines comes to examine them some of them often show on their face inconsistencies and misstatements, that do more harm to the mining interest than a proper report would make. For such a statement to go East or to Europe it is still worse, by causing an outlay for examination, which ends not only in loss of expense money, but loss of confidence and a feeling of disgust, to the great injury of California.

Reporting on mines, where one has experience, is a very exact work, and properly done—we may say honestly done, and in detail—a buyer can tell if he wants a property of the kind. And if the report shows on the face that it was made by one who understands his business, a great point is gained; but if full of inconsistencies, a doubt is thrown on the whole and an injury is done to owners and the State as well. A clear, concise, truthful statement goes a long way in selling a meritorious mining property.

Cyaniding and Chlorination.

Concluding an article on the electro-chemical treatment of gold and silver ore, C. E. Webber notes that the presence of the excess of an acid such as hydrochloric acid has to be provided for by the addition, say, of lime, to make the solution neutral; but this will not get rid of any excess of hypochlorite, if present. Lime, to remove free chlorine, will not be added until any metals in the solution, such as copper sulphides, or arsenides, have been formed into electrolyzed salts through conversion into chlorides. These, which cause waste of cyanide of potassium, would to a certain extent go into solution, and, by electrolytic action, become deposited in the mercury and their values saved. It will be understood, therefore, that all this preliminary work not only amalgamates a large proportion of the free gold and silver, but also prepares for the more effective action of potassium cyanide, both as a solvent and as an auxiliary in producing the condition of increased conductivity in the solution.

Thus, everything that chlorine can do to help the disintegration of the metallic ores which are found accompanying gold facilitates the action of potassium cyanide when it is added. This preliminary disintegration would be helped, not hindered, by temporary increased acidity of the liquid, when bodies like sulphides are oxidized at the expense of the chlorine; showing that the best time for neutralizing the solution is at the end of this preliminary stage, and just before the potassium cyanide is introduced.

In all this preliminary stage it will be seen that the eventual economy of potassium cyanide (or other solvent) should be aimed at, because, although with "percolation" processes the "leaching" can be effected with even half a pound of it, as much as two pounds of it to the ton of ore under treatment may be here required. Obviously, the greater part of it is wasted, as, in treating a low-grade ore containing, say, fifteen grammes of gold, and, say, thirty grammes of silver, 60 per cent of the gold and 40 per cent of the silver may be separated and amalgamated in the first two or three hours, and before the potassium cyanide is added. Clearly, it does not require two pounds to treat six grammes of gold and eighteen grammes of silver, even if all the values that remain in the sludge could be dissolved.

The addition of potassium cyanide (K C N) to an ordinary agitating vat causes the solution of some of the finely divided gold; and a further solution will ensue when, by the passage of an electric current, a decomposition yielding free cyanogen at the anode and caustic potash and hydrogen at the cathode will ensue. So far the reactions are common to all arrangements which combine agitation with electro-cyanide processes.

It is also desirable to have some cyanide to spare, because the cyanogen ($C_2 N_2$) formed at the anode and dissolved in the solution will readily unite with the minutest and lightest particles of gold, to form with some of the said excess of it the double cyanide of gold [Au K $(C N)_2$], which is a salt that is easily soluble and readily electrolyzed.*

Mr. Webber concludes that these conditions point to the advantage of getting rid of any excess of hypochlorite and of acidity by neutralization before the cyanide (K C N) is added; also, avoiding excessive oxidization of it, when, if an insufficiency were to ensue and tests were neglected, it is possible that Au CN might be formed and remain insoluble, and hence escape electrolysis and pass away in the tailings.

There is an advantage also in the simultaneous electrolysis of both sodium chloride and potassium cyanide, though the duty of the former is principally to facilitate the conductivity of the electrolyte. Chlorine and cyanogen are both yielded at the anode, and would probably lead to the production of cyanogen chloride, which (in common with cyanogen bromide) would be in the presence of potassium cyanide, as effective in attacking gold, if not more so, as cyanogen itself. The difference between this and what is known as the Sulman-Teed process is, that in that cyanogen chloride (or bromide) is added mechanically to a solution containing potassium cyanide and gold or silver ore, whereas in this process the conditions is to effect a corresponding reaction are produced electrolytically.

The following is a simple means of testing quantitatively for the presence of gold and silver in the solutions with potassium cyanide as a solvent at each stage of treatment, which can be easily used by the lawyer in charge: Take 500 cubic centimeters of solution. Heat nearly to boiling point. Add two grains sulphate of copper (bluestone) and two grains of sodium sulphide. Add hydrochloric acid, so as to have a strong acidity. Heat to boiling point. Filtrate the black precipitate in which all the gold and silver are retained. Scorify the precipitate with 50 grains litharge. The precious metals are recovered from the lead by cupellation. The sodium sulphide used in this test is made in a very simple way, by fusing in a crucible one part of carbonate of soda and one part of sulphur. The crucible must be well covered.

*Observation to ascertain the continued presence of cyanide (K C N) is made from time to time with the nitrate of silver test—drop in the test-tube of the solution. If too much chloride of sodium is present, the effect would be masked by the formation of chloride of silver, when it would be difficult to distinguish the cloudiness of liquid caused by the one from that caused by the other. In such case iodide of starch, which is bleached by potassium cyanide, but not by chloride, is useful as a substitute for nitrate of silver.

The Witwatersrand Banket, With Notes on Other Gold-Bearing Pudding Stones.*

NUMBER IX.

By GEO. F. BECKER.

There seem no other possible theories besides those discussed, but Mr. Hamilton Smith is quoted as stating that, in his opinion, the gold is partly detrital and partly in place in the banket. Speaking with exactness, I agree with him, for, as he has mentioned, the white quartz veins are not absolutely barren. To my mind, however, it seems conclusively proved that only a minute fraction of 1 per cent of the gold has this origin, for I see no reasonable evidence that any portion of the gold, excepting that to be found in the white quartz seams, is untransported.

Consequences of Placer Theory.—On the theory which I have adopted the auriferous banket should be found to stretch along a line of ancient coast bounding an area in which gold-bearing quartz veins were rich and numerous. How large this area may have been, and therefore how long its ancient coast was, is as yet impossible to say; but the indications are that the area was extensive and the coast long. Doubtless some portions of the coast will furnish only banket too poor to work, but until the Lower Cape formation has been traced across the continent of Africa other spots as rich as the Rand may be hoped for.

In the search it will probably be found that coarse pebble is a necessary, though an insufficient, indication of rich ore. In other words, to produce rich ore close natural concentration and therefore rapid currents were needful, but these could not avail to produce rich reef along stretches where there was a deficiency of gold. As was pointed out above, the oceanic currents about South Africa must always have flowed in a westerly direction; for these currents are ultimately referable to the direction in which the earth rotates. These currents must have been strongest where least impeded, and can not have been of full strength in bays or bights.

Were the Main Reef series continuously exposed across South Africa, marking the southward termination of the continent in the early Paleozoic, such general considerations might be neglected. As a matter of fact, this series is only very partially exposed, and must be sought on some theory or other under later formations. In such a search it is certainly important to note that coarse banket at any point means a shore along which the currents were unobstructed and which was unsheltered by promontories projecting still farther south. This hint may be considered useful in discovering the banket, however this has been charged with gold. On the other hand, if the marine placer theory is true, the westerly side of promontories will show small pebble and little gold, and this will be true, also, of bays and bights in proportion as they are offered protection from the coastal currents.

The confidence with which the deep levels of the Rand can be explored must depend largely on the true theory of the origin of the gold. On the favorite impregnation theory the deposits must be subject to the sudden, seemingly eccentric, changes of quartz veins. At any time the gold tenor might be found to drop suddenly to zero, because unforeseeable obstructions had prevented the circulation of the auriferous solutions over a certain area. On the other hand, on the marine placer theory a sudden failure of gold is not to be anticipated, and a discussion of the conditions along the outcrop furnishes strong reason to believe that the yield will keep up to a great depth.

Other Pre-Tertiary Gold-Bearing Pudding Stones.—Examination of the auriferous conglomerates or banket of the Transvaal has led me to believe that this rock is an early Paleozoic beach deposit, closely analogous in origin to those now forming both on the Pacific coast of North America from Lower California to Alaska and on the New Zealand shore. The Witwatersrand banket is sometimes discussed as if it were the only gold-bearing pudding stone yet discovered, excepting, of course, the well-known Tertiary and Post-Tertiary river gravels. As a matter of fact, a considerable number of pre-Tertiary auriferous conglomerates are known. They occur in North America, Australia, New Zealand, and even in France; some of them are also (locally at least) very rich, but none of them is known to be both extensive and rich, like the main Main Reef series of the Transvaal. It is a matter of interest to compare such occurrences, so far as they have been described, and for that reason the following notes are set down. They are doubtless incomplete, for I have not made a systematic search for instances through geological literature, yet they seem sufficient in number to show that the Witwatersrand banket is anomalous only in its vast aggregate value.

In France.—Gold is found in a Lower Carboniferous conglomerate (millstone grit) in southern France, in the Department of Gard, near Besseges. According to M. Theodore Picard this conglomerate furnishes the gold dust carried down by the Gardon, the Ceze, and the Gagnieres. According to Mr. J. A. Phillips this conglomerate has been worked and has yielded small quantities of the precious metal. There can be no doubt, it seems to me, that this conglomerate, one of the most persistent and widely spread horizons in Europe, is a marine shore deposit.

In Nova Scotia.—An auriferous conglomerate which has been worked to some extent occurs in Nova Scotia, Colchester county, at Corbetts Mills, four miles north of Gays river. It is pronounced Carboniferous in age, and lies unconformably upon the older metamorphic rocks, these last being Algonkian or Cambrian, and intersected by small, rich gold-quartz veins. According to Mr. C. F. Hartt this banket is rich for a foot or more from the bottom; the gold occurs in scales up to a quarter of an inch in diameter, and sometimes twenty or thirty scales are visible in a mass of less than a cubic inch. Sir William Dawson writes:

"The conglomerate is formed of the debris of these older rocks, and gold occurs in it exactly as in modern auriferous gravels, being found in the lower part of the conglomerate, and also in hollows and crevices of the underlying slate."

Mr. H. S. Poole writes: "In the 'runs' or hollows of the slate the bed rock is removed to a depth of 3 or 4 feet for the gold contained in the backs or crevices of the slate. The gold is not very fine and pieces of over a pennyweight are only occasionally found. Usually the surface of the grains is rough, not as though it were fresh from a lead, but rather as if each grain or piece of gold had been first smoothed by attrition and afterwards had fine particles attached to it."

In response to an inquiry, Mr. Geo. M. Dawson informs me that the conglomerate at Corbetts Mills is "evidently a fossil placer and not an impregnation. Small scales of gold embedded in it, when examined with the magnifying glass, have the rounded form usual in placer deposits, but in addition are usually evenly roughened, evidently by the subsequent pressure upon them of surrounding sand grains." The description of Mr. Poole would lead one to suppose a secondary crystallization of gold on the surface of nuggets, but if this is the opinion which Mr. Poole intended to convey Dr. Dawson dissents from it, as is mentioned above. The alluvial gold scales of the Rand, too, are probably distorted and roughened by the pressure of sand grains. Mr. E. R. Faribault has been good enough to send me, through Dr. Dawson, the following note on this interesting occurrence:

"The auriferous conglomerate at Corbetts Mills, Gays river, Colchester county, Nova Scotia, is a coarse conglomerate at the very base of the Lower Carboniferous, resting directly on the Upper Ferruginous slate group of the gold-bearing rocks of Nova Scotia. It is wholly made up of the detritus of the gold-bearing slate. Most of the smaller pebbles are well waterworn and have the form of seashore pebbles, and vary from the size of a hazelnut to that of an egg; but quite a few pieces of slate and quartz are not in the least waterworn, and these are generally much larger in size. The matrix is composed of a gritty mixture of quartz, slate, and hematite, cementing the whole very firmly. The pebbles are not, however, uniformly arranged where they are mining. This bed of conglomerate has been traced and found more or less auriferous for some four miles along the face of a ridge of gold-bearing slate, rising to about 150 feet above the level of the Carboniferous basin. A belt of quartz veins, many of them proved to be auriferous and some of them of great extent, follows the top of this ridge along a steep anticlinal fold, and its debris brought down the hill by numerous small streams have certainly largely contributed to make up the auriferous conglomerate at the beginning of the Lower Carboniferous period.

"The conglomerate has been worked by levels leaving the line of outcrop at right angles and following the gentle slope of the underlying slate rocks. The miners have noticed that the gold was coarser and most plentiful about the line of the present outcrop of the conglomerate, getting finer and scarcer the farther they recede from it. Most of the gold has been found at the very bottom of the bed of conglomerate in the matrix or in very thin flakes on the surface of the pebbles; and crevices in the slate, running at right angles to the stratification and cleavage, were found very rich, in some cases to depths of 10 to 14 feet. A shaft sunk about 800 feet distant from the line of outcrop gave the following section of Lower Carboniferous:

	Feet.
Surface drift	20
Quartzose feldsphatic conglomerate	35
Coarse sandstone	2
Coarse irregular conglomerate (auriferous)	8

"My conclusion is that the auriferous conglomerate of Gays river is a littoral deposit of marine origin."

Stamp Milling of Gold Ores in Its Relation to Cyaniding.

It has been more than once said that intelligent discussion of a paper read before a technical society is as interesting and valuable as the paper itself. In the issue of February 5th appeared an address on "The Stamp Milling of Gold Ores in Its Relation to Cyaniding," by E. H. Johnson, before the Chemical and Metallurgical Society of South Africa. At the following meeting of that society, January 15th, '98, F. White said:

The author of the paper on "The Stamp Milling of Gold Ores in Its Relation to Cyaniding," is evidently very doubtful about the gravitation stamps being the most suitable machine for preparing pulp for cyanide treatment. This latter process has effected as great a change in gold extraction as Bessemer's discovery made in the manufacture and in the extension of the use of steel. I cordially support him in his endeavor to bring about a better state of things, and hope that we shall see that stamps can be made to give something near the product required for cyaniding purposes, that is, as near as a machine working on a wrong principle can do it. Some data which I have obtained during my investigations as to the merits of different classes of crushing machines may be of use in this discussion, for they show the effect produced mechanically as well as the effect obtained by cyaniding. In reference to the results given in table No. 1, the following explanations should be made: The product from the wet crushing mill, with 900-mesh screening, contained 27 per cent of slimes which were not cyanidable. The minus 90-mesh (8,100) which was treated in the cyanide vats was therefore 37 per cent of the total. It was not found possible to cyanide the product from the dry crushing stamp until 13 of the 49 per cent of minus 90-mesh had been removed, leaving 36 per cent. The minus 90 product from the Niagara pulverizer should have been higher, probably 36 per cent, as some dust escaped from the settling chamber during the trial run when the sample was obtained. Table No. 2 gives an account of the different sizes of grains obtained in dry crushing by rolls, the different values, and the extraction obtained from each size. The finer sizes are notably the richer, due to the fact that the major part of the gold is extremely fine, and naturally accompanies the smallest grains through the finer sieves. It is not likely that a similar test made with tailings which have passed over amalgamated plates would give equal results. The difficulty experienced in getting two samples giving exactly the same quantity of grains of different sizes, make it impossible to make the calculations work out exactly in all cases. I have made a diagram which shows very clearly the different proportions of different sizes referred to in table No. 1. The line in the first column shows the amount of minus 90 product which can be present without impeding percolation. The ideal product which should be sought after is not that which gives the highest metallurgical extraction, but that which gives the best economic mean when the value of the gold won is compared with the cost of mechanical preparation plus the expenditure required to recover the gold. As an example, in table No. 2 we see: The minus 30-mesh product gives an extraction (by assay) of 84.49 per cent, while minus 90 gives 94.11. The difference, on 10-dwt ore, would be worth 46d, which would probably without difficulty cover cost of reducing the first to the size of the latter. But here we appear to have reached the economic limit, for the difference between the minus 90 and the minus 120 is only 1.79 per cent, worth say 7½d per ton, which would not pay for the cost of reducing the one size to the other. If some of the members of this society were to investigate the tailings they are treating, finding out the proportions of the different sized grains and then assay values before and after cyaniding, they would be well repaid for their trouble. Year by year the tendency is to use coarser screens in the batteries, but there is little doubt that the stamps crush an unnecessary proportion of the ore to a degree of fineness which is not required to give sufficient access to the cyanide solution, while, on the other hand, this excessive fineness is objectionable and involves increased expenditure.

TABLE NO. 1.—PROPORTIONATE QUANTITIES OF DIFFERENT SIZED GRAINS PRODUCED BY DIFFERENT SYSTEMS OF ORE-CRUSHING MACHINES.

Class of Crusher.	Class of Ore.	Mesh.	Percentage obtained which passed a certain mesh, remaining on the size following.			
			900	*1600*	*3600*	*8100*

Concerning Certain Physical Theories.

NUMBER II.

Do the sun and planets radiate heat into space, and so cool off? All known facts indicate that no atom of matter, or particle of energy, is lost in Nature. It is unphilosophical to suppose that nearly all the energy of the sun should be thrown away and lost, unless such waste be proved. In a clock a small spring supplies all the power needed to keep the pendulum going. Imagine a 100 H. P. engine running for the sole purpose of actuating one small clock. Yet the ratio of waste is less than that believed to be going on in the solar system. The planets are supposed to receive, say, one twenty-millioneth of the heat and light emitted by the sun, and of the amount received, Proctor, after Hershel, estimates that the earth utilizes one part in twelve million millions. If on every square inch of surface of earth, both sea and land, there could be piled up 1000 copper cents, less than one-fiftieth of them would represent the proportion of sun light and heat really used, the remainder being wasted. Contrast these figures with the fact that on the earth we see only the most rigid economy. The leaf falls from the tree, the avalanche from the mountain; animals and plants live, grow and die; the winds fan the earth, and the tides beat against the rock; but in all there is no waste. Every bit of matter, or energy, is carefully conserved and used over and over endlessly. All this is true to the upper limits of our atmosphere. Beyond that we are asked to believe that there reigns the most boundless and foolish extravagance: that the earth receives daily billions of foot-tons of energy and heat, but throws it all away, and daily grows colder; that immeasurable force has been stored in the sun for the sole purpose of wasting it; that suns and stars everywhere are cooling and dying in consequence of this unnecessary waste of their resources; hence, that the Creator deliberately prefers dead and dying worlds to those ever fresh and fair. Imagine a ship's crew on the ocean tossing overboard in sheer wantonness their food, and dying in consequence. It would be the act of mad men. If the universe cools down to the absolute zero, say, 480°, then what? If human souls live hereafter, they must look forward to a condition it may be indelicate to hint at. If the fires of Hades burn eternally, they must be exceptions to the radiant heat theory, and form the only comforting prospect ahead for shivering souls. If there is a constant stream of heat to the earth and another from it, it would seem easy to stop waste by turning the outgoing stream back to the earth. Every cloud in the sky does that very thing. An extension of the process would stop all waste. But there is probably another way of doing the same—in the flow and reflow of electricity, or some other form of gravitation, which, playing between earth and sun, becomes cognizable at the terminals as light or heat. If the sun pulls the earth from a straight line to a curve, it must exert and transform energy. What becomes of this, if it does not take the form of light or heat? I consider that the above considerations constitute a demonstration that the common radiant theory of light and heat is totally wrong. But there are others. The theory is based on the apparent heat of the sun. Is the sun hot? Scientists of renown have measured sun heat with the utmost care and reached conclusions wildly discordant from thousands to millions of degrees. Heat increases with compounding difficulties. A blacksmith reaches 1500° with ease. It is hard to force a cupola furnace to 3000°. With big engines and special appliances it may be slowly increased. With electricity, it may reach 8000°, possibly 10,000°. It is not improbable that at 20,000° all elements may be vaporized, or even dissociated. We can form no idea of what 50,000° means, or whether matter could sustain such molecular motion. To talk of 28,000,000°, is to use words without meaning. As we don't know the heat of the sun, speculations, now so abundant, about age, rate of cooling, etc., are valueless. Much more if there be no cooling whatever. Light, heat, actinism, electricity and magnetism are five different things, yet all seem to travel from the sun at same speed, under same law of square of distance, and in mathematical straight lines. Rays from different sources of light must cross without confusing. If light rays criss-cross in millions of ways, what of the superposition of four other sets of rays, beside those of gravitation, atomic attraction and repulsion, electric and magnetic repulsion, and, perhaps, several kinds of X rays? A set of atoms, vibrating in these thirteen ways, and some thousands of sets of waves of each kind, all at the same time, and keeping each absolutely and invariably separate, and all in straight lines, would be almost busy. Rather let us think that here, as elsewhere, Nature produces her results with the simplest means. We see only results. In the secret place of Nature may be only one cause, one force. In the spectrum heat rays coincide with red, and actinic with violet, (beside others beyond), and should, therefore, be of same wavelength. If waves of same length produce both heat and color, or actinism and color, or even of different lengths, what is the cause of the different results? With the blind, red color, heat and base sounds are indissolubly connected, as also cold, blue and high notes. What close connection can be shown between vibrations of 256 per second and 400 million millions per second? A slight blow on the eye produces vivid sensations of color. The whole eye must vibrate; yet to vibrate ¼-inch of optic nerve at the rate of 400 million millions times per second would require a steam engine—and a large one. There is certainly a mistake somewhere in these big figures. Prof. Newcomb thinks there is a mistake in the testimony of the spectrum as to the light of comets. Absolute cold is supposed to reign in space, that heat consists in molecular motion, and that at about 460° F. all this motion ceases. If heat travels into space, how can there be absolute cold there? If the supposed amount of heat radiates from the sun, space ought to be red-hot for a long ways around. In fact, if the sun travels 150,000,000 miles per year, it ought to leave a red-hot streak in space that long. It has not yet been shown how heat (molecular motion) can travel from a cooling planet into space, where neither matter nor motion exists. Matter is said to retain its motion until it delivers it up to other matter. How can earthly matter deliver up its motion to space if there be no matter there? If, as Thompson calculates, interplanetary matter weighs one pound to 1000 million cubic miles, how could the earth deliver daily the amount of heat daily derived from the sun to such a small amount of matter? Imagine packing the heat of 100,000 Bessemer furnaces into the hollow of a goose-quill! It is vain to attempt to escape by saying the heat just passes through this matter. If this matter don't carry the heat, what does? If it carries it, it must contain it for the time. If an atom can only get rid of its motion by delivering it to some other atom, space must be filled with matter serving no purpose except for this useless heat to travel on, or means provided for annihilating this motion,—all unsupposable. If light is material, as Crookes and others imagined, it ought to show at every reflecting surface huge effects, constantly accumulating, and its blows would destroy the eye. Heat and waves, if not of same length, at least travel from the sun with equal step. The light of a furnace travels miles, its heat rods. Why does the moon look so white and bright? Men, dirt and rock, here on earth, at any distance and in the brightest sunlight, do not look either white or bright. What legerdemain is in interplanetary distance to cause such change. The earth ought to receive eleven and a third times as much heat and light as the moon, according to surfaces; but eighty times as much according to weight. The moon, as a sphere, would reflect to the earth, another sphere, when nearly overhead, an amount of light varying within considerable limits. If we take $\frac{1}{1000}$ as an approximation the moonlight would be $\frac{1}{1000}$ of $\frac{1}{11\frac{1}{3}-3}$, say, $\frac{1}{45000}$ of the amount of the earth's sunlight, according to surface, or, if according to mass, say, one-seventh of that, or $\frac{1}{315000}$. The observed moonlight has been estimated at $\frac{1}{300000}$. To go further into this would lead us too far for this paper. A sphere reflecting light would appear bright in one spot only, and dull at edges—just contrary to the aspect of the moon which, like a flat surface, seems equally bright all over, and with sharp edges. All these things are significant, and certainly seem to show that neither sun nor planets radiate heat into space, and therefore are not cooling bodies; that light and heat do not travel, *as such*, from sun to earth, and that there must be an error in the supposed number of light vibrations per second. Vibrations of, say, 100,000 per second, would dispose of some of the above objections.

W. S. PROSSER, Civil Engineer.

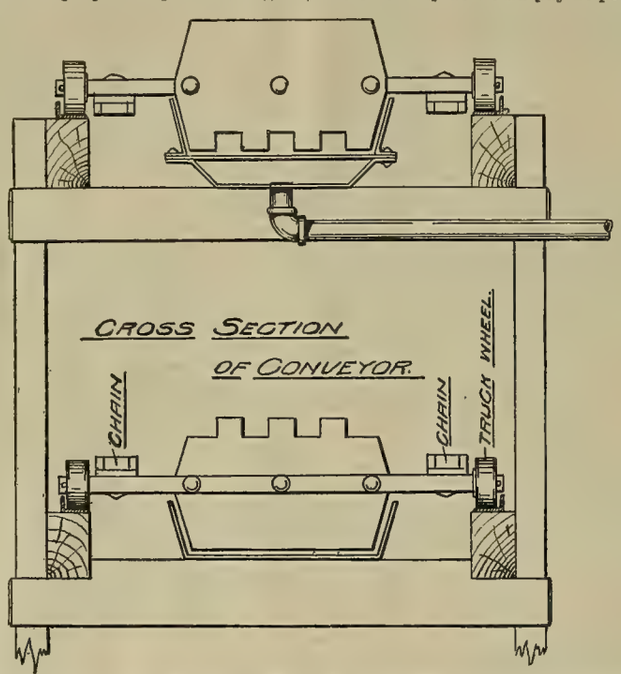
Auburn, Cal.

OUR present supply of strontium, principally employed in the manufacture of fireworks, comes chiefly from Germany. Lately it has been reported that a large bed of strontium has been discovered at Put-in-Bay island, and American manufacturers are looking for a decided reduction in price. One New York firm is said to import 150 tons of the chemical a year at 7½ cents a pound.

Proper Conditions of a Steam Engine.

In a recent paper by R. H. Thurston before the American Society of Mechanical Engineers he defines the proper conditions of a steam engine; the introduction of the steam invariably at as nearly as practicable boiler pressure; a sharp cut off; expansion along as nearly as practicable on adiabatic line, the steam being worked within non-conducting walls, if possible, ore in a jacketed cylinder, or as superheated steam, in the actual case of to-day; expansion terminating at a pressure which is the sum of the friction pressure shown as the total mean pressure of the "friction diagram" of the engine, plus the proper allowance for heat waste as above; sharp drop from the terminal pressure thus determined to the minimum practicable back pressure; maintenance to that minimum; back pressure from exhaust to the point at which compression begins; and finally, compression as nearly as practicable to boiler pressure. The "practical" limitation in each case will be found to be at such adjustment that to gain more, ideally, would cost more than the gained power or saved steam would be worth. Too large a steam pipe; costly experiments for sharpening the cut-off corner, or for other approximation to ideal conditions; too low a temperature and pressure in the condenser; such may, either or all, prove expensive methods of gaining higher "duty" of engine.

Whether the engine be simple or multiple-cylinder, the designer will seek the closest approximation to the ideal diagram, simple or combined, that he finds likely to give gains more than compensating the cost of securing them. Where the engine is designed to compete for a prescribed high "duty," the pecuniary limitation takes another form, which it is not our province here to consider, and the problem, in design, becomes that of approximating the ideal case in such manner as to attain maximum thermic, rather than commercial efficiency.



From either point of view, "drop" between cylinders is evidently not desirable, except at the point of termination of expansion in the low-pressure cylinder before condensation begins, where drop is required to the extent of the sum of the quantities; friction and cylinder condensation waste, including also, if it exists, leakage. From either point of view, also, compression to boiler pressure, with minimum "dead spaces" and minimum clearance, is requisite. In either class of engine the machine acts as a whole, and is to be treated as if the work at the crank-shaft were performed, as in the case of the multiple-cylinder engine, precisely as if it were a simple machine. When we have a variable load, the conditions differ not only from those affecting the engine under constant load, but also as affecting the two classes of engine. The problem for the simple engine becomes, in effect, the following:

Required, to secure such a design and construction of engine as will permit its operation, under varying loads, in such manner that the work performed shall always be precisely that corresponding, net, to the load imposed at the instant, and also, at the same time, so that the thermal pressure on the expansion line shall not fall below "virtual back-pressure line," as the writer has sometimes called it, computed as above. This means that when smaller loads are dealt with than that which constitutes the best for the machine as designed, a lowered boiler pressure is better than a shorter cut-off.

The problem for the multiple-cylinder engine becomes quite different from the above, for the reason, as above indicated, that the ratio of volumes of its cylinders is a fixed quantity and cannot be made alterable, as should be done if practicable with variable loads. Thus the problem involves the selection of such a ratio as will suit, not the best load of the engine, but that load which will be taken as the probably best means for the series of variations which are anticipated as characterizing the probable life action of the engine. The ratio of chosen boiler pressure to select terminal pressure ordinarily settles the total ratio of expansion and that of the cylinders, and all proportions of the engine for constant load, but this is not true when such variations of load as are daily witnessed in the operation, for example, of the power stations of electric railways. It may in this case be found that "drop" is a requisite of best mean performance, whether thermal or commercial, and new relations of expansion in cylinders in series may be best. But these are not all the new considerations coming in to complicate this question in the practical case of every-day work. It may prove so much cheaper to build, as well as to operate, an engine in which we have the equivalent, practically, of the triple-expansion engine, for example, with the intermidiate cylinder cut out, so as to make it a better dividend earner than the unmutilated triple-expansion engine. The reduced cost of construction may more than pay for the loss of efficiency, even at its best load, and with variable loads it may prove that the unorthodox form of compound may pay better than either its orthodox competitor or the triple-expansion machine. Such are the still existing problems for the designer.

Cooling Conveyor.

Herewith is illustrated a cooling conveyor brought out by the Denver branch of the Jeffrey Manufacturing Company and designed for cooling hot roasted ores preparatory to storing in wooden bins or other disposal. The hot material is conveyed through the upper run with notched scrapers to thoroughly agitate the material and expose it all to the cooling action of the water jacket which forms the bottom of the conveyor trough. After traveling the entire length of the upper run of the conveyor the cooled ore discharges into the lower run, by which it is returned, and may be drawn off into bins by slide gates suitably arranged at desired points. This device is intended to save labor and be an economizer about smelters and reduction works where it is necessary to cool the roasted ore for future handling. The same form of conveyor is introduced for drying purposes in concentrating works, the bottom of the conveyor trough in this case being made of boiler plate of sufficient strength to withstand the steam pressure used for heating. Sometimes the construction is simpler, the heating being effected by having a fire directly under the trough, dispensing with the steam.

Wastefulness of Old Machinery.

In a recent address to a society of engineers, W. Beaumont dwelt upon mechanical motive power as the greatest source of the increased prosperity of all countries during the past sixty years. The most important of all the applications of the steam engine had been as the means of transport of men and materials and as the means of obtaining material and manufacturing things which acquire their value through transport. The advances made by the introduction of the steam engine and many of the machines which followed in its wake were so great that in many industries and manufactures engineers for a generation or more were employed in construction on what have now become old and unprofitable lines. Even to-day there are in use in mills, manufactories, steamboats and railways many old well-made steam engines which are costing in fuel from 25 to 100 per cent on the outlay necessary for the introduction of modern engines. The gas engine is old enough now to make it worth while to scrap many of the earlier forms which are still working perfectly, except that they are consuming from 30 to 50 cubic feet of gas per horse power, instead of from 15 to 20.

The reluctance of the worshipping owners of old but wasteful machinery and plant is shown in many mills where twice the necessary amount of power is used for mere transmission, where two machines are employed and have to be driven to perform the work of one, where boilers are costing as much every year for disincrustation, boiler compositions, and decreased evaporative efficiency as would pay 20 per cent on the necessary outlay for condensers or for water softeners.

We see this reluctance in factories where badly balanced machinery, or machinery almost impossible of balance, is consuming a lot of power in setting up harmful and annoying vibration in buildings, and in the enormous waste of time and money by the use all over the country of double the horse power that would be necessary for cartage if anything but antiquated notions prevailed as to the construction and maintenance of roads and of the vehicles that run upon them.

We also see it in the continued use of tramways in towns, which are metallic admissions of the badness of our ordinary roads, and of the great saving that will be possible when universally good roads and horseless vehicles predominate.

The recent advances made by engineers in the different branches of the profession, and the ready adoption of many of the improvements resulting from them by our competitors abroad, are making it necessary for engineers and those who employ them to get rid of many of the old machines and methods and to give a more attentive ear to the man who can do these things, and pay less attention to the obstructive critic, whose own practical incapability leads him to prove that these things cannot be done.

Strenght of Hardened Cast Steel Spheres.

A series of experiments made with hardened cast steel spheres, to determine their resistance to crushing, is described by A. Foeppl in Baumaterialien Kunde. Tests of this kind are not easily nor usually carried out. Following is a description of the methods employed:

It was impossible to crush the spheres between the two flat surfaces of the regular testing apparatus, as no plates could be obtained which were hard enough for the purpose. Tests with the ordinary hardened steel plates would cause more damage to them than to the balls they were supposed to crush. The observations made in a former series of comparative tests of steel balls, that the same materials give comparatively higher results for smaller diameters, was substantiated in this set of tests also. An investigation into the causes for this shows that in reality the plates are tests and not the spheres, for the plates making the contact during the operation are indented to such an extent, that if sufficiently soft a hard steel ball may be embedded entirely. Results thus obtained must naturally be enormous.

To overcome this difficulty arrangements were made to test two spheres together, each being embedded carefully in plates bored out for the purpose, so that no damage could result except at the point of contact of the two spheres. This method gave reliable results, for tests made thus gave a compression of 5 to 6 tons, while a ½-inch ball of the same material, placed between hardened steel plates, ran up to 13 tons, and crushed into them one-fifth inch before breaking. The flattening of the balls was also observed, one of each pair being blackened before the test was made. By putting on constantly increasing loads, and turning the balls to obtain new contact surfaces, interesting results were obtained. As the spheres tested were not of the exact size prescribed in the standard specifications current for this work, experiments were made to arrive at comparative data. It was found that the accepted formula according to which the apparent hardness is proportional to the cube root of the radius of curvature gave concordant results. The data could, therefore, easily be calculated to conform to the standard 1.6-inch diameter sphere.

It is to be understood, however, that this applies only to the same grade of material. As there is nothing known about the relation of a cylinder to a sphere so far as their crushing strength is concerned, a series of experiments was conducted to supply this hiatus. Cylinders were cut from copper rods, spheres were turned from the same material, and both sets of test pieces thoroughly annealed. The results show that the figures obtained from the compression of spheres are two-thirds of those obtained from testing the corresponding cylinders. A series of tests of the hardened steel balls follows, the conclusion derived being that the various makes run fairly uniform, varying between 380,000 and 418,000 lbs. crushing strenght per square inch, the average being 396,000 lbs. The highest results ever obtained by the author of the paper was 483,000 for hardened tool steel. When it is remembered that excellent steel rails do not run ever 162,000 lbs., hardened steel balls are probably the best material for resisting compression now known. As a consequence, attention should be paid to the beds they rest upon when designing and constructing machinery.

A further test was made to ascertain the resistance of these hardened steel balls to impact. Suitable weights were allowed to drop from varying heights upon the balls until they broke. Each test was recorded and from the data obtained the work required to produce fracture was calculated. Finally the resilience of the material showed much greater variation than did the crushing strength under plain compression.

Mining Summary.

CALIFORNIA.

Amador.

Work at the Amelia mine is progressing, the shaft having reached 480 feet. Water is coming in fast and causing some bother.

The Anita will sink to the 1000-foot level. This necessitates more powerful machinery, which will be put up soon.

At the Amador Queen No. 1 the shaft is down 880 feet and Supt. Dye is going down until he proves his theory that depth will develop a large and paying ledge.

Davis & Marsh struck a good prospect near Butte Mountain last week.

Several men went to work at the Lincoln mine last week and things are being put in shape so that opening up the old shaft can begin at an early date. Nearly the entire 100,000 shares of stock has been disposed of.

At the American mine at a depth of 100 feet they are under a chute of ore between 200 and 300 feet in length and the ledge is 7 feet wide. The mill will start in a short time.

Sinking was completed at the Oneida mine last week to the 1500-foot level and a drift started for the vein, which it is expected will be reached in 200 feet.

The Amador *Record* says: With the Wildman-Mahoney, Baliol, South Eureka, Central Eureka, Oneida, Lincoln, American and Potazuba mines in operation and 150 stamps grinding, Sutter Creek never in her history had a more encouraging outlook for prosperity.

A. Mello, on the Silver Star mine, near Jackson Gate, is sinking a winze in the ledge at the end of a 160-foot tunnel.

Dispatch: Mrs. M. J. Hepburn of Chicago has made an agreement for the purchase of the Bellwether mine, at Jackson, for the sum of $98,600, and paid $2600 on the purchase price. Mrs. Hepburn's plans for the development of the mine are on an extensive scale.

Butte.

Gramps Bros., at Big Bar, have found a streak of pay dirt; Faley and Smith, on the North Fork, took out $97 in three weeks.

Eastman & Avery discovered a ledge half a mile east of Kanaka Peak, and are running an open cut.

At the Morris Ravine mine, fifteen men are employed.

At the Magalia sixty-five men are employed, and the mill is kept steadily running on cement gravel.

The shaft on the Emma mine, at Nimshew, has reached 120 feet.

The Princess Company is reported to have bought the Butte Queen property. Orders are said to have been received to open the Golden Summit mine, and the work of pumping will begin as soon as the machinery can be put in readiness.

The Ethel, or Wylie mine, has closed for the time being.

The John Hupp mine shows good gravel.

Good rock has been struck in the Miller mine, near Powieltown.

The Bader mine, near Oroville, is paying, and fifteen men are employed.

On the 22nd ult., in London, the Golden Feather (Ltd) was wound up, and a new company—The Magalia Con. G. M. Ltd—organized, to work the newly acquired property near Magalia. What transpired at the meeting is of interest to California miners. J. T. P. Pechly, the chairman, referring to the circular proposing the action taken, said: "It contains on the one hand a frank acknowledgment—and it is with deep regret that I have to say it—of a complete failure so far as the working of that portion of the Feather River, which we have been attacking, is concerned; and, on the other hand, a proposition, by the adoption of which, we think, we may have a fair chance of redeeming our position and retrieving the losses which we have made. Whilst we feel very sore under these losses—and on none have they fallen more heavily than upon your directors—I cannot help looking back over the past and asking myself how it is that we have been so utterly misled in all the anticipations we have indulged in with reference to this undertaking. It seems to me that the keynote of our failure may be found in the second paragraph of the circular. 'From the very commencement of operations in the Feather river the shareholders have been fully aware that the claims owned by the company had been more or less worked by the Cape and Cape Union Companies in 1857 and 1858. Up to the present, however, it has been the subject of general belief, both in California and on this side, that they had only been partially worked, and that a large amount of virgin ground remained intact.' Gentlemen, that belief is the rock on which we have come to grief. I think that it is due to you and to ourselves as directors, that we should for a moment or two look back over the past and see how we began to cherish that belief—how we came, in fact, to form this company in the first instance. I will ask your attention for three or four minutes whilst I look back to the foundation of the original company for working this enterprise. Some 45 years ago all California was ringing with the wonderful discoveries which were being made on the Feather river. The echoes had not died away even when I was mining there in 1862–64. We used to sit round our fires at night and talk of the enormous returns of gold that had been taken out of the various bars of the Feather River, and the ravines and gulches adjacent to it. The Cape Company and the Cape Union Company in 1857–58 managed, even with the primitive appliances of those days, to turn the river, and it is a matter of history that they took out enormous quantities of gold. Each year they were driven out, as we have been, by winter storms. A few subsequent attempts were made to work the river, but they all proved unsuccessful. Then came the era of hydraulic mining, when the river, which runs, as many of you know, between rocky banks 40 ft. and 50 ft. high, became entirely filled up with debris from the hydraulic mines, and that effectually precluded any possibility of working the river bed with the appliances they had then. But during all these years, between 1858 and the year when we took hold of it, a belief had gradually sprung up in California—which we know now to be utterly unfounded—that the Cape and Cape Union Companies had left a large amount of their ground untouched. The other day I turned up in my office a book published in California in 1885—that is five years before there was any idea of working the mines by English companies. I found the following passage: 'A plan has been projected for working certain deposits in the vicinity of Oroville, which if carried out will probably prove successful. It consists in the construction of an irrigating ditch of a capacity sufficient to carry the entire flow of the Feather river, at low water, from a point a point about two miles above Oroville. The water to be handled during the five summer months is from 40,000 to 50,000 miners' inches, which will be distributed over a large area of land in Butte and Yuba counties, now comparatively unproductive. Taking the water into the canal will make it possible to work several miles of the channel river, which is believed to be very rich.' * * * There, gentlemen, you have the belief which had sprung up in California at that time. Then every one of the shareholders was content to receive Mr. Hall's report. We had also a very excellent report from Mr. Hendricks, the Secretary of State out there, and another from Mr. Perkins, the ex-Governor of the State. We also had an endorsement of Mr. McLaughlin by Mr. Edison, who is well known to all of you. I was not, however, altogether satisfied with that, and I had a friend in California, a member of one of the leading firms in San Francisco, and a gentleman to whom I owe whatever success I had in life. I wrote to him, knowing that he would not put me wrong if he could help it, and here is his reply. It is dated Aug. 6th, '90: 'I think you have a good property if you can keep the river bed dry for any good length of time. The Feather river is apt to become a raging torrent in a very short time. It all depends on that. Along with some friends I was interested in an attempt to get into the gravel bed opposite Oroville. We sunk a shaft on the river margin, erecting air compressors, and thought we could, by filling a shaft with compressed air, get into the rich gravel under the river, but it was no good. We got into the gravel and found it rich in gold, but we could not keep the water out; so we lost our money.' Now, gentlemen, on behalf of your directors, I may say that we have no wish to shirk responsibility in connection with this enterprise. I have always maintained, and I do so still, that we took every step that could possibly be taken to ensure our not making a mistake when this company was formed, and we were perfectly justified—and you, too, felt at the time that we were justified—in accepting Mr. Hammond Hall's report, and in believing that there was a very large amount of this river bed which had not been worked. And there is plenty of it yet. We have 2000 feet below our foot dam, which has never been touched, and Mr. Evans thinks it is a very good piece of ground. The unfortunate thing is that the upper part of our property, which is covered by the Cape and Cape Union claims, has undoubtedly been worked. All I can tell you, gentlemen, is that our faith continued strong right up to the very last." * * *

"A proposition was made for amalgamating with the Golden Gate Co. and raising money to work their piece of the river bed, which has also never been touched. When we came to go into the matter, however, with some of the largest Golden Gate shareholders we found that they were not willing to come in. They are working a valuable property and they did not see why they should hand over two-thirds of their property to us, and at the same time be asked to find money to meet the very considerable cost which would have to be incurred in opening up the Golden Gate property. We had one or two other propositions, but nothing that we could look at until this proposition was made to us, which is referred to in the circular. You will naturally want to know something about the history of it, and why such a property is offered to us at such a low price. Mr. Harvey and Mr. Kirkpatrick, my colleagues, were out there six years ago, at the time when the Magalia property was being worked by the Magalia Consolidated Co., and they saw this incline of which Mr. Evans speaks in his report, and they saw some of the gold taken out. Three years passed by, and the property was closed down, for reasons which are also stated in Mr. Evans' report. Mr. Harvey happened to be out there again, and he thought very highly of the property; he therefore managed to acquire on behalf of a small syndicate a controlling interest in it for 4000*l*. I have seen the receipts, and satisfied myself that that was actually so. The syndicate which took it up paid 4000*l* for it, but they did nothing with it, because they could not get the remaining interest. It was only a few weeks ago that they were able to purchase the remaining interest, and so to control the whole of that property. They propose to hand it over to us for about the sum which it has cost them. I am very sorry that Mr. Harvey is unable to be here to-day owing to illness. He writes me as follows: 'I am sorry I cannot be present at the Feather meeting to-day. As you are aware, I have been ordered down here by my medical advisers through illness contracted when in California on the company's business. The property offered to the Golden Feather, Limited, I believe to be a thoroughly proved good one, and I say this from personal inspection. The members of the syndicate (of which I am one) are very large shareholders in Feathers, and have offered the Magalia mine at such a low figure as they feel sure they will get a very substantial profit from their holdings in the Feather Co.' I may tell you also that of this £5000, I believe £2500 will come back to the new company in calls on shares held by the members of the syndicate in the Magalia property. So that I do think that is a very favorable offer to make to us—to give us this property for the exact sum which it has cost them. Now I do not think you want me to say very much as to this Magalia property. Mr. Evans has given a very full and exhaustive report on it and I am sure you have all considered it thoroughly. You will notice that the report is dated two years ago. I cabled him to know if he could confirm it now, and he replies: 'I am very glad to inform you that I can confirm report Magalia Con. made by me in the year 1896. Results of recent prospecting fully warrant confirmation.' The only point I wish to notice in the report is on pages 4 and 5, where he quotes from the twelfth annual report of the State mineralogist—a perfectly independent report. He says: 'The claim embraces about 400 acres of patented ground. Several tunnels have been driven under the lava capping, reaching a distance of 1300 feet, and disclosing an extremely wide body of gravel. The pay extends throughout the gravel right up to the lava capping. The bedrock is partly slate, partly sandstone, the latter fossiliferous. To work the ground or gravels successfully a deeper bedrock tunnel is required. The present cost of extracting a carload of gravel is 40 cents, the total width of gravel is half a mile.' I think, gentlemen, that speaks for itself as to the extensive character of this property, and I am going to ask Mr. Kirkpatrick to say a word or two to you as to what he saw of the results of some work carried on at the property. He saw some wonderful returns, but we must not think that they represent the average of what is to be found there. Those of us on the Board who are not connected with this syndicate have decided, so far as our own interests are concerned, to accept this proposal to form a new company, and we are met here to give effect to it if you think fit. We have communicated with the whole body of shareholders and have received 540 proxies, representing a total of 145,423 shares in favor of the reconstruction and the purchase of the new property. I will not detain you any longer. If you decide to support us in carrying out this reconstruction, I think that we shall have a fair chance of recouping ourselves for the losses we have sustained in the past; and I am sure no one will rejoice more than I shall, for none of you can imagine the worry and anxiety that this company has been to me during the last few years. No one will rejoice more than I shall if we can make a success of this Magalia property. I have now to move that the resolutions which have been submitted to you be and the same are hereby adopted, and I shall be glad if some shareholder on the other side of the table will second the resolution, because it will be a mark of confidence in us."

Mr. Kirkpatrick said: "When I went to see this property it had been discovered about two years. It was in a flourishing condition, and there was no chance of it coming on the market. The notes that I made at that time were not, therefore, taken with any idea that it would come into the hands of the Feather Co. I drove there from Oroville—about three and a half hours' ride over an excellent road, and we reached the mine, from the lava-cap, by a mule trail some 600 feet down. At that point there is the gravel, about 4 or 5 feet thick, and from that there is 800 feet of sandstone right down in the gulch. The gulch is scooped out for about four miles from Magalia down into the plain. It is about half a mile wide, opposite the miners' house down on the gravel, and it was only discovered by an accident. The Pershbaker mine, two miles up the hill, was doing splendidly on the same gravel. It was supposed to go somewhere down the mountain, but no one could tell where. Two winters previously an immense avalanche of debris covered the face of the mountain, and 10 inches of gravel were seen on either side. Several miners immediately pegged it out, and when I was there they had driven six tunnels into the gravel and had found that it was immensely rich where they struck it; and the appearance of the gravel inside, which was really the turn of the river under the mountain, showed that it was running away from them a very considerable distance. Then they went below and ran in 1500 feet, and located the entire line of the gravel; so that there is no question that the gravel is there. The water with which they worked it, which is about 300 or 400 inches, comes within twenty yards of the mouths of these tunnels, the gulch goes down 800 feet, down which runs their sluice; then there are three boxes of about 12 feet long, then the fall and another three boxes, so that by the time it reached the bottom of the gulch every bit of the cement was broken up and the whole of the gold was saved. I saw them put in three carloads and I had the first three boxes unlocked and I took out twenty ounces of gold. Of course, it is not going to run anything like that all through when it comes to working it, but it is unquestionably enormously rich. These mines are an old river bed, and it is from them that at the present time a great part of the gold in California is got. The gulch below contains an enormous quantity of gold, which evidently came from the river, and was broken down by the gulch when it was formed many years ago. The only difficulty in dealing with a gravel mine of this sort is to get it free from water, because these drifts are practically underground drains and they take a great deal of surface water. Here you can go in at a gradient which will take out the whole of the water by gravitation, and it will not cost £2000 to get a tunnel in there. There is not another difficulty in working the mine so long as pillars are left as supports. When I left the mine I observed that they had not left a pillar all the way through, but had taken every morsel away and put in a lot of small green timber. As we came out, my companion turned to the man who was working there and said: 'You will have the whole of this down upon your heads before you are three months older, if you are not more careful. It is so rich that you are getting careless, and you will lose the whole mine.' Within three months from that time the mine caved in. You have heard from Mr. Pechey how we managed to get hold of it, in order to offer it to the Feather Co. If you agree to the proposals now before you, I think you will get a splendid return from this property. The Pershbaker mine returned over £100,000 last year, and it is only two miles higher up than we are."

Calaveras.

Prospect: The development at the Sugar Pine mine, near Murphys, is a shaft 40 feet in ore 4 feet wide. A tunnel taps the vein at a depth of 150 feet, exposing the lode 4 feet wide.

The Buckhorn is being worked with success, several crushings yielding satisfactory returns.

F. W. McNear continues operations in the Heinsdorff ranch. The shaft has reached 100 feet depth.

The Lone Star mine, after a clean-up of something over 500 cars of gravel, which resulted satisfactory, contemplates sinking a new shaft, as they struck water and more than they could handle.

Chronicle: The shaft at the Esperanza mine is down 900 feet and will be sunk 100 feet deeper before the mill is started. The lead was crosscut at the 500-foot level and found to be 63 feet with ore that would go $3.50 per ton in free gold, and sulphurets at the rate of $50 per ton. At the 700-foot level the lead was again cut and found to be a little wider than at the 500 level, with the ore increasing in value and the sulphurets of a higher grade, and at the depth of 900 feet there is still an improvement for the better. The Esperanza is the first and only mine in the extreme northern end of the county to obtain any depth. The mill will be started about the first of May.

El Dorado.

(Special Correspondence.)—The Grand Victory, I am reliably informed, on the 400-level came into a 25-foot ore body that will average $11 per ton.

The Crown Point, one and one-half miles south of Diamond Springs, and the Lone Star in the same neighborhood, have started energetic development work, under bond to a Scotch company.

The old Springfield, now known as the Union, is repeating its history. Hayward & Lane had worked this to a depth of 1700 feet, extracted several million dollars, and abandoned it. Rather recently Judge Williams and A. Harpending took this cast-off mother lode proposition, erected a 20-stamp mill and are taking out ore that runs nearer over than under $100 per ton.

The Salt Lake people who agreed to begin work before May 1st on the Pacific group have surrendered their bond.

Grizzly Flat, twenty-six miles east of Placerville, is taking on unusual activity, both in resuming work on abandoned mines and in developing new properties.

Power drills have been put in the Limpensel mine, adjoining Placerville, and sinking will go rapidly forward. The property is worked under bond by J. C. Diamond and Dr. Gehricke of San Francisco.

The Noyes property, held by W. H. Meyers under assignment from F. B. Lloyd, has been bonded to F. H. Hall of San Francisco, and active work has begun.

Placerville, March 15th, '98.

T. French of Volcanoville is taking out good pay gravel.

T. Carey, Volcanoville, is crushing some high grade ore.

Nugget: The Gopher-Boulder, at Kelsey, is running fifteen stamps and employing ten men.

J. Thorsen is opening a property at Kelsey.

Kelly & Ball, at the Big Sandy, have six men employed.

Democrat: A mill test of ten tons of average rock from the mine of G. F. Zentgraf yielded $14 per ton and sulphurets of unknown value. The rock came from a 60-foot shaft on a ledge averaging 12 inches in width.

Kern.

The *Rand* says that Lucky Baldwin will soon open his mine on Red Dog hills, between the Pinmore and Val Verde.

The new dryer and separator have been placed at the Wood concentrator at Johannesburg. The rest of the machinery will soon start on ore.

The Red Dog mill, at Johannesburg, is in operation.

The Panamint furnishes a discovery said to run $2000 to the ton. The vein is 14 inches wide.

The Butte mine at Randsburg is again producing.

The Petaluma mine, a few miles west of Randsburg, is paying well.

The Napoleon, in the Stringer district, is down 160 feet with $100 ore at the bottom.

The new mill of P. Quinn began work last week.

The Wedge is sacking $500 ore at the 100-foot level.

The Yellow Aster Co. produced last month $36,000 in gold, which makes the total product since December $67,500. They are dropping twenty-eight stamps night and day.

The Gold Point is down 100 feet and turning out good ore.

At the Comet and Star there is a quantity of ore on the dump, assaying from $8.50 to $126 per ton.

The Uncle John and Desert King are producing ore, some going $100 per ton.

The ore from the World Beater, near Ballarat, averages $30 per ton. Twenty men are employed.

A milling of sixty sacks from the Cooper mine yielded $600.

Los Angeles.

The Southwestern Smelting & Refining Co. has incorporated; principal place of business,

Los Angeles and San Pedro; directors—M. W. Clay of McElhaney, Mo.; L. W. Morgan of Los Angeles, E. H. Rose of Colton, D. T. Jackson of Kansas City, Mo.; E. H. Grunell of Riverside; capital stock, $500,000; subscribed, $300,001.

Mariposa.

The Santa Rosa mine is being worked.

The Compromise mine, being worked by the Hilliards and H. Hedges, has 400 tons of rock on the dump.

Napa.

The Redington quicksilver mine of Knoxville is shipping 100 to 150 flasks of quicksilver each month.

Sentinel: During February the following number of flasks of quicksilver were shipped from the various mines: Napa 600, Ætna 300, Mirabel 58, Great Western 30; total, 988. This is a decrease of twenty-five flasks over the previous month's shipment.

Nevada.

Herald: L. Loupe, principal owner of the Eagle Bird mine, Maybert, informed the lessees that the company had decided to pay off the liens and other indebtedness against the mine and cancel the lease. It is said the company will operate the mine, backed by Eastern capital.

Tidings: C. Rosenthal has bonded the Pine Hill mine, near Grass Valley. Hoisting machinery and a mill are contemplated.

Transcript: Development work shows good results at the Round Mountain and Comet mines. The drifts have been extended east and west and the ledge continues strong.

Tidings: One of the new mines opened up this year is the Grant, adjoining the Idaho. A 5-foot ledge has been encountered which shows a vein of 24 inches of good rock.

Herald: Work has been resumed on the Home mine. It will be operated through a drift from the 320-foot level of the Cadmus. The Cadmus mill has been running on ore from both mines.

The Nevada City *Herald* says that work was resumed at the Spanish mine at Washington last week, with P. R. Bradley, Supt.

D. Johnson is developing his claim near Washington.

D. P. Stewart has put men to work on the Donohue ledge, and intends erecting a 2-stamp mill there this season.

F. Meister has made good progress at his claim on Canyon creek and is working an arrastra.

H. S. Walters of Washington and M. McSorley are doing work on the McSorley ledge at Omega, and will build a 2-stamp mill there.

Placer.

A crushing of 100 tons of ore from the Bellevue mine at Ophir paid at the rate of $33 per ton.

Sentinel: Adams & Sprague are developing a quartz ledge between Auburn and Newcastle. A shaft has been sunk 82 feet and a drift run 14 feet. The ledge is from 8 inches to 4 feet in width.

The extension west of the same ledge is being worked by C. T. Adams. The ledge at this point averages 3 feet. A shaft has been sunk over 200 feet. At the 100-foot level drifts have been run 150 feet west and 200 feet east. From the 200-foot level the drift east has run 50 feet and the one west is in 60 feet. From a milling test the ore has returned a value of from $9 to $14 per ton.

The February statement of the Pioneer G. M. Co. shows as follows:

	February.	*June 1 to Feb. 28.*
Value of gold bars.....	$14,161	$105,488
Total expenses.....	5,823	52,563
Net income.....	$ 8,338	$ 52,925
Tons rock crushed.....	949	6,131
Av. value rock per ton..	$15 06	$17 21

Plumas.

Bulletin: G. W. Gaberel is making good progress in developing the Butte Bar mine. A quartz vein 7 to 10 feet wide has been uncovered and 2 feet of this is reported to yield good assays.

The Little California mine, six miles below Butte Bar, is running five stamps on good ore.

A. H. Rood has begun work on his gravel mine at the head of Bear creek.

Riverside.

In the Cahuilla district prospecting is lively and much development work is going on. The recent storm furnished a supply of water for the summer.

F. Dunham discovered a ledge of gold-bearing quartz on the Mojave desert, five miles north of Bagdad. The ore is free milling, running from $25 to $28 a ton, and carrying copper and iron.

San Bernardino.

J. I. Crowell of Corona, representing Eastern corporations, is said to have secured a copper deposit midway between Daggett and Randsburg, comprising 133 claims. The ore runs 17 per cent copper, about $11 gold and $13 silver to the ton. They will develop the property and erect a 100-ton smelter.

Sierra.

(Special Correspondence.)—In last week's issue appears an item from a Nevada county paper noting the recent rich find at the Plumbago mine. I am enabled to give you precise information on the subject from personal knowledge. The Plumbago mine, owned by the Crœsus G. M. Co. of New York, is generally referred to as a pocket proposition. While the property has from time to time produced rich pockets, it has, none the less, a defined 2-foot ledge in serpentine and slate walls and operates a 10-stamp mill. The mine is across the Yuba river from Moore's Flat and about five miles from Alleghany. It has produced upward of $300,000. The last find consisted principally of three pieces, the largest weighing 70¼ pounds, for which I saw a check from Selby,[1] dated March 11th, to amount of $9,582.81. The other consisted of 51½ pounds, which netted $3612.50.

California can still hold out inducements for the successful investment of capital in mining interests that are neither in snow-bound nor ice-capped regions.

Forest, Cal., March 15th, '98.

The Claybank Co. at La Porte is running the main tunnel at a rapid rate.

McMellan & Gray have started the Rising Sun mine, near Sierra City.

Shasta.

The Hedge Creek mine, near Mott, has a tunnel on the ledge 90 feet, in ore all the way. The ledge is 5 feet wide and carries from $9 to $21 in gold, some copper, and also galena and silver.

Graham and McDaniel are developing a quartz lead near Muletown. The vein shows a width of 4 feet and assays $96 in gold per ton.

L. F. Barlow, in the Summit mine at Sunny Hill, will run 300 feet of tunnel in addition to the 500 recently completed.

Desmond Bros. are pushing development work on their quartz location two miles north of Whiskytown.

A discovery is reported at the old Hansen mine on Mad Ox creek.

Williams & Winklereid have discovered a back channel gravel deposit on Mad Ox creek.

The *Free Press* says that the Old Spanish Co. will erect a 10-stamp mill on their property. Among the owners are H. Deakin and G. Taylor of Anderson. The company owns the Wiser property near Lower Springs, which consists of 160 acres, upon which there are a number of quartz leads. The company has done considerable development work.

The Central mine in the old Diggings district, under lease to R. G. Hart Sr., has closed down.

Democrat: G. McDaniels at Muletown discovered two parallel ledges, one of which is 4 feet wide and of good value.

At the "24" mine, owned by the Graham Co. near Shasta, they are running a 75-foot tunnel to tap the main ledge.

Siskiyou.

The Fort Jones *Reporter* says a pay chute has been struck in the Little Queen mine at Mugginsville. A tunnel was run in ore 100 feet. Sixty feet of it is high grade, with a vein 1 foot wide.

The heavy rain lately has afforded water for the miners along the Klamath and adjacent streams, and all the mines are running.

C. Jensen, on McKinney creek, is piping on a bank of 15-foot gravel.

Phelps, Osmond & Sperry purchased the Mullen mine, near Oak Bar, and are driving a tunnel to tap the back channel.

The American Bar M. Co., at Hornbrook, is preparing for extensive work this spring.

The Jillsen mill, at Hornbrook, shipped a $1200 bar last week.

Kingery & Hay, in Quartz Valley, continue to find good ore.

T. Austin, in Humbug gulch, is running a tunnel through the mountain on the west side of Yreka, and found several large stringers of quartz at a distance of 290 feet in the hill.

The Chinese Co. working the Benz Bar mine at Honolulu, purchased for $5000, has been taking out considerable money.

The Spengler Bros. are washing up ground left from last year's working on Humbug creek, and will not be able to do any hydraulic mining unless there is rain or snow.

Journal: The Colorado Co., working the Hegler mine, on Humbug, under option, sunk a shaft 75 feet and found good prospects.

The Boyle mine, on north fork of Humbug, will start again next month under the superintendency of J. F. Boyle.

The Wright & Co. claim at Oro Fino is working with a good supply of water.

Tulare.

The Porterville *Enterprise* says J. W. G. Forbes of Glendora is negotiating for the purchase of the Talc mine at White River. Should Mr. Forbes succeed in getting the property he will sink a shaft 200 feet deep, put up a new mill, two concentrators and a cyanide plant.

Tuolumne.

At the Belle mine, Tuttletown, drifting on the 300-foot level has been going on for three weeks past. Sinking in the shaft, which is 340 feet, will be resumed next week. Supt. Blake has commenced development work on the Mullen claim, adjoining the Belle, which was recently bonded by the Belle Co.

The Providence M. Co., near Summersville, will expend upward of $100,000 in putting in improvements, constructing roads, purchasing new machinery, etc.

On the Hiyaphoo a good ledge has been opened. Aside from the free gold it runs well in sulphurets. It is a combination milling and pocket proposition.

Thirty men are employed at the Sell mine. The new 10-stamp mill has commenced.

J. Arnold has bonded to C. L. Lang the Paduch ground, which runs parallel with the Rawhide and Rappahannock mines. Work is to start soon to open the property.

Independent: The Von Tromp, above Columbia, gives indications of worth. A 3-stamp mill was put up for prospecting. The ore is free milling.

At the Grey Eagle, near Columbia, purchased recently by the Korbel Bros. of San Francisco, the new mill has started.

The Norwegian mine, closed down several weeks ago for want of water, is again in operation. A gasoline engine supplies the motive power and twenty-five men are at work. Men are laying a foundation for compressors that are to operate power drills.

The Sonora *Banner* says another discovery has been added to the list on the east belt in the Schaffer mine. The development shows a vein 5 feet bearing its gold entirely in sulphurets, which reaches the sum of $1600 per ton.

While enlarging the tunnel at the Sell mine a body of high-grade ore was discovered.

The Grizzly mine, reopened last year under bond, is bought by the bonders and is to be developed on a large scale. The owners are mostly San Franciscans. At the first annual meeting last week W.C.Murdock was elected president, and W. E. Brown vice-president.

A 20-stamp mill, hoist, etc., will be built.

A new shaft has been sunk in the Grizzly 350 feet, and at the 200 level a drift run 180 feet. The vein is 8 feet wide and mills $8 to the ton. The board decided to continue sinking. So far about $13,000 has been spent.

At the Norwegian, worked last year with good results, work stopped Jan. 1st because of lack of water. Operations have been resumed with a gasoline engine, drills and air compressors operated by gasoline. The Norwegian shaft is down 350 feet.

The Santa Ysabel is running twenty stamps and there is sufficient water on hand to run its full number right along.

The Central ore chute is said to be especially good, while the Knox & Boyle and Mascot chutes continue about the same.

The Santa Ysabel earned sufficient to pay operating expenses while the property is in a state of development. The management expects to cut its three principal ore bodies in the 500-foot level, and reach this level within six months. It expects to reach the Nyman ore body on the second level. This ore body has been found in the adjoining property and is known to exist in the Santa Ysabel.

Yuba.

At the Good Title mine, Indian Ranch, the new incline is down 250 feet and work on new levels has commenced. The ledge at the bottom of the incline is 8 feet, and fifteen stamps are crushing, with a fairly good yield.

NEVADA.

At Elko C. Adams paid $4000 cash for one-third interest in the Gold Bug mine at Tennessee Gulch.

A Colorado company has taken an option on Weston's copper mine at Lone Mountain.

The Golden Eagle M. Co., in the belt north of Winnamuck, will have a plant for its milling ores. Two carloads of gold ore is in transit, which is the first shipment undertaken since last fall.

The Potomac shaft, near Mountain City, is down 120 feet in solid formation.

The Glasgow and Western Expl. Co. made a $30,000 payment, in advance of maturity, on the Star and Graybird mines at Cherry creek.

A trial run of the smelter at Golconda was satisfactory, and it will henceforth be in operation, putting an average of thirty tons a day into bullion and matte.

The Lyon County *Times* says W. and F. Armstrong and W. Boyce have been sued by Jane Laity of Virginia City for the possession of a mining claim in Silver City, known as the Lucky Star. She asks for a perpetual injunction and $2500 damages.

The Elko *Independent* reports the finding of copper ore near Lone mountain. The ore body is 4 feet wide, estimated to run 40 per cent. In addition to the copper, the ore carries from $12 to $40 per ton in gold and silver.

The owner of the De La Mar mine is giving 300 men employment and paying a tax on gold bullion of the net value of $2,500,000 that is produced annually from the mine.

A ledge has been found on the Golden Era mine, in Jumbo, yielding $40 in gold.

The Brodek mine, Silver City, from twenty-five tons of ore produced bullion valued at $658.03 in gold and $30.10 in silver.

The Glasgow and Western Exp. Co., operating at Cherry Creek and Golconda, have begun marketing ore, which consists of several carloads from Golconda that shows 125 ounces silver, 21 per cent lead and $7.70 gold per ton.

The Kinkead mill at Tuscarora is crushing sixty tons daily from the Dexter mine, giving returns of $26 in gold and six ounces in silver. The mill produced $13,000 in February.

OREGON.

Development in the Ashland & Mattern group, near Ashland, is progressing, thirty men being employed.

The Baker City *Republican* states that the Bonanza mine has a ledge 127 feet wide and not yet found the foot wall. There is no waste ledge matter. E. Geiser, one of the owners, says the 20-stamp mill will be increased to 120 stamps.

The Union *Republican* says that N. B. Merritt, representing the Eagle Creek D. Co. at Eagle Creek, will build a ditch three and a half miles in length to carry 1200 inches of water, with a fall of 300 feet. From the lower end of the flume a 19-inch main pipe for 250 feet to the Y, and two 12-inch pipes 1200 feet, will be laid, and two giants will be operated.

Coffman & Bristow discovered a 9-foot vein in a porphyry and slate formation near Grants Pass.

The miners at Hawkinsville have not been able to do any mining of consequence since December last for lack of rain.

On the Hedge Creek mine near Mott a 90-foot tunnel has been cut through a ledge 5 feet wide, carrying $9 to $21 in gold.

The clean-up in the Great Northern, near Canyon City, last week amounted to $2367.

The Baker City *Democrat* says the sale of the Belcher group took place last week to Salt Lake and Eastern people. H. G. Snyder has been retained as Supt. The purchasers will push development work with a view of putting a milling plant on the property early in the season.

WASHINGTON.

The Bay State, near Chevelah, sunk a 40-foot shaft and found an 8-foot vein, carrying gold, silver and copper, assaying $35 total value.

Heavier machinery will shortly be required for the Bonanza mine, near Bossburg. J. Hanleyis Supt. Announcement is made of the discovery of another large ore body on the 300-foot level.

The Gold Bug, located two miles north of Pierre's lake, reports the discovery of a 4-foot ledge.

Another strike was made in the new Eureka camp.

An 8-foot ore body of good value was opened on the Lily mine, which is owned by the Big Six Co., mostly Spokane men.

The output of bullion from the Everett smelter during 1897 aggregated 4500 tons, valued at $1,700,000.

The Le Roi smelter at Northport started the No. 1 blast furnace last week. This puts the whole plant in operation for the first time since the smelter blew in. The daily output when running full force is 400 tons per day. The mine is shipping its second and third grade ores. There are 175 men on the pay-roll.

S. H. Manly purchased a half interest in seven properties near Republic for $5360.

BRITISH COLUMBIA.

(Special Correspondence).—The Channe Co. have purchased four more prospects on Nansen island, in the Nanaimo district, and will develop them. Several claims on the west coast of Alberni were sold to English capitalists this week. Very few claims in this copper district still remain with the original holders, English and American capitalists having bonded or purchased them.

The Fern mine has had another clean-up of $12,700 and state that another dividend will shortly be declared. The Fern is a Kootenay free-milling proposition.

The Tinhorn Co., Fairview, claim that, through the errors of a former Supt., they find themselves without funds and a mine not yet in shape for cheap working. The promoters, Dier, Davidson & Russell, are giving the company 100,000 shares of their own stock to sell for the purpose of buying machinery in San Francisco for the quick development of the mine.

The Winchester Co., Fairview, is paying expenses as they proceed. They are sinking a shaft directly on the vein; the ore for 80 feet shows a high average in mill runs.

The Fire Mountain-Harrison Lake Co. have been crushing since Feb. 3. A section mill is the only kind that can be packed to the mine, so steep is the mountain. A road will shortly be built.

Vancouver, March 15th, '98.

The Brooklyn mine, near Nelson, has been bonded by W. McKenzie and others for $75,000, on which they made a cash payment of 10 per cent.

The Jubilee mine, near Ymir, has been bonded for $60,000.

W. J. Robinson has bonded the Baldwin, Harper & Holten claims in the Ymir district for $35,000.

The Boundary Creek M. Co. contemplate putting in a steam pump on their Last Chance claim in Skylark Camp.

A steam plant—hoist, pump and compressor—is contemplated on the Brooklyn, in Greenwood Camp, Yale district.

The Canadian Pacific Expl., Ltd., Rossland, intend to put in power drills and a stamp mill on the Porto Rico, near Ymir.

The Fern mine, Nelson district, will order ten additional stamps for their mill. F. C. Innes of Spokane is Mgr.

It is stated that the McKay mines, Fort Steele district, will place a 20-stamp mill on their property this summer.

The Chieftain, bonded for $50,000 to Beaven & Mackenzie, shipped three tons of ore which returned $938 per ton; the majority of it was antimonial silver.

The Promitura, bonded for $25,000 to Mr. Brody, struck the main ledge. The bonder will buy the property.

From a 6-foot ledge in the Tamarack shaft, near Ymir, a result of $16 per ton was obtained. The ore is free milling, and can be mined and milled for $6.50 per ton.

The Trail Company ratified the sale of the Columbia & Kootenay mine to the British America corporation. The company has received $50,000 on the first payment.

An English company has bonded the Bugaboo group, East Kootenay, for $63,000. A cash deposit was made.

The Le Roi mine will install three additional drills.

THE KLONDIKE.

The Treasury Department at Washington, relative to certain articles destined for the gold fields of Alaska and the Canadian Northwest Territory, has instructed collectors that the articles free of duty which may be carried by passengers arriving at Alaskan ports for such destination include all wearing apparel and other personal effects and necessary outfit, such as tents, blankets and cooking utensils intended for immediate use. These instructions are in explanation of regulations issued on February 2nd last, which were not fully understood by the customs officials in Alaska. This makes clear that those bound for the Klondike or other mining districts of the Canadian Northwest, by way of Alaska, are not required to pay duty to United States customs officials at any port in Alaska on such articles as are specified.

Letters dated February 24 from Telegraph creek, at the head of Stickeen river, report discoveries of gravel and quartz claims of good value. Thirty pounds of gravel taken from the rim of the channel yielded 75 cents to the pan. The people making the discovery have leased 200 miles on the channel of the Stickeen river.

Five men located eight quartz claims on Stickeen river, ten miles from Telegraph creek. After staking out the claims they traveled ninety miles to record their locations. The ledge is said to be 800 to 1000 feet wide, assaying from $5 to $200 per ton, averaging $20. Sample ore sent to an assay office in Seattle yielded $392 gold, $2.30 silver, while another was $4 gold, another $184, and two 40 and 60 cents per ton.

The leasers of the gravel began work at the date of writing to crosscut the channel and push development work.

UTAH.

The Mercur mine is paying $432,000 per annum on a valuation of $1,690,000, or over 18 per cent on a basis of $8.45 a share.

The *Tribune* states that with the cyanide

process at De Lamar mills, comes a fatal disease of cyanide poisoning and antimony.

Reports from the Conger M. Co. at Bingham show an average of 22 per cent lead and $4 gold per ton.

J. D. Frawley has secured a lease on the Yankee Girl at Silver City, and work will be resumed at once. The option calls for the payment of $20,000, the owners to have a royalty on all ores taken out.

The Horn Silver at Frisco employs over 150 men. Six cars of ore, silver and lead, were shipped last week.

The Golden Gate mill at Mercur cost upwards of $300,000. It will be operated by electricity and the ores will be roasted by gas, manufactured on the ground.

Recent developments in the Sacramento show four veins of good milling ore. The fourth vein was disclosed last week.

The South Swansea made a 100-ton shipment last week.

The North Star at Tintic shipped a carload of ore that carried six ounces in gold and some silver.

The Mammoth has secured a ninety-day option the New East Tintic Railway, from February 15th.

The Junction is taking out good shipping ore. The ore is a lead carbonate and the first-class runs sixty ounces silver, 45 per cent lead and $1.20 in gold.

A deed of trust has been given L. D. Thoman for $150,000 by the Asyrian Asphalt Co. on their mining properties near Provo.

Following are ore shipments from the Mackintosh sampler for last week, in pounds: Silver King, 886,960; Anchor, first-class, 65,990; Anchor, concentrates, 194,390; Ontario, 74,730; Daly leasers, 39,280. Total, 1,261,350 pounds.

The Park City *Record* says it looks as though the Alliance people would not go into the proposed consolidation, and, if they do not, the company will resume operations on its own hook. It has several thousand dollars in its treasury, and work can be commenced at a day's notice.

IDAHO.

The Horseshoe Placer Mining Co., Salmon river, proposes to turn the volume of the Salmon river from its channel at the Horseshoe bend through a neck of gravel—the cut-off proposed being about 1320 feet in length. This will expose the present bed of the river about two miles. They have commenced work.

Since his appointment as receiver of the Red Cloud claims, near Hailey, E. Wilson has paid off claims aggregating nearly $100,000. He will make his final report and ask to be discharged.

Work at the Red Cloud has been resumed. A 250-foot crosscut will be driven on the tunnel level, and future operations will depend upon the developments there.

Work is in process to dredge the deep placers near Eagle.

The Atlantic, near Wallace, came upon an ore body of good value across the entire face of the tunnel.

G. Cox, in developing the O. K. mine near Kellogg, struck 4 feet of ore, 18 inches of which is galena.

F. R. Reed has closed a deal for 570 acres of placer ground in the upper Boise. It will be worked at once.

MONTANA.

Another strike was made in the property of the Alice Mining Co. at Walkerville, at a depth of 200 feet, assays from which show 200 ounces silver and $60 per ton gold. Heretofore the ore has varied from 12 ounces in silver and $4 in gold to 100 ounces in silver and $40 in gold in this portion of the company's territory.

The strike in the Queen of the Hills, near Neihart, shows a vein 20 feet wide, 3 feet of which is high grade. The remainder of the vein is low in assay value, but all of it is ore, ranging from ten to fifteen ounces of silver per ton.

The Hope mine at Basin, which has lain idle since the fire of March, 1896, resumed operations last week. About two weeks ago a new company was organized, known as the Basin Gold and Copper M. Co., which purchased the mine for $209,000, and at once began preparations to resume working the mine. Gov. Smith is president and Mr. Hewett vice-president of the new company. Mr. Hewett says that the plans of the new company contemplate working the mine on a much more extensive scale than it has been worked heretofore. The company intends to increase the capacity of the mill from 150 tons daily to 500 tons.

The sale of the Snow Shoe mine at Libby to an English corporation for $200,000 will stimulate the mining industries of the camp. The company will build a concentrator of five times the capacity of the present one, which is of but 200-tons a day capacity. The new mill is to be built near the mouth of the Snow Shoe creek and will be furnished with tramway connections to the mine. The company will run a main working tunnel to a point about 1000 feet farther down the mountain than the present site. The present mill will be used for the treatment of ores from the upper works until complete underground connections are made to all parts of the mine. It is the further intention of the syndicate to make railway connections with the property. The Silver Cable Co. will start its new concentrator at an early date. The Cable concentrator will be run during the coming season and its capacity will be increased as rapidly as practicable with the opening up of the mine. At the beginning it is calculated to handle fifty tons daily.

About one year ago, says the *Review*, a syndicate of New York, San Francisco and Helena capitalists secured permission from Congress to dam the Missouri river at Canyon Ferry, near Helena, Mont., and work was begun at once. On February 19 the dam was flooded, and there is now being installed what is said to be, with the exception of the Niagara Falls plant, the most complete, as well as the largest, electrical plant in the country. Power will be furnished for two of Montana's largest concentrators, the east Helena smelter and the local street-car and lighting plants, and that will take only one-fourth of the power. While the dam was being flooded it necessarily left the river bottom below dry, and several miners got out their gold pans and began active operations in the river bed. In the thirty-six hours that it was dry some panned out as high as $100. Several companies will be formed to dredge the river bottom.

From Jan. 1st, '97, to Jan. 1st, '98, the Alice mine at Walkerville produced 626 bars of Dore bullion, containing in gold, at $20.6665 per fine ounce, $14,709.33, and in silver, at the standard value of $1.2929 per fine ounce, $14,-990.01, making a total value of $629,699 34. During the year the company sold 5297 625-1000 tons of ore, for which they received $269,-777.84, being an average of $50.90 43-100 per ton.

The Granite and Bimetallic properties have consolidated. The stock is to be distributed in the proportion of three-fifths to the holders of Bimetallic and two-fifths to the stockholders of the Granite.

WYOMING.

J. Gibson has secured a bond on the Gladstone mine at Atlantic City, and will begin work at once.

SOUTH DAKOTA.

The Holy Terror mine, near Deadwood, is running steadily and paying monthly dividends of $9000.

The Bismarck and Big Hit properties near Deadwood, under bond by J. Barth of Milwaukee, are working twenty-four men and milling forty tons per day from the Bismarck. The ore averages $5 per ton; there is a large percentage of concentrates running $80 per ton. A carload per week is shipped to the smelter for treatment.

Judge Amidon at Deadwood instructed the jury in the case of the Buxtons against the Golden Reward mine to return a verdict for $220,000 in favor of the plaintiff.

By the total destruction of the D. & D. smelter, which occurred last Thursday, and of which note was made in last week's issue, 400 men are thrown out of employment. The loss to the company is $230,000, fully covered by insurance. The Deadwood *Times* says it is probable that the smelter will be rebuilt.

MICHIGAN.

The annual report of the Atlantic Mining Co. for 1897 compares as follows:

	1897.	*1896.*
Mineral products, lbs	6,766,960	6,448,600
Refined copper, lbs	5,109,663	4,894,238
Total income	$574,783	$531,160
Expenses at mine	401,806	394,378
Smelt, trans	67,162	64,830
Total costs	468,969	459,208
Mining profit	105,814	71,951
Timber sales	657	3,185
Construction	49,394	46,726
Surplus	57,077	28,410
Dividend	40,000	40,000
Net surplus Dec. 31	156,362	179,285
Cost copper (ex. com.)	9 17c	9 38c
Average selling price	11 23c	10 84c

The mineral yielded about 75 51% in refined copper. The directors say: "The yield of rock was not quite as high as in 1896, and the increased quantity stamped accounts for the increased quantity of copper produced."

COLORADO.

The statement of the Gold Coin Mines Co. for the year ended Dec. 31st, '97, compares as follows with the preceding year:

	1897.	*1896.*
Tons smelting ore	1,238	1,450
Tons milling ore	30,559	19,257
Gross value	$287,848	$309,677
Mining cost	196,006	128,568
Balance	91,842	181,109
Miscellaneous expenses	53,354	70,499
Profit for one year	38,488	110,610
Sundry receipts	.....	9,819
Total net	38,488	120,429
New property purchased	10,000	.....
Dividends paid	50,000	85,000
Surplus, def	21,512	35,429
Construction	.....	23,270
Cash on hand	6,565	26,175

Development work during the year was as follows: Sinking shafts, 257 feet; drifts, 3187 feet; crosscuts, 181 feet; winzes, 137 feet; upraises, 658 feet; total, 4420 feet.

Pres. Bush says the value per ton of the ore has been less than formerly, and it has been found impossible to reduce the mining expenses for development work in proportion. The general condition of the property grew less satisfactory after the first quarter until the last quarter of the year, when an improvement was noted, the average value of the ore shipped in December being about $1 per ton higher than in November, and $2 per ton higher than in October. In the early part of December, however, a series of accidents disabled the entire motive power. This necessitated a partial shutdown of the property, although it was impossible to reduce many of the December expenses. Immediately following this a serious cave-in occurred in the 1000-foot level in the Indiana mine, the source of our best production, killing three men and injuring a fourth. This cave-in has been cleared and enough ore is being extracted to supply the Kansas mill, and further operations have been suspended until the resumption of the service by the tramway, which is promised at an early date.

Eighty men are employed at the Resurrection mine, Leadville, the monthly production being 2000 tons of ore. The Resurrection owns 450 acres.

It is estimated that 100 tons per day of high-grade lead ore is being shipped from the Weston Pass district, near Leadville.

The present output of the Ibex mine is 375 tons daily of oxides and sulphide ore.

In one day 245 tons of ore was hoisted from the Gold Coin at Victor which will average $40 per ton.

Shipments are made from the Rigi at Victor, the average of which is from three and a half to four ounces, and the ore lies in good width.

Cobb & Wilson, on the Zeolite, near Victor, are in a large body of low-grade ore and are making frequent shipments while opening up ground.

The Denver *Republican* says that the March output at Cripple Creek is running ahead of February. Surface work is being started again all over the district, and as winter draws to an end there is a better demand for leases, and the outlook for new work is brighter than it has been for months.

About forty tons of mineral per day is being shipped by the Big Six at Leadville. The ore is low grade in quality as a rule. The Stead lease at Leadville, with others on the Nisi Prius, run the shipments close to 120 tons per day. The mineral, although low grade, is a desirable smelting product.

The *Miner* says that the Idaho mine, near Silverton, is soon to be started by a new company, and that upwards of $50,000 will be expended in its development and the erection of a concentrating mill of eighty tons daily capacity.

A strike has been made on the Star of the West, at Silverton, of ore 3½ feet wide, carrying gold, silver, copper and lead, and averaging over $17 per ton.

Sanborn & Co. of the Acacia at Cripple Creek have ore aggregating 10 inches in width, giving average assays of two ounces.

The Lizzie G. at Saw Pit is producing a carload of mineral daily, which runs $40 per ton, principally gold. The ore is in a flat vein from 30 to 35 feet in width by 3 to 4 feet in thickness.

Smith & Hyatt have opened into big bodies of ore in the Waverly group, near Idaho Springs, and will begin shipments next month.

The Metropolitan adit at Idaho Springs has found some neglected ore bodies which, in addition to the gold and silver, run 5 per cent copper and 111 per cent lead.

F. Burns has made a find of a lead at Lamartine that runs $130 in gold and $12 in silver.

In sinking the shaft at the Bantsa mine, up Spring gulch, the best strike of ore ever found in that vein has just been opened. It has the appearance of being smelting ore, of sufficient width to make it a paying proposition within a very short time. The indications are that the upper part of a big ore body is being cut into.

The Joslin M. Co., sinking on the King group, near Idaho Springs, opened into 18 inches of ore that runs $80 gold and $300 in silver to the ton. The streak is 10 inches wide.

Annas & Co., in the Newton mine, have opened into ore running twenty-two ounces gold, 168 ounces silver, 20 per cent lead and 16 per cent copper.

The Victoria group at Gilpin was purchased by Pennsylvania men for $25,000. The erection of machinery and active development will be inaugurated this month. The 15-stamp mill in connection with the property is to be remodeled and concentrating tables are to be put in. A new pump will also be added. The placer ground, covering some forty acres, will also be opened.

At Lawson the Princess of India tunnel, which is driving into the mountain on the south side of Clear creek, is in big bodies of low-grade ore. It is thought that the outer edge of an ore chute is being touched.

P. C. Shull of Leadville has given instructions to begin work on the Murray property as soon as things can be put in shape. The mine had a great record for silver production in the earlier days of silver mining.

Hays & Co. have bought the Dictator mine at Lawson for $7000 and will at once sink a shaft.

On the McKinnie claims at Cripple Creek there are four producing shafts. The output from the Johnstone lease on the Republic has run from 200 to 300 tons a month for half a year.

The Mattie L. made a find of 30 inches of two-ounce ore. Last month the lessees shipped 173 tons, the last six cars of which averaged $75 per ton.

Lessees on the main shaft of the Christmas are getting out from 80 to 100 tons of two-ounce ore a month.

The Perigo at Perigo is employing forty men. Since the present operators took hold in July, '96, the main tunnel has been driven nearly 1000 feet, and at present is in over 4000 feet. The tunnel is 15 feet wide. During February the daily output reached 98⅛ tons, but this month 115 tons of ore is treated every day.

The Columbine mine, near Idaho Springs, was sold to a company and the amount is believed to be $40,000. W. E. Renshaw takes charge and begins active development. Ten claims are included in the deal.

Tin is said to have been discovered near Morrison, which Prof. Caldon says is true cassiterite—the same that is found in the Penzance mine of Cornwall.

Twenty-one lots of ore were received in one day by the Chamberlain mill at Georgetown, and during the past week the same mill paid out $12,000 for ore.

The Stephens lead mine at Georgetown has been storing its ore since Christmas and has begun to ship. Fifty tons of high-grade lead ore were shipped last week. From now on the shipments will be steady.

The Georgetown mining syndicate operating the Mascot lode are making monthly shipments which run from three to five ounces gold, thirty to fifty ounces silver and 6 to 10 per cent copper.

Nelson & Doane, Georgetown, have a streak from 10 to 30 inches wide in which the ore averages $40 to the ton.

The Clear Creek mill at Empire Station is running night and day, handling one ton of ore per hour.

The Iron City and Penn mills at Black Hawk are running full capacity, the Iron City twenty-five and the Penn forty-five stamps.

The Mason lease on Battle mountain is in a good body of ore and regular production is being made.

The old Tambourine mine in Wall Street Camp last week shipped 100 tons of ore which ran $15 per ton. They also shipped seven tons which yielded $56 per ton, and 100 pounds which returned at the rate of $1260 per ton.

The Virginius at Leadville outputs twenty-five tons a day of dry siliceous ore.

Iron shipments at Leadville have increased the present month and all the large iron and manganese producers are working full forces.

The Jolly Tar at Victor made its first shipment since the first of the year, consisting of seven cars of ore averaging $25 to the ton.

A one-fourth interest in the Jefferson was purchased by the Woods Investment Co.

Crozier & Williams, on blocks 8 and 9, at Victor, have opened a body of $25 ore at the depth of 100 feet.

Clark & Reese, on block 5, have a 3-foot vein of granite quartz, rich in synvanite.

The shipments from block 1 at Cripple Creek run $60 per ton.

The Fox lease is producing twelve tons of ore daily of an average value of $50 per ton.

Vaughn & Christian are producing an average of fifty tons a week, the ore running $80 a ton.

The Ouray *Herald* says Gen. Mgr. Hammond of the Treasury tunnel has decided to put in machinery at once for developing power. The tunnel is in 300 feet.

Ore shipped over the Rio Grande from Ouray during March amounted to 170 cars.

NEW MEXICO.

The Cochiti Co. is sinking the main shaft on the Albermarle as fast as possible; men are engaged blasting out the foundations for the reduction plant, and another force is crowding construction work. When these improvements are completed the force will be increased as fast as they can be employed advantageously in development work. Albermarle ledge varies in width from 20 to 30 feet; it towers from 50 to 150 feet above the country formation, and can be traced through the four claims forming the Albermarle group a distance of 6000 feet. So far about 700 feet of development work has been done and the depth attained is 300 feet in the main shaft. The plant for the treatment of this ore by the cyanide process will start with a daily capacity of 125 tons. The force now employed on the Albermarle numbers 300.

The Deadwood mine in Mogollon has a large ore body, which runs $16 in gold and $21 in silver ore.

Eight men are employed upon the Little Fannie, retimbering and repairing the main working shaft. Whether the mine will be operated steadily is not known. There is said to be an abundance of comparatively high grade ore developed in the mine and several responsible parties have hitherto offered big royalties for a lease upon the property.

The Confidence mine, near Grahm, is working seventy miners and supplying eighty tons of ore per day, feeding thirty stamps to full capacity.

At the Copper Queen mine the 15-stamp mill is running steadily, producing silver and gold.

The Colfax tunnel, near Elizabethtown, has reached 800 feet and cut a stringer of rich ore, 12 inches wide.

W. Armstrong, in the Columbine, in Red River district, has struck a vein of gold-bearing quartz 7 feet wide, which is said to average $17 per ton.

In and around Elizabethtown mining operations will be prosecuted with more vigor the coming season than ever before. During the coming two months several new mills will be put in on good properties, lode claims will be extensively developed and the placer grounds worked on a more extensive scale than in the past. A large amount of placer machinery of improved make has been installed the past winter and better results in saving values are expected.

Brigham & Terrett have struck good ore near La Belle and are pushing work on a shaft. The ore runs $8 to the ton.

The *New Mexican* states that the Rio Arriba Placer M. Co. closed a deal for 900 acres of placer ground on the Chama river, near Abiquiu. The Rio Arriba Co. is composed of St. Louis and Kansas City capitalists, and will push development as rapidly as men and money can do the work. J. Schreiner of St. Louis is Pres. of the company.

Cerillos *Register*: Supt. A. M. Watson of the Ortiz mine, near Cerillos, says the milling capacity of that property will be largely increased in the immediate future.

ARIZONA.

(Special Correspondence.) The Copper King of Arizona, near here, has an ore body. The company will soon let a contract for a 100-ton smelter. Another company is sinking a double-compartment shaft on a claim adjoining the Copper King property, called the South Bisbee Copper Mining and Townsite Improvement Company.

Bisbee, March 14th, '98.

The Etta mine, near Prescott, from a twelve days' run produced thirty pounds of gold.

The bonded properties in Cochise county the past few months amount to twenty. Demorest & Reider bonded the Galena Chief and Standard mines to C. S. Bosworth for $15,000. The Arizona mine in the Chiricahuas was bonded to Corbett & Wyman for $20,000.

B. Dunlap has bonded to Wilson & Bosworth one of his mines on the Grand Reef ledge for $25,000. He is developing copper claims about a mile south of the Grand Reef mine and is having them developed.

Republican: The Continental mines, a group of five claims, fifteen miles west of Globe, have been sold to the Federal Mining Co. of New York, the principal stockholder being the Old Dominion Copper Co. A large sum of money has been expended in development work. The Federal Mining Co. comprises moneyed men of Boston and New York already

largely interested in copper mining. Work was resumed last week with sixteen men. N. L. Amster is Supt.

At the Commonwealth mine, at Pearce, 104 men are on the pay-roll and $10,000 is the monthly expenditure for labor.

The Middle March Co.'s smelter in the Dragoons will blow in April 1st. The smelter is fifty-ton capacity. Thirty-two men are on the pay-roll.

H. P. Ewing has a 2-foot ledge in the Acquarius range, Mohave county, which yields three ounces gold and 20 per cent copper.

The Little Klondike, Maricopa county, was sold for $6,000.

Work has resumed on the Continental mines, Gila county. When a few feet had been driven in the lower workings oxide and native copper were encountered.

The Middle March Co., in the Dragoon mountains, Cochise county, will have a fifty-ton smelter in operation April 1st. The property has high grade copper ore. Thirty-two men are now on the pay-roll.

Casey Bros., operating at Dos Cabezas, Cochise county, bonded their group for $50,000.

On the Belle McGilroy mine, Mohave county, a shaft is down 140 feet. The average ore body goes $30 in gold per ton. Blakely Bros. have leased the mine and will put in a concentrator.

The Commonwealth M. Co.,at Pearce, ships an average of one hundred carloads of ore per month. The ore averages $20 gold and eighty ounces silver. Depth attained March 1st was 500 feet.

The Congress mine struck good ore at the 650-foot level and also on the 500-foot level, larger and richer than that they have been working for years; they have practically opened up a new Congress. They are now working to strike the ore body of the cross lead at the 1000-foot level.

The Golden Wonder mine, near Payson, found at 250-foot depth 5 feet of ore, assaying $20 in gold.

MEXICO.

Good ore has been found in the mountains thirty miles east of Casas Grandes of silver and copper and also of lime rock that will assay $75 per ton in gold. The property is near the Quadro Amigoes copper mine, south of San Pedro.

C. D. Lane is sinking a shaft on the Simpson mining property at El Oro.

C. B. Flynn of Monterey states that he sold the Alvino mine, in Durango, to an English company for $435,000 gold. The Alvino is a silver producer. The owners will put in new machinery and work the property extensively.

At La Colorado ore from the Grand Central mine is conveyed to the Amarillas mill.

At La Mina Mexicana, sixty miles from Nogales, thirty-five men are employed, and work is pushed. In February eighty tons of concentrates was shipped.

Two Republics says that among the large properties developed from an abandoned mine is the Santa Rosalia, twenty miles above Arispa. The property was bonded at $12,000, and with the expenditure of $6000 put in shape, and the first month that shipments were made $15,000 was realized, and for a year past the mine has yielded that amount every month, in addition to the accumulation of a dump that will run from $75 to $200 per ton. The ore carries gold only.

Two Republics says word is received of the burning of the Santo Domingo mine at Santa Eulalia, fourteen miles southeast of Chihuahua. The Santo Domingo is owned by the Chihuahua M. Co. At midnight the shift came out for lunch, except two Mexicans. The shaft is 1400 feet deep, timbered from top to bottom. It is supposed that the two men who stayed at the bottom of the shaft built a fire to warm their coffee, and after lunch went to sleep. This was a new shaft. The hoisting works were also destroyed. The Santo Domingo is one of the group known as the Santa Eulalia. The total loss is estimated at $250,000.

AUSTRALIA.

The Beacon mine at Bucca Creek, N. S. W., crushed last year 5980 tons for 8916 ounces, and three dividends of 6d per share each were declared, equalling £15,000.

Victoria's output of gold for the past year is 772,720 ounces. Bendigo heads the list, 200,320 ounces; Ballarat, 178,910 ounces. Returns from various gold fields throughout Queensland give a gross total for January of 49,789 ounces, which is an increase over January, 1897, of 5286 ounces.

Recently Declared Mining Dividends.

Champion, California, 25 cents per share, $8500; March 15.

Mercur, Utah, 18 cents per share, $36,000; payable March 20.

Silver King, Utah, 25 cents per share, $37,500; March 10.

Swansea, Utah, 5 cents per share, $5000: March 10.

Alice, Montana, 5 cents per share, $20,000; payable March 31.

South Swansea, Utah, 5 cents per share, $7500; payable March 21.

Elkton, Colorado, 2 cents per share, $20,000; papable March 21.

Sacramento, Utah, ½ cent per share, $5000; payable March 31.

Recent California Mining Incorporations.

Bella Josephine G. M. Co., San Francisco; capital stock, $100,000; subscribed, $50; A. Bouvier, H. G. Platt, J. A. Bouvier, R. Bayne, H. B. de Marville.

Peoria M. Co., Fresno; capital stock $10,000, subscribed $6,000; T. C. Archer, W. Helm, J. P. Vincent, C. B. Kemble, J. W. Herbert.

Coast Industrial Notes.

—Equally with gold and copper, warships are in greatest present demand.

—The Carson and Tahoe California Lumber and Fluming Company will operate this year with a full force.

—A dividend (No. 27) of 25 cents per share has been declared on the capital stock of the Paraffine Paint Co. of San Francisco, payable March 29.

—The Pacific Coast will get no river and harbor appropriations at this session of Congress, that entire matter going over till next December.

—Fascines will be used on the San Francisco and S. J. V. R. R. in crossing the tule lands near Stockton. Work on the 6000-foot Rodeo tunnel to Port Richmond, Cal., has begun.

—It is stated here on good authority that the Union Pacific is now in control of the Oregon Short Line. The Oregon Short Line carries with it control of the Oregon R. R. & Navigation Co.

—An effort is being made to amend the naval appropriation bill, appropriating $25,000 for making soundings for a cable line from the Hawaiian islands to Japan and also to Australia.

—*Two Republics* says that an electric motor plant is soon to be established near Contreras, Mexico, with a view of running a large factory. This will be the first of its kind in the Federal District.

—The Oceanic Steamship Co.'s steamer Alameda, now on her way from Australia to San Francisco, has on board $3,500,000 in gold. This is the largest amount of treasure ever brought into this port by a single vessel.

—The Union Iron Works of San Francisco offers, if required, to quickly build guns and warships, duplicate in nine months the Monterey, which took three years to build, and, if given a contract, will erect a gun plant and turn out modern ordnance.

—The Oregon and Washington wheat crop of 1897 was 35,000,000 bushels. Of this 21,000,000 bushels have been shipped from Portland and Puget Sound. Detailed shipments for the season commencing July 1st, '97, to March 1st, '98, aggregate: From Portland, 13,178,600 bushels; from Puget Sound, 7,973,762 bushels.

Personal.

S. TYACK, a mine owner of Bodie, Cal., is in San Francisco.

T. E. BERNARD is the new Supt. La Estrella mine, Sonora, Cal.

J. H. FRIZZELL is Supt. Salmon River H. M. Co., Sawyer's Bar.

PRESTON WOODS becomes Supt. Eaglebird mine, Maybert, Cal.

A. M. MCDONALD becomes Supt. Kanaka mine, Groveland, Cal.

GEO. BLAKE, Supt. Bell mine, Tuttletown, Cal., is in San Francisco.

J. MCGREGOR, owner Diadem mine, Forest, Cal., is in San Francisco.

P. R. BRADLEY succeeds D. Johnson as Supt. Spanish mine, Washington, Cal.

J. A. KOCH, a mine owner from Diamond Springs, Cal., is in San Francisco.

F. KLEPETKO is appointed Gen. Mgr. Boston & Montana S. & C. at Great Falls, Mont.

L. L. MYERS, Supt. North Bloomfield mine, North Bloomfield, Cal., is in San Francisco.

C. CLARK succeeds A. Durbin as Supt. Hastings & Poorman mine, Nevada City, Cal.

C. DOBLER, Supt. Brown Bear mine, Deadwood, Cal., has returned home from San Francisco.

C. W. GOODALE becomes Supt. Boston & Montana S. & C. plant at Great Falls, Montana.

S. C. WILMANS, Supt. Boulder mine, Shingle Springs, Cal., has returned home from San Francisco.

D. KEITH, managing owner Silver King mine, Park City, Utah, is in San Francisco en route to Mexico.

W. M. MACKINTOSH of Seattle, Wash., is in San Francisco on his return from Tuttletown, Cal., where he is developing mining properties.

J. GRUSS of San Francisco and his son, W. J., sailed the 10th inst. for Western Australia. Mr. Gruss expects to operate extensively in ore milling at Lawlors, Australia.

Commercial Paragraphs.

IT will be news to our readers, says the Denver, Colo., *Daily Mining Record*, when we announce the change in the corporate name of the Hendrie & Bolthoff Manufacturing Co. Their incorporation papers having expired by limitation, and the State law requiring a change of name when reincorporating, they have complied by changing the name to the Hendrie & Bolthoff Manufacturing and Supply Co. Few concerns in Colorado have such a record. All of the original incorporators are alive, and the stockholders and officers are the same in the new company as in the old.

THE advertisements appearing in various parts of the PRESS over the firm name of Henshaw, Bulkley & Co. will appeal to a large number of readers by reason of the comprehensive line of standard make machinery carried and the well-known standing of manufacturers represented. This firm is successor to the old house of H. P. Gregory & Co., so long and favorably known all over the coast. It is composed of young and energetic men fully conversant with the machinery business and quite alive to the up-to-date requirements of this part of the world in its line.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING MARCH 8, 1898.

600,214.—RAILROAD SIGNAL LIGHT—J. F. Bean, Martinez, Cal.

600,404.—BICYCLE—S. D. Carpenter, Spokane, Wash.

600,405.—SASH HINGE—C. J. Clarke, Oakland, Cal.

600,478.—HARNESS LOOP—R. G. Cottier, Los Angeles, Cal.

600,215.—PAVEMENT FINISH—W. E. Dennison, S. F.

600,277.—ARC LAMP—I. H. Duncan, S. F.

600,281.—STEP LADDER—Chas. Garland, Grayson, Cal.

600,492.—BOTTLE—E. Gerlach, S. F.

600,198.—ROTARY NOZZLE—H. H. Gortor, S. F.

600,224.—CAR FENDER—W. H. Heywood, Gualala, Cal.

600,225.—SAWMILL CARRIAGE—W. B. Heywood, Berkeley, Cal.

600,424.—CORK PULLER—F. L. Johnson, Valley Springs, Cal.

600,371.—ROAD AND BICYCLE—W. J. May, Tillamook, Or.

600,158.—RATCHET WRENCH—R. J. Miller, Placerville, Cal.

600,231.—SEWING MACHINE—J. H. Mooney, Oakland, Cal.

600,290.—THERAPEUTIC ECECTRODE—J. S. Muir, S. F.

600,270.—AWNING—J. J. Price, San Jose, Cal.

600,379.—CIGAR BUNCHING MACHINE—J. J. Ryan, San Jose, Cal.

600,298.—STEAM BOILER—J. P. Simmons, S. F.

600,298.—GAS GENERATOR—A. J. Tackle, Oakland, Cal.

600,326.—PLUMB LEVEL—C. Warren, Rough and Ready, Cal,

600,464.—HOLDER AND TILTER FOR CANS, ETC.—Webster & Holgee, Los Angeles, Cal.

600,394.—FRUIT CLEANER—B. B. & J. H. Wright, Riverside, Cal.

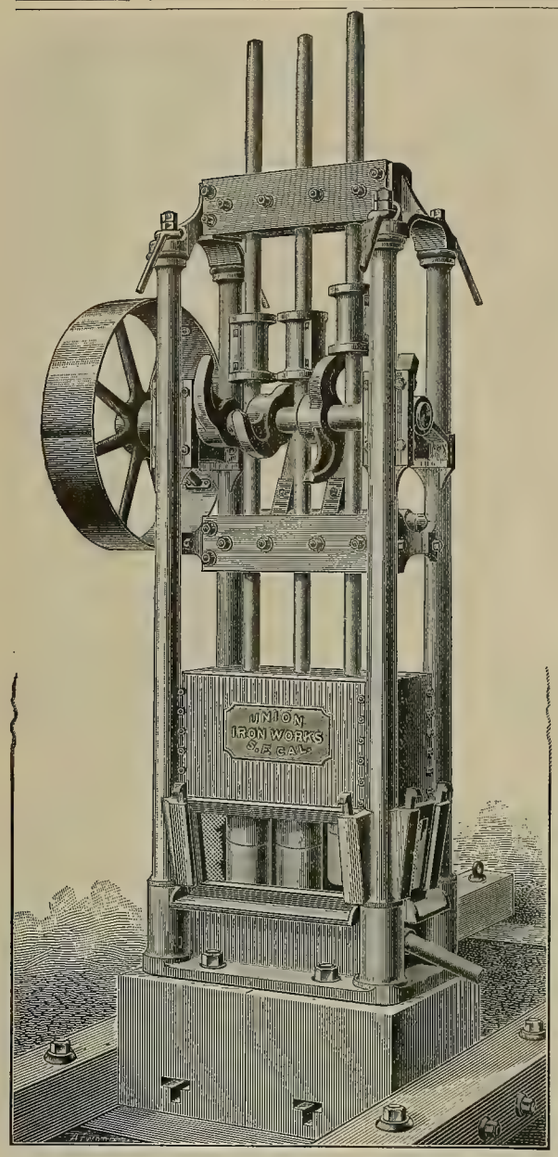
NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

CIGAR BUNCHING MACHINE.—John J. Ryan, San Jose, Cal. No. 600,379. Dated March 8, 1898. This invention relates to improvements in machines which are employed for the bunching of tobacco and forming it in shape to eventually complete the cigar. The object is to rapidly roll scraps, short or long fillers, into the binder and deliver the scraps or leaves which constitute the filler perfectly straight and parallel with each other, preventing the same from twisting or forming knots or lumps and so that the cigar made therefrom will burn perfectly even for the entire length, the bunch being maintained in a perfectly porous condition from end to end so that the draft is easy and unobstructed. In the construction of bunching machines of this class but little attention has been paid to accuracy of adjustment, and experience has shown that with the utmost accuracy the operation of bunching the tobacco will produce more or less faulty cigars. In my invention I employ a convex table, a carriage having arms pivoted upon the same common center of curvature with the table and adapted to move backward and forward over the table. A roller is journaled on this carriage and a flexible apron is fixed at the ends of the table having an intermediate loose furrow adapted to receive the tobacco to be bunched and be acted upon by the roller when the carriage is moved over the table so that the bunch will be rolled and formed within the fold of the flexible apron. With this are means for holding the ends of the apron end adjusting it so that it always remains exactly in line with the line of travel of the carriage, and means for adjusting the apron and clamping or locking it at any point of adjustment. The bearing shaft, about which the arms of the carriage are turnable, has fitted to it a closed tubular sleeve extending from one arm to the other and forming a continuous closed journal-box, which prevents grit and dirt from obtaining access to and wearing it.

THERAPEUTIC ELECTRODE.—John S. Muir, San Francisco, Cal. No. 600,290. Dated March 8, 1898. This invention relates to a novel method of constructing therapeutic electrodes for the especial purpose of introducing medicinal and chemical substances into the tissues of the human body through the agency of electricity for therapeutical effects. It consists essentially of an electrode consisting of a hollow porous cell adapted to fit the tissues upon which it is to act, said cell being adapted to contain an electrolytic fluid and having an opening through which it may be charged. A conducting rod extends axially into the cell through the closed opposite end and projects through an insulated enclosing envelope having the projecting end split, and in combination with this is an insulated handle having an interior conducting cylindrical surface which is adapted to fit and grasp the split end of the rod so as to make an electrical connection between the two. An electrical conductor extends from this interior surface of the handle to the battery or generator. The exterior surface of the porous cell may also be coated with a non-conducting substance at certain portions, leaving only a part of the cell exposed, and it may thus be adapted to act upon any limited portion of the surface with which it contacts so that the action will only take place through the uncoated surface.



FOLDING STEP-LADDER.—Charles Garland, Grayson, Cal.; one-half interest assigned to J. M. Hammonds of same place. No. 600,281. Dated March 8, 1893. This invention relates to a novel construction of step-ladder which enables it to be easily extended or folded into small compass for storage when not in use. It consists of centrally pivoted side bars crossing each other, having the ends also pivoted together in the form of what is known as "lazy-tongs." Between two pairs of these foldable sides extend the steps, which are fixed between each alternate pair of the side bars between the center and the end. Removably connected brace bars serve to hold the apparatus in its extended position, and when these bars have been detached the apparatus can be folded into very small compass. When it is extended its higher end is supported so that the steps are approximately level by means of transversely crossed standards which are adapted to hook or fit upon the upper end rod, which extends between the side bars. The construction is such that by closing the transverse pivoted supporting bars toward each other, the slotted upper ends will be brought into line with a partially flattened portion of the rod which they clasp and they can then be withdrawn over this flattened portion. When they are applied they are slipped on over this flattened portion while closed together and are then separated, the upper ends being moved outward to a point just within the side bars, and the lower ends being spread sufficiently to form a firm support upon the floor or ground.

AWNING ATTACHMENT.—J. J. Price, San Jose, Cal. No. 600,270. Dated March 8, 1898. This invention relates to improvements in adjustable awnings, such as are used to cover store and window fronts and other places and which are adapted to be unrolled or rolled up in a box above the door or window when not in use. It consists essentially of independent adjacent awnings, having a sufficient space between them to be raised or lowered independently, and in combination with these of an intermediate strip or banner having an independent roller upon which it coils, with a combination device actuating the roller and an extension fixed to the end of one of the awning bars projecting over the adjacent one and serving as an attachment for the lower end of the banner.

GAS GENERATOR.—A. J. Tackle, Oakland, Cal. No. 600,298. Dated March 8, 1898. This invention relates to an apparatus designed to produce an explosive vapor or gas from petroleum oil or volatile hydrocarbon for use in gas engines. It consists essentially of an exterior casing having a discharge pipe from the upper portion adapted to connect with the engine, a centrally disposed vertical pipe extending upwardly through the center of the bottom of the casing, through which pipe the hot exhaust products from the engine are discharged, annular cups surrounding the pipes in succession from near the bottom to near the top, an enclosing open-bottomed casing intermediate between the cups and the outer casing, a supply pipe through which oil is delivered into the uppermost of the cups and allowed to overflow therefrom successively into those below, so that it is brought into contact with the outer surface of the exhaust pipe and vaporized. In conjunction with this an air pipe extends backwardly from the bottom within the exhaust pipe so that air is introduced and heated within this pipe, and arms or branches extend through the sides of the exhaust pipe and discharge into the enclosed chamber above the oil-containing cups so that the air is mixed with the oil vapor and is first carried downwardly through the inner chamber around the cups and the mixed vapor, thence passes upwardly to the discharge pipe, which delivers it in condition for use within the engine.

AT the latest meeting of the American Chemical Society a half gallon of liquid air was ladled out of a covered receptacle packed in several thicknesses of felt, much as if it had been ordinary ice water, but on pouring it into any glass, porcelain or iron vessel it boiled with great violence until the container cooled to the temperature of the intensely cold liquid, which means about —310°F. Drops falling on the lecture table immediately took the spheroidal form and ran about exactly as drops of water on a hot stove. Placed in a glass beaker the liquid first boiled, then became clouded with a crystalline precipitate of carbon dioxide, which was present as an impurity, and from which it was separated by filtration through an ordinary paper filter, and the clear liquid was caught in a double-walled glass cylinder. The space between the walls, having been exhausted to produce a vacuum, the clear, slightly blue liquid air remained in the tube over an hour before complete evaporation. Among other experiments, alcohol was quickly frozen, rubber tubing was hardened by the low temperature so as to break when struck by a hammer almost like glass, and a piece of thin sheet iron, after immersion in the cold liquid, became very brittle.

ROMANIUM is the name given to a new alloy of aluminum with tungsten and nickel. The alloy is comparatively light and resists acid action well. It has the consistency of a good manganese bronze. It is extremely malleable. Aluminum forms 94 to 95 per cent of the alloy.

GOLD IN COLORADO!
Colorado has within its limits some of the greatest gold mines that has ever been discovered. In Cripple Creek in 1892 there were a few prospectors looking over the hills; in 1895 the camp turned out over $8,000,000 in gold. Leadville, the old bonanza camp and the mineral product of which made Denver what it is to-day, is becoming a big producer of gold. New inventions for working low-grade gold ores, together with the discoveries made to work rebellious ores, have opened up a field for the miners such as they have never enjoyed before, and Colorado has inducements to offer such as no other district in the world possesses; the record of the State in gold production for the last three years speaks for itself. Among the other prominent camps in the State are Telluride, Ophir, Rico, Silverton, Mineral Point, Durango, La Plata, Ouray, Saw Pit, Ironton, the Gunnison district and many others. New finds are being made and new camps are springing into existence every day. The Denver & Rio Grande Railroad, which is the pioneer road of Colorado and which has always been the miner's friend, reaches all the mining camps in Colorado. For elegantly illustrated descriptive books, free, of mines in Colorado send to

Assaying Gold
.....AND.....
Silver Ores.

A Standard Work.

THIRD EDITION JUST OUT.

By C. H. AARON.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the pratical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores,") that have been "successfully popular," is written in a condensed form which renders his information more readily available than that of more wordy writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:—Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assay; Examples of cupellation; Weighing of Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests of Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 126 12-mo pages, with illustrations, well bound in cloth; 1896. Price $1.00 postpaid. Sold by the **Mining and Scientific Press,** 330 Market St., San Francisco.

PATENTS

DEWEY, STRONG & CO'S PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & Co.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

THE BEST BOOKS

Are always the **CHEAPEST.** All the latest and best works on **Mining, Metallurgical, Electrical and kindred subjects** can always be obtained through the office of the MINING AND SCIENTIFIC PRESS. Below will be found a list of standard books in their various lines. If you do not find what you want in it, send for catalogue and price list of **Standard Mining Works and Scientific Publications.**

MINING AND SCIENTIFIC PRESS,
330 Market Street, San Francisco, Cal.

Assaying.—Part I—Gold and Silver Ores.

Third edition; Just Out. Rewritten and Improved by the Author, C. H. Aaron. Embraces 130 12-mo pages, with illustrations; well bound in cloth; 1896. Price, postpaid.....$1 00

Assaying.—Parts II & III—Gold and Silver Bullion, Lead, Copper, Tin, Etc.

Latest edition. Contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter. Price, postpaid.....$1 75

Prospector's Field Book and Guide.

By H. S. Osborn.....$1 50

Roasting of Gold and Silver Ores and the Extraction of their Respective Metals Without Quicksilver.

Second edition. By Guido Kustel, M. E. Contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. Price, postpaid.....$3 00

Modern Copper Smelting.

By Edward Dyer Peters, Jr. Eighth edition. Rewritten and enlarged. Profusely illustrated....$5 00

Practical Treatise on Hydraulic Mining.

By Aug. J. Bowie, Jr. On the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. Price, postpaid.....$5 00

Practical Hydraulics.

A book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers and Irrigators. By P. M. Randall. Contains useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulæ, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules and tables are prepared. Is specially applicable to the Pacific Coast. Price, postpaid, $2

The Explorer's and Assayers' Companion.

A third edition of selected portions of the "Explorer's, Miner's and Metallurgist's Companion." By J. S. Phillips, M. E. A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying and Metallurgy. Price, postpaid.....$6 00

The Metallurgy of Gold.

By M. Eissler. Profusely illustrated.....$5 00

Cyanide Processes for Gold and Silver Ores.

By E. B. Wilson, E. M. 12mo., cloth.....$1 50

Quartz Operator's Handbook.

By P. M. Randall.....$2 00

Skeleton Mining Report.

Or great practical value to miners and mine owners in making a comprehensive report on mining properties. Useful and convenient to mining engineers as a field notebook. Price, postpaid....50 cts.

Stamp Milling of Gold Ores.

By T. A. Rickard, M. E. An actual record of milling practice in this and other countries. Deals with the erection and management of mills, and contains many helpful suggestions to those interested in the extraction of gold from its ores. Well illustrated. Cloth. Price, postpaid.....$2 50

Miners' Pocketbook.

A reference book for miners, mine surveyors, geologists, mineralogists, millmen, assayers and metallurgists. By C. G Warnford Lock. 472 pages, illustrated, flexible leather.....$5 00

Manual of Mining.

For the use of Mining Engineers and Technical Schools. Treating of Preparatory and Exploratory Work, Methods of Mining, Hoisting Machinery, Pumping, Ventilation Shafts, Tunnels, Blasting, Timbering, etc., etc. By Prof. Magnus C. Ihlseng, E. M., Ph. D. Third, revised and enlarged. edition. 548 pages, 8vo., cloth.....$4 00

The Lixiviation of Silver Ores with Hyposulphite Solutions.

With special reference to the Russell Process. Second edition. Completely revised. By Carl A. Stetefeldt. Price, bound in cloth.....$5 00

Market Reports.

The Markets.

SAN FRANCISCO, March 17, 1898.

General trade is dull, but not more so than usually obtains at this season of the year. The diverting of the travel from Europe and the East to Alaska and the Northwest Territory to points up North by exceptionally low railway fares has cut off a large proportion of business which it was confidently expected would center here; yet the trade looks for quite a big business from dealers in those sections when navigation on the Yukon is open. There is a good business doing for Alaska salmon canneries, much of which is raw material and new machinery. The uncertainty regarding crops in this State and a scarcity of feed in many localities for livestock, have an unfavorable influence, as do reports of light deposits of snow on the mountain ranges for mining purposes in many districts later on in the season. So far as the writer's advices go, there is considerable activity in the gold mining districts in this State, with the outlook promising fully as much, if not slightly more, of an outturn of gold bullion as there was in 1897. A feature of the past week's exports was a large shipment (115 tons) of spelter to Calcutta for the Indian Government. This order was filled owing to the superior quality of the metal. Ship and steamboat building continues on a liberal scale in California and also up north. The majority of the vessels turned out for commission in the Alaska trade.

The local money market works on unchanged lines. Notwithstanding the fairly free export by water of Pacific coast products to foreign ports and large disbursements at shipping points by persons bound to Alaska and the Northwest Territory, the rates for exchange on New York are at a stiff premium. This can be accounted for partly by free imports of gold sovereigns from Australasia, which goes into the mint here, against which exchange is drawn on the East, and also to the many importers making their regular spring settlements at the East and abroad. The call for money with us for speculative and other purposes is said to be light. The supply of idle money in the banks is said to be largely in excess of that held at the corresponding time in 1897. The imports of gold at the East contiuue large, and this, too, in the face of a higher premium on gold at the financial centers in Europe. From February 25th last to date the imports aggregate nearly $20,000,000, and more reported coming.

New York Silver Prices.

NEW YORK, March 17.—Following are the closing prices for the week:

	—Silver in— London.	N. Y
Friday	25 3-16	54
Saturday	25 3-16	54¼
Monday	25 3-16	54¼
Tuesday	25¼	55¼
Wednesday	25½	55¼
Thursday	27 7-16	54⅝

London Bankers' 60 days	$4.82
London Merchants	$4.81
London Sight Bankers	$4.85
Refined Silver, per oz., 1000 fine	54⅞
Mexican Dollars nominal	46@—

SILVER—The New York market fluctuated up to 55¼ cents an ounce fine on Wednesday, against 54 cents on last Friday. At the close the market was easier. The London market did not advance proportionately, which shows that dealers abroad had no faith in it. It is quite hard at this distance from the field of operation to account for the advance outside of the theory that stocks are well in hand and any increase in the demand is met by an improvement in prices. The Indian crops of wheat, flax, etc., ought to begin to move in this month, and by the last of April assume large proportions, which will call for silver. This will be further enlarged when the bumper rice crop begins to go forward in large quantities. These exports are likely lo have an influence on silver. The steamer Doric, hence for Hong Kong, March 12th, took out $108,100 in silver bullion for Bombay.

MEXICAN DOLLARS—The market is very dull. Quotations are largely nominal. The steamer Doric took out only $11,240 for Hong Kong.

COPPER.—The market holds very strong. The consumption is not only very large in this country and abroad, but it promises to increase under an enlarged demand for war vessels building. England's budget calls for an expenditure of $120,000,000 in vessels and Russia will expend $70,000,000. The United States and several other countries will build additional vessels. The building will call for an enormous quantity of copper. Our New York advices state that reports of a sale of 4,000,000 pounds by the Calumet & Hecla are semi-officially confirmed. This and other sales of Lake Superior, together with other varieties of the metal, up to the 11th of this month involves at least 20,000,000 pounds for earliest possible deliveries after the opening of navigation. A Boston exchange special from New York says: "The position of copper remains decidedly strong, with market conditions fully up to the highest levels since the present upward movement began. Twelve cents is now an inside price for Lake, and some special Western and Eastern deliveries are reported at a little over this figure. Sellers continue indifferent, with some declining to offer anything for delivery during March or April. It is said that the demand may run ahead of production. Certainly present production is absorbed so quickly that copper producers have no occasion to worry about a ready outlet for all their product."

Our market is quoted as follows:

Ingot casting, jobbing	13¼@—
Ingot " wholesale	13 @—
Sheet copper	16¾@—
Bolt	¼ and 5-16, 20c; ⅜ and larger, 16¼

TIN.—Imports the past week aggregate 865 ingots from Australia. The market is slightly easier for ingot. In plate the market is largely go-as-you-please, with cutting the order.

The market is quoted in jobbing lots as follows:

Pig	4 75	@	5 00
Sheet	....	@	6 50
Pipe	5 30	@	5 80

LEAD.—The market is easier, with reports current that smelters in the Central West are willing to cut under quotations to place liberal quantities. The consumption in this country is only normal.

Pig, per lb., jobbing		—@	15
Plate, I C coke, heavy, per box	$4 10	@	4 25
" " " light, "	4 00	@	—

SHOT.—Our market is quoted as follows:

Drop, sizes smaller than B, per bag of 25 lbs	$1 35		
Drop, B and larger sizes, "	1 60		
Buck, Balls and Chilled, do. "	1 60		

QUICKSILVER.—Exports the past week aggregate 505 flasks to the west coast of Mexico. The market is steady at current quotations.

Our market is quoted at $40 for domestic consumption and $36@37 for export to the west coast of Mexico.

IRON.—The large orders that are being placed for war vessels and merchantmen in the old country and also in the United States will call for increased quantities of iron. The markets at the East and on this coast are practically unchanged.

COAL.—The market is unchanged. The demand is slow for all kinds. Stocks of some grades are accumulating.

POWDER.—The market is quiet but firm. The Santa Cruz factory is still running on government orders.

The market is quoted as follows for Hercules: No. 1, from 11¾c to 17½c, according to strength and quantity; No. 2, from 9c to 11c, according to strength and quantity.

PLATINUM.—The market is steady. Our market is quoted in a jobbing way at $16 per ounce and for scrap $11 per ounce.

ZINC.—The market is steady. Our market is quoted at 10@15c, according to thickness.

ALUMINUM.—The market is steady. We quote in jobbing lots at 45@50c per pound for ingots.

BORAX.—The market is strong at the recent advance.

The market is quoted as follows:

Refined, in carload lots, in barrels	7¼
Refined, in carload lots in sacks	7
Powdered, in car lots, in barrels	7¼
Concentrated, " in sacks	6¾

Chemicals.

There is absolutely nothing new to report in our market. The demand is only fair. Our New York advices report: "A quiet condition of affairs is still being experienced in the market for all lines of chemicals and acids. Liberal deliveries on former contracts are taking place, and, in connection with current new business, involved a large amount of goods."

CYANIDE OF POTASSIUM.—The market is steady. Our market is quoted for chemical pure, 32 cents per pound for jobbing lots, and 29 cents for carloads.

SULPHURIC ACID.—The market is firm. We quote in a jobbing way at 1½c per lb for 66°.

NITRIC ACID.—Our market is reported steady from store at 6¼@7c per pound in carboys.

BONEASH.—There is a good demand for export. Our market is quoted in a jobbing way as follows: Extra, 4c a pound; No. 1, 3½c; No. 2, 2½c.

BLUE VITRIOL.—Our market is steady. We quote in a jobbing way at 4c per pound.

SPELTER.—A shipment of 115 tons was made this week to Calcutta. The price at which it was sold is kept secret.

We quote our market in a jobbing way at 5c per pound.

BISMUTH.—The market is firm.

Our market is quoted in a jobbing way at $1.40 a pound.

SODA ASH, 58% (Le Blanc process).—The market is steady at $1.55 per 100 lbs. in a jobbing way.

CAUSTIC SODA, 60%.—The market is steady at 3c per pound in a jobbing way.

HYPOSULPHATE OF SODA.—The market is quiet at 2½c a pound from stores.

NITRATE OF SODA.—Our market is quoted from store at 4c for 95%.

PHOSPHORUS.—The market is steady.

We quote in a jobbing way at 70@75c per pound.

Mining Share Market.

SAN FRANCISCO, March 17, 1898.

Business on the two exchanges continued dull the past week, although crossorders were largely in evidence in some of the shares so as to promote a higher range of values. This advance was looked for by the street, on reports there would be a small advance, to be followed by another decline. As there are so few outsiders trading, it would seem as if the manipulator for the moneyed pool gives out the correct moves, so as to let them make, by which other and "larger game" can be induced to come into the speculative arena. Occidental made a steady move up, leading in the advance, which was taken up by Chollar, with Potosi a strong second, and these in turn was closely followed by Sierra Nevada, which caused the entire line to firm up. The advance in Occidental seems to be based on merit. There can be no doubt that large quantities of ore are being developed, and of sufficient value to admit of extracting and milling so as to pay dividends. The belief with the better informed prevails that both Standard and Occidental will pay dividends and for many months to come after they commence. The advance in Chollar is on reports that a 4-foot vein of good ore has been struck on the upper levels. Potosi is running for the same. Aside from this, they are getting in position, provided the share market justifies it, to commence very interesting and important work on or about the 1100-foot or 1200-foot level. Then the work in Potosi on the Brunswick lode grows in interest. The advance in Sierra Nevada is said to be on news from the mines and the work getting in position when it can be done to much better advantage. This mine ought to be on a paying basis. Notwithstanding the market has moved up slightly, yet prices for some of the shares are below what they should sell at on merit and at which they will sell before four months pass unless the moneyed pool has work in the mines changed so as not to make an ore development. Any advance in these particular shares will cause the entire line to appreciate. There never has been a time when the Comstock mines were worked out, and it will be many years yet before the possibilities of the mines will be exhausted, for there are large areas of ore that can be extracted and milled at a profit, and there is virgin ground above and below the center level in which one or more large bodies of ore may be struck and developed. The history of Comstock mining shows that unlooked-for surprises are liable to occur at almost any time.

At a meeting of the directors of the Gould & Curry Mining Co., a resolution was passed to commence work on the Comstock tunnel level in the north drift run in the Savage ground years ago; to extend it into Gould & Curry, so as to exploit that mine on that level. It is well known that $40 ore was found in the drift, and if this should develop into a good sized body in Gould & Curry it would be quite a factor in renewing more active work at that depth by other companies on that lode. The officials of the company are in negotiation with Mr. Leonard, President of the Comstock Tunnel, for necessary facilities to work the mine on that level, and as it is to the tunnel company's interest to have it done, there can be no doubt of favorable action.

Official letters filed the past week, combined with the movement of the shares, centers attention largely on the work in Chollar and Sierra Nevada on the Comstock and Occidental on the Brunswick; yet the work in two or three others is quite important. In Utah they are still drifting in a northwest direction. No change is reported in the material encountered. In Sierra Nevada they are driving west in the Riley tunnel and at the same time upraising from that level. The general condition of the mine is said to be looking well. On the 900-foot level they are still drifting north. They are making fair progress in No. 2 west crossdrift in Union from the top of upraise from the 900-foot level. In Ophir fair progress is reported in west crossdrift No. 3 on the 1000-foot level and in the west crossdrift on Central Tunnel level. The face of both crossdrifts is in mineralized quartz giving low assays. In justice to shareholders the drill should be used to find out what is ahead. There is no change in the work in Mexican or in the material encountered. In Andes they are working to get a strong circulation of good air, so as to exploit to better advantage. No change is reported in the joint work to the east by Gould & Curry and Best & Belcher on the 800-foot Bonner shaft level.

No work outside of jawbone is being done by the Hale & Norcross people. Good progress is being made in repairing the main west crossdrift in Savage on the 130-foot level. The official letter from Chollar says that on the 100 level, 60 feet south of the north upraise, the crosscut to the west is out 81 feet, advanced 11 feet during the week; face in old ground assaying from $6 to $8 per ton. East of the old fillings is a width of 4 feet of ore assaying $55 per ton. They have put in a square set and started north and south on this ore. So far as we can learn, mining men do not think much of the strike, yet there is no telling what it may lead to. Fair progress is being made in retimbering the main incline. Joint work by Potosi and Bullion is confined to running a south drift from the tunnel level and cleaning out and repairing the old Crœsus shaft. As a time-killer the Alpha management can discount any other management. The official letter says they are repairing the west crossdrift, which was started a short time ago. The joint work by Con. Imperial, Confidence and Challenge is practically unchanged. The strong flow of water indicates that they are near a ledge. No news is allowed to leak out regarding work or contemplated work in Yellow Jacket. Crown Point and Belcher west crossdrift from the 850 foot upraise is being pushed slowly ahead. Fair progress is being made in the east crossdrift on the 1200-foot level in Belcher. If the work is not stopped they ought to strike gold-bearing ore assaying over $40 a ton some time within the next ninety days. They extracted and raised last week forty-two tons of ore assaying $21.31 a ton, but from what level the letter does not report. They are extracting a few tons of ore in Seg. Belcher. The most of the work in Overman is dead work, preparatory to more active exploiting. They are driving ahead in the north drift on the 900-foot level. They are making fair progress in the incline upraise from the 1100-foot level in Caledonia. The top is in low grade quartz. In Justice they are sinking a winze in the ore reported recently.

From the Brunswick the most important item is that in Potosi they are sinking on the 35-foot body of low grade ore found to the west, as reported in last week's issue. In sinking they may get higher grade ore. It is the intention to run a drift from a lower level so as to connect with the winze, which will give a good circulation and admit of work lower down. The joint shaft No. 1 will soon be down a sufficient depth to admit of starting a south drift on a lower level. The Chollar letter reports that the shaft was down 1124 feet on March 11th. Active work is reported in Occidental on the 550-foot to the west; to the east and also to the west on the 650-foot level. The east crossdrift is reported in the ledge. The west crossdrift is in fair grade ore. Fair progress is being made in north lateral drift on the 750-foot level. The joint work by Con. Virginia, Gould & Curry and Best & Belcher is confined to sinking the shaft, running a south drift on the 600 level and a west crossdrift on the same level. In

Assessment Notices.

MARGUERITE GOLD MINING AND MILLING Company.—Location of principal place of business, San Francisco, California; location of works, Auburn, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 19th day of February, 1898, an assessment (No. 9) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 237 12th street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 6th day of April, 1898, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 2nd day of May, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

F. METTMANN, Secretary.

Office—237 12th street, San Francisco, California. Office hours from 5 to 6 o'clock P. M. The Secretary will also receive payments from 1 to 4 P. M. at his business office, 225 Sansome street.

NORTH BLOOMFIELD GRAVEL MINING COMpany.—Location of principal place of business, San Francisco, California; location of works, North Bloomfield, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Directors held on the 25th day of February, 1898, an assessment (No. 50) of 25 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 24, 320 Sansome street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 6th day of April, 1898, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on WEDNESDAY, the 27th day of April, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

H. PICHOIR, Secretary.

Office—Room 24, 320 Sansome street, San Francisco, California.

BEST & BELCHER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia District, Storey county, Nevada.

Notice is hereby given that at a meeting of the Board of Directors, held on the eighth (8th) day of March, 1898, an assessment (No. 64) of twenty cents (20c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the company, room 33, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the twelfth (12th) day of April, 1898, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the third (3d) day of May, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

M. JAFFE, Secretary.

Office—Room 33, Nevada Block, No. 309 Montgomery street, San Francisco, California.

RICHMOND GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Butte County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 2nd day of March, 1898, an assessment (No. 2) of 1 cent per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, room 406, No. 328 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 9th day of April, 1898 will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 2nd day of May 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

L. R. TUTTLE, Secretary.

Office—Room 406, No. 328 Montgomery street, San Francisco, California.

ANDES SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia City, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 7th day of March, 1898, an assessment (No. 46) of 5 cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, room 24, Nevada block, 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 11th day of April, 1898, shall be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on THURSDAY, the 28th day of April, 1898, at 11 A. M., to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

JOHN W. TWIGGS, Secretary.

Office—Room 22, Nevada block, San Francisco, California.

CONSOLIDATED CALIFORNIA AND VIRGINIA Mining Company.—Location of principal place of business, San Francisco, California; location of works, Virginia Mining District, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 8th day of March, 1898, an assessment (No. 11) of 25 cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, room 59, Nevada block, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of April, 1898, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 3rd day of May, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

A. W. HAVENS, Secretary.

Office—Room 59, Nevada block, San Francisco, California.

MARINA MARSICANO GOLD MINING COMpany.—Location of principal place of business, San Francisco, California; location of works, Sunny Hill, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 5th day of March, 1898, an assessment (No. 13) of 3 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 217 Sacramento street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 11th day of April, 1898, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 2nd day of May, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

CHARLES BOVONE, Secretary

Office—217 Sacramento street, San Francisco, California.

GOULD & CURRY SILVER MINING COMPANY. Location of principal place of business, San Francisco, California; location of works, Virginia, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 16th day of March, 1897, an assessment (No. 83) of 15 cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room No. 68, Nevada block, No. 309 Monigomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 19th day of April, 1898, shall be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 10th day of May, 1898, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

ALFRED K. DURBROW, Secretary.

Office—Room No. 68, Nevada block, No. 309 Montgomery street, San Francisco, California.

BALIOL GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Sutter Creek, Amador County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 26th day of January, 1898, an assessment (No. 2) of 30 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, room 7, fifth floor, Mills building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 4th day of March, 1898, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 28th day of March, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

R. L. CHENEY, Secretary.

Office—Mills building, room 7, fifth floor, San Francisco, California.

POSTPONEMENT.

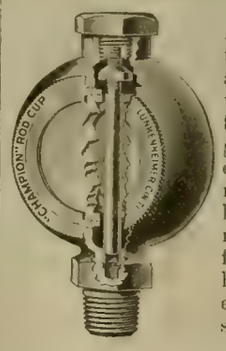
By order of the Board of Directors of the Baliol Gold Mining Co., the day of delinquence in the above assessment notice has been postponed to March 25th, 1898, and the day of sale to MONDAY, April 18th, 1898. R. L. CHENEY, Secretary.

Office—Room No. 7, fifth floor, Mills building, San Francisco, California.

KATE HAYES MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, North San Juan, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 25th day of February, 1898, an assessment (No. 6) of one dollar ($1) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 24, 320 Sansome street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 5th day of April, 1898, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 26th day of April, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.



By order of the Board of Directors.

H. PICHOIR, Secretary.

Office—Room 24, 320 Sansome street, San Francisco, California.

·. Lunkenheimer's .·

"CHAMPION" ROD OIL CUP.

A truly perfect cup and absolutely reliable at all times. Suitable for all movable bearings. Simple and practical in construction, easily filled, and provided with a perfect feed adjustment. We solicit from users a trial of this ingenious cup, and can guarantee it to be the simplest and most economical oiler for movable bearings now on the market. Made in four sizes, holding from 1¼ to 12 ounces of oil. Our name on every article is a guarantee for superior merit. Specify "Lunkenheimer" make. Supplied by dealers everywhere. Write for catalogue of steam specialties.

WEBER Gas and Gasoline Engine Co.,

430 S. W. Boulevard.....KANSAS CITY, MO.

THORPE MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Fourth Crossing, Calaveras County, California.

Notice is hereby given, that at a meeting of the Board of Trustees, held on the 19th day of January, 1898, an assessment (No. 9) of 2½ cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 44, Phelan building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 26th day of February, 1898, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 21st day of March, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

A. F. FREY, Secretary.

Office—Room 44, Phelan building, San Francisco, California.

POSTPONEMENT.

By order of the Board of Directors, the day of delinquence in the above assessment notice has been postponed to March 12th, 1898, and the day of sale to MONDAY, April 4th, 1898.

A. F. FREY, Secretary.

Office—Room 44, Phelan building, San Francisco, California.

DELINQUENT SALE NOTICE.

FALL RIVER CONSOLIDATED GOLD QUARTZ Mining Company.—Location of principal place of business, San Francisco, California; location of works, Plumas County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 1) levied on the 15th day of January, 1 98, the several amounts set opposite the names of the respective shareholders, as follows:

Name.	No. Cert.	No. Shares.	Amt.
L. Cassel	42	500	25 00
L. Cassel	46	750	37 50
L. Cassel	48	2	10
N. W Brunning	49	1,000	50 00
J. Pilger	61	1,250	62 50
H Meyer	26	1,111	55 55
H. Meyer	27	1,111	55 55
H. Meyer	28	1,111	55 55

And in accordance with law, and an order from the Board of Directors, made on the 15th day of January, 1898 so many shares of each parcel of such stock as may be necessary will be sold at public auction, at the office of the company, 313 and 315 Front street, San Francisco, California, on THURSDAY, the 21st day of April, 1898, at the hour of 3 o'clock P. M of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

ADOLPH LORSBACH, Secretary.

Office—313 and 315 Front street, San Francisco, California.

NOTICE OF ANNUAL MEETING.

MAMMOTH GARFIELD GOLD MINING COMpany.—Principal place of business, 120 Sutter St., San Francisco, California; works, in Old Diggings Mining District, Shasta County, California.

In accordance with the by-laws of said company, the annual meeting of the stockholders of the Mammoth Garfield Gold Mining Company will be held at the office of the company, rooms 50 and 54, 120 Sutter St., San Francisco, California, at 2 P. M., on Tuesday, the 5th day of April, 1898.

SAM. W. CHEYNEY, Secretary.

Dated March 14th, 1898.

DELINQUENT SALE NOTICE.

THORPE MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Fourth Crossing, Calaveras County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 9) levied on the 19th day of January, 1898, the several amounts set opposite the names of the respective shareholders, as follows:

The Huntington Mill is so well and favorably known among mining men throughout the world that any description of it would seem superfluous. They are in use in the United States, Canada, Mexico, Central and South America, Australia, China, Japan and South Africa—in fact, wherever mines exist, and have given the best satisfaction of all quartz-crushing mills. The construction of this Mill has lately been much improved and we claim it to be the cheapest, most efficient, simplest and most durable Mill upon the market. Catalogue upon application.

MELONES HOIST, CARSON HILL, CAL.

THE FORD MINE, SAN ANDREAS, CALAVERAS CO., CAL.

Calaveras Co., Cal., Mines.

Calaveras county made a notable exhibit at the recent mining fair in San Francisco, and published a handsome pamphlet on its principal mines. In the present crazy rush to the Klondike men are apt to forget what they are leaving behind them, and to ignore the homely fact that the same money and effort they will waste in the frozen north would win wealth in sunny California. In Calaveras county are some of the greatest gold producers of this State, and as in other counties in California, the greatest of all, the Utica with its regular continuous yield of $200,000 per month, is "an old abandoned mine," believed to be "worked out" a generation ago, but pushed to deeper levels proved to be worth four times as many dollars as it cost cents to buy and develop it. Herewith are depicted some typical local mining scenes.

TWO INTERESTING FACTS.

In all the States of the Far West and the Pacific Slope, consisting of California, Oregon, Washington, Idaho, Montana, Wyoming, Colorado, New Mexico, Arizona, and Utah, the largest circulation credited to any publication devoted to engineering and mining is accorded to the MINING AND SCIENTIFIC PRESS, a weekly, published at San Francisco, Cal.—*American Newspaper Directory.*

Among the engineering and mining papers in California, none has credit for so large a regular issue as is accorded to the MINING AND SCIENTIFIC PRESS, published weekly at San Francisco. In fact, it fully equals five times the combined issue accorded to all the others.—*American Newspaper Directory.*

TABLE OF CONTENTS.

ILLUSTRATIONS.—The Esperanza Chlorination Works, Calaveras Co., Cal.; The Utica Hoist, Calaveras Co., Cal.; Melones Hoist, Carson Hill, Cal.; Incline at the Melones Mine, Calaveras Co., Cal.; The Ford Mine, San Andreas Calaveras Co., Cal., 337. A New Short Beam Assay Balance, 344.

EDITORIAL.—Calaveras Co., Cal., Mines, 337. Some of the Questions Asked, 338-339. Miscellaneous, 339.

MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 345-46-47.

THE MARKETS.—Eastern and Local Markets; Mining Share Market; Sales in San Francisco Stock Board; Notices of Assessments, etc., 362.

MISCELLANEOUS.—The Kern River Electrical Enterprise; The Witwatersrand Banket, with Notes on Other Gold-Bearing Pudding Stones; Antimony, 340. Preserving the Forests: Oonness on Cams; New Danger Signal; Gold Deposits, Geology and Geography of Alaska, 341. The Use of Oregon Pine in Mining Operations, 342. Concerning Certain Physical Theories; Recent Additions to the Collection of the California State Mining Bureau; A Colorado Compliment, 343. How Armor Is Made; Ignoring a Few Simple Rules; Perchoid; Sharpened Oval or Rounding; Calcium Carbide; Earliest Miners and Metal Workers; Correspondence Schools Car; Interurban Electric Railroad Line; Not Authentic; A New Short Beam Assay Balance, 344. Coast Industrial Notes; Personal; Recently Declared Mining Dividends; Recent California Mining Incorporations; Commercial Paragraphs; List of U. S. Patents for Pacific Coast Inventors; Notices of Recent Patents; Books Received.

PRESENT gold imports are noticeable. At San Francisco have arrived in the last eight months over $15,000,000 gold, mostly in English sovereigns. The incoming Sydney steamer has £500,000 on board. New York City imported $23,625,000 in gold from England and the Continent in the twenty days from February 25th to March 16th, inclusive. The House Committee on Coinage, Weights and Measures has favorably reported a bill permitting the Secretary of the Treasury to receive deposits of foreign gold coins and pay therefor its bullion value without previous melting, and, upon demand, to furnish such coin for export in exchange for United States gold coin. The present law prohibits the withdrawal of foreign gold coin from the Treasury until it has been remelted and stamped with the eagle.

AMONG those who remember is noticeable the similarity between the attractive stories of gold discovery in the Klondike in '98 and in California in '49; the same dry river beds holding large nuggets; the same mysterious valley where hatfuls of gold could be secured; the same astounding good fortune of the inexperienced man who made a fortune in a week. The old hoary lies lure in '98 as they did in '48: the difference is that California was so rich in gold that it was difficult to concoct a fable that was not made fact by subsequent events, and that its soil and climate compensated for any disappointment in gold seeking. Another similarity is that, as in the early rush to California, all kinds of crazy craft are being started, and all sorts of inferior supplies proffered Klondike pilgrims. The greed of commercial selfishness is manifest in rotten hulks, over-crowded vessels, putrid food, incompetent crews. All this was a dreadful part of the story of '49. It is already a record of the rush of '98. There are reputable men in the business of carrying passengers to the North and there are honest purveyors of supplies. Several fine vessels have left San Francisco for Alaska and several more are building. But parasitic on this whole business is a lot of conscienceless creatures who, taking advantage of the prevalent silliness among those unfortunates afflicted with the gold craze, promise more than they intend to perform and increase the perils of a dangerous trip by taking money for risky transportation and unwholesome provisions.

[illegible]le of the Questions Asked.

Every week a great many inquiries on a great many subjects are received and answered in this office, it taking one man's entire time to give personal attention to these matters, the questions being usually answered by mail. It is interesting to note the variety of topics upon which information is asked. While in every case endeavor is made to be prompt and accurate, yet in many instances it is obvious that the questions involve the possession on the part of the answerer of a greater amount of information than is ordinarily possessed by any one, in or out of the office of a technical journal. While it is gratifying of course to any paper to be credited with the ability to furnish any kind of information, on mining or industrial topics, nevertheless, it must be confessed that the honor is not wholly deserved, and that it is sometimes impossible to give satisfactory answer to the inquirer. Just to illustrate the nature and scope of these questions which are asked and answered privately through the years, a few of this month's are herewith given:

A pulley is 16 inches in diameter, the rim traveling at the rate of 180 miles an hour. It has twelve spokes 6 inches long and 1 inch wide, the shaft being 1 inch in diameter and allowing twenty pounds for friction. What will the resistance of friction and the air be on this pulley in H. P. running at the above given rate, also at 100 miles an hour?

The above, from Loyalton, Cal., was shown to an expert in his line in this city, who said just what it was expected he would say, namely: "Your inquirer has omitted the exact details of the pulley. He should furnish width, face, and thickness of rim, all the dimensions of the spokes, with a sketch."

A man writes from Independence, Colo.:

Tell me by letter (not through your paper) whether it would be possible to sink a shaft and drift under the river instead of wingdamming. Has this ever been tried?

A long article on river mining in the issue of the 19th inst. comes very near answering these questions. The method suggested by the Colorado correspondent has been tried repeatedly in California, and sometimes with satisfactory results. In general, sinking a shaft in solid ground out of the reach of high water, and placing therein a hoisting and pumping plant, then drifting out from the bottom under the flowing river into pay gravel, which is then taken out through the air shaft, has been moderately successful in a few instances where very deep ground had to be bottomed. It is considered next to impossible to keep the underground works from being drowned out or caved in, for a river bed, with its quicksands and loose gravels and boulders, is very unstable and unsafe to work under. In general, the idea is to be condemned, and if the Colorado man concludes to try it, it should be with the utmost caution, so far as personal safety is concerned, and with entire disregard of consequences or possible profit.

Another writes that he wants full information regarding, first, "the experience of engineers who make a business of examining mines and prospects; and, secondly, what per cent of mines has turned out good and what per cent poor that have been examined and passed upon by men of experience and reputation." The MINING AND SCIENTIFIC PRESS pays good prices for valuable technical articles, and would willingly pay $100 for a complete, authentic and satisfactory article in answer to the above question. As will be observed, it involves the entire theory and practice of mining and practical results therefrom.

A Rossland, B. C., correspondent says he wants to know "how to keep timber for underground use from decaying."

Where timber wets and dries it is hard to preserve it. Several methods are in use for the preparation of timber for underground use where desired to be preserved from decay. The creosote process is probably the best. The wood is placed in an air-tight tank, a vacuum formed, and creosote pumped in at a pressure of 150 pounds per square inch, at a temperature of 120 F. Soft wood will absorb from eight to ten pounds per cubic foot, hard wood from six to eight pounds. Steeping in naphthaline is also attended with good results, especially in the case of green timber. A mixture of salt and chloride of magnesium for dry wood will preserve it, and also render it incombustible. This last is probably the most practicable for our correspondent's purpose.

He also wants to know how to clean copper plates.

When copper plates are stained with verdigris, which prevents their amalgamating with and saving the gold, the plates can be cleaned in the following manner: Thoroughly scrub the plates with fine sand and water, using a coarse gunny-sack or scrub-brush. Wash off the sand and then scrub thoroughly with a solution consisting of one part oil vitriol and four parts of water. The acid disintegrates the verdigris, dissolving the oxide of copper, and leaves the plate clean, when it will readily amalgamate with mercury without the use of cyanide solution, except the acid solution should have been made stronger than herein prescribed, in which instances the plate should be washed off with water, and then dressed with a solution of cyanide as usual.

A Grass Valley, Cal., man wishes "some way to tell approximately, off hand, how much proportionate sulphurets there are in quartz."

A practical formula for estimating the percentage of sulphurets in quartz is as follows: Take 10,000 grains or 20.8 ounces of crushed ore, which will pass through a 40-mesh wire screen. Wash the ore very carefully in batea or pan and rewash as long as sulphurets appear. Dry and weigh. Each grain of sulphurets will equal one one-hundredth of one per cent. If the sulphurets weigh 175 grains, the quartz contains one and three-fourths per cent of sulphurets; or, if twenty grains, one-fifth of one per cent. If the sulphurets are worth $100 per ton, the value of sulphurets in each ton of ore is $1.75, or one-fifth of one per cent—20 cents per ton. To test tailings, dry and weigh 10,000. Wash as above. Dry and weigh the sulphurets. Each grain will represent one one-hundredth of one per cent and a loss of one per cent per ton if the sulphurets are worth $100 per ton. Thus, if the 10,000 grains of tailings yield three and one-half grains of sulphurets, the loss is 3½ cents per ton in sulphurets. If the sulphurets are worth $60 per ton, multiply sixty by three and one-half, and 2.1 cents is the value of the sulphurets in one ton of tailings. If they are worth $375 per ton, multiply as above, and the value in each ton of tailings is 13.12 cents per ton in sulphurets.

From Rossland, B. C., a subscriber asks:

1. What is the best pulverizing machine to grind ore to a fineness of 80 mesh, and what is the capacity?
2. What is the amount of water required per ton of ore for Frue vanners and also revolving slime tables?
3. What is the cost and capacity of the latter?

The first is not susceptible of positive statement in this column. The answer to the second and third can be secured by addressing Jas. S. Brownell, 132 Market St., San Francisco.

From Middletown, Idaho, a subscriber says:

I want a simple, practical test for gold in refractory rock by which approximately correct estimates of the amount of gold to amount of rock can be made. I want an acid test. Is there a fluoric acid test? Is there a cyanide test?

Some of our many thousand readers can doubtless furnish what is asked.

A Fresno, Cal., man asks if there is such a thing as a Bureau of Mines, or something of that nature, in this State. He says he is a prospector and wants to be assisted in the determination of unfamiliar minerals. If he will send his specimens to E. M. Preston, State Mining Bureau, 24 Fourth St., San Francisco, they will receive prompt and competent attention.

A Bishop, Inyo county, Cal., prospector asks: "Is the Yosemite reservation open for prospecting and mining?" It is.

From Eureka, Wash., is asked: "Will putting up buildings and machinery for work on a claim count for assessment work?" Undoubtedly, if accompanied by such other work as would necessarily go with the erection of such a plant, and if done in the required time.

A Shasta Co., Cal., mining superintendent asks if it is so that he must pay his employes every month. An act approved March 29, '97, says that "every corporation doing business in California shall pay at

least once a month each and every employe employed by such corporation in transacting or carrying on its business, or in the performance of labor for it, the wages earned by such employe during the preceding month." This is a sweeping law. It will be noticed that it includes "every corporation," regardless of what business the corporation may be engaged in. Of course, mining corporations come under this law. A test case was made in Mendocino county immediately after the passage and approval of the law, and on July 2, '97, the Mendocino county Superior Court sustained its constitutionality.

A Bannack, Mont., subscriber wants to know what kind of hydraulic mining it is that is known as "booming" with a "shooter."

A Trinity county, Cal., correspondent thus described it: "A peculiar feature used in this end of the State to assist the placer and hydraulic miner is what is known as a 'shooter.' It consists of an automatic reservoir of various sizes and shapes, that collects all the water not run through the 'giants' or 'monitors' for, say, fifteen minutes, (as in the case of this mine), and then a valve automatically opens of sufficient size to allow all the water thus collected to escape in five minutes, thus obtaining the use of over 20,000 inches of water for five minutes that 2000 inches has furnished by cacheing it for fifteen minutes. I saw the above force of water carrying boulders weighing over 500 pounds through one mile of flume in five minutes. Nearly every hydraulic mine in these northern counties is equipped with one of these 'shooters.' On the Boss & McClary placer mine, adjoining Trinity Center, the 'shooter' box is 20x40 feet square and 6 feet, with an automatic opening of 18 inches by 4 feet. They have a bedrock flume 6 feet wide by 3 feet deep, nearly half a mile long, lined with 9-inch blocks."

On this subject a prominent California mining engineer has written that it was in northern California that the style of hydraulic mining known as "booming" was first introduced, and has since been most largely in use. It is practiced only along the gulches. These affording but little water, it became necessary that the limited supply be reservoired and properly distributed in order to make it effective in this method of gravel washing. The object is attained by retaining the water in dams and then releasing it suddenly, with a rush or boom. Near the bottom of the dam built for this purpose is left an aperture so large that when opened the water escapes rapidly. Placed on the top of the structure is a small race, through which the water flows when the dam is full, and is discharged into a large wooden box suspended from the end of the sweep, turning on a pivot, and the upper end of which extends to and over the top of the dam. Attached to this end of the sweep is a strip of heavy canvas which, dropping in a fold over the aperture below, keeps it tightly closed when the dam is full. When this stage has been reached the water flowing through the race into the wooden box mentioned soon fills it, causing this end of the sweep to sink and the other to rise, carrying with it the strip of canvas and uncovering the large aperture below, allowing the water to rush out. Meantime, the wooden box, having emptied itself through numerous small holes made for the purpose, this end of the sweep, relieved of its weight, rises, and the other end drops. The canvas falls over the outletting aperture, closing it as before. Then the dam fills again to the brim, and the operation as above is repeated. This plan for handling water is wholly automatic. It takes care of itself and goes on day and night, without any attention on the part of the miner, doing its work as long as the water lasts. This is one of those ingenious contrivances for which the California miners have ever been noted. Since its introduction in the northwestern part of the State, it has been brought into use in many other places, some of which have presumed to claim its paternity, a distinction that unquestionably belongs to this State, where this device was originally known as the "self-shooter." While to us belongs the credit of this invention, to others belongs the credit of having substituted for the above name the more appropriate one by which it is now known.

An inquiry from Ellensburg, Wash., is regarding how and what the U. S. Mint pays for gold.

The Government pays for gold at the rate of $20.67 per ounce fine, or $18.60 per ounce standard (.9 fine). There is no charge for coining gold. When the bullion deposited is not suitable for coinage, and requires parting and refining, charges are made for these operations equal to the expense incurred in eliminating the base metals and parting the gold from the silver when the two metals are combined. There is also a charge of 2 cents per ounce for copper required for alloy. Upon gold bullion of standard fineness—that is, containing .9 gold and .1 copper—no charge whatever is imposed. The depositor of gold bullion is allowed 100 cents for every 23.22 grains Troy of pure gold his deposit may contain.

A San Francisco reader sends in the following:

Take a car with a truck under each end and the car running on a level. The brakes are applied to one truck only. In one case that truck is on the front end of the car; in the other case the car is going in the opposite direction, so that the truck with the brakes applied is on the rear end of the car. In which case, if in either, would the brakes be most effective in stopping the car? In other words: everything else being equal, would the brakes on the rear end of the car be more effective than on the front end?

An intelligent reply to this question will gladly be published.

A Leland, Oregon, inquirer asks: "Does the O. & C. R. R. Co. offer all their mineral land for sale at $2 50 per acre? Do they reserve all minerals except coal and iron in their deeds? It is understood that they do; but a letter addressed to F. Kohler, Portland, Oregon, asking for a blank form of deed, will give the required up-to-date information.

A Tuolumne county, Cal., subscriber says he has a mill to be erected on his mill site, but other people have located it, and asks can they hold it. That depends. He apparently does not give the entire facts. If it is "his" and he can prove that, they certainly cannot.

Another man from the same section writes: "I locate a piece of ground and another party builds a dam and ditch on the property to convey water on to his ground. Can the work so done be used by me as assessment work in securing patent?" No.

A Kingman, Arizona, reader wants to know how to "brighten up" his amalgamating plates. Silver-plated amalgamating plates, to give good results, must be clean. Cleaning these plates with a weak solution of cyanide of potassium or a strong solution of salt and water, using a brush with each, is recommended. The introduction into the battery of a saturated solution of wood ashes neutralizes grease or oil. Cyanide of potassium in dilute solution is used to promote amalgamation, but the practice of using the cyanide is less common than formerly. One or two pounds will be sufficient to clean the plates of a 40-stamp mill for a year. Some use a solution of vinegar and salt for cleaning plates. Very dilute nitric acid is also used, the plates being at once rubbed with quicksilver after being washed with clear water. The quicksilver itself is carefully washed and strained through a canvas bag to remove as many impurities as possible and again strained. On a small scale, it can be strained by hand through a chamois bag. When it becomes dirty or mixed with foreign substances, it must be retorted at a low temperature to thoroughly clean it.

An Anaheim, Cal., reader wants mining maps of the different counties of the State, showing their mineral resources, etc. It is understood that such maps are in process of preparation at the State Mining Bureau in San Francisco.

A Randsburg, Cal., man wants to know, "if a miner locates a mine under the mining law of May 26, 1897, and does not do the required $50 worth of assessment work in sixty days, does he forfeit his claim, and is it then open for relocation?"

This is the most important legal question of the whole lot received, and one that everybody hesitates to answer authoritatively. A lawyer who is looked upon as authority in all these matters, to whom the question was referred, gives the following reply:

The profession are divided in their opinion on this question. One view is that the State law requiring $50 worth of work within sixty days is in conflict with the Federal law which provides that $100 worth of work shall be done within a year from June 1 next succeeding the date of location. The other view is that the $50 State requirement is wholly disconnected from the annual assessment work fixed by the act of Congress. It is one of the acts of location. The provision is of the same character as is found in most of the mining States and Territories requiring the sinking of a discovery shaft within a specified time. In California the character of the preliminary work is not defined, but its value is fixed, leaving the locator his choice as to manner of development. The validity of the "discovery shaft" laws has never been seriously questioned. They have been in force for many years in several of the States. If these laws are valid, there is no reason why the California law should not be upheld, as it belongs to the same category. If valid, a failure to comply with it would render the claim subject to relocation.

A Murphys, Cal., subscriber asks if he posts a notice within three days after bonding his mine would he be held responsible for any debts created; or whether if after posting his notice he would only be responsible for the debts created before he posted his notice.

Upon bonding or leasing a mine the owner must immediately give sufficient public notice under the Mechanics' Lien law that he will not be responsible for debts contracted by the bonder or lessee. We cannot undertake to be more than general in this matter; and where any complications arise on this or kindred subjects our advice would be to secure the services of a competent lawyer.

A Coulterville, Cal., man wants to know how deep the Idaho-Maryland mine at Grass Valley is. From a diagram furnished by the Supt. of the mine it is 3100 feet on the incline; about 2200 feet vertically. The Kennedy mine, Amador county, Cal.—2400 feet—is the deepest mine in the State.

A Denver assayer wants a complete account of refining and coining in the U. S. Mint. An elaborate serial entitled "From Mine to Mint," giving a full description of much that the Denver man asks for was published in Nos. 20, 21, 22, 23, 24, 25 and 26, Vol. LXXIV. The mint method used in the San Francisco mint is based on a process patented by Pike. It is interesting in connection therewith that Pike sold his patent over forty years ago to the U. S. Government, the price being a steady job in the mint at $7 per day—a position that he has faithfully filled for over two score years. Data on mint methods of the local mint are now being procured and will shortly be published herein.

The above by no means embraces the entire list, but serves to illustrate a phase of the conducting of a journal that is not often given publicity.

A KASLO, B. C., PAPER has some lengthy arguments against this country's duty on lead and lead ore, and in favor of the Canadian government raising the tariff on lead to a figure at least equal to that of this country, in hopes of creating a smelting industry in British Columbia and "preserving the Canadian market for Canadian lead." The subject is one which will be thoroughly discussed in Canada. It may be said that before the present United States duty on lead ore—which is so strongly objected to—was imposed British Columbia was netting $1.75 per hundred pounds for its lead imported into this country, and is now netting $2.10.

CALIFORNIA CONGRESSMEN have argued favorably before the House Committee on Mines for the creation of a new Cabinet position to be filled by a Secretary of Mines and Mining, and a favorable report is expected. It is thought in some quarters that it would be advisable to abandon the project and try to secure the creation of a Commissioner of Mines. This subject will be discussed at a meeting of the Executive Committee of the California State Miners' Association in San Francisco on the 28th inst.

THE International Mining Convention which organized at Denver last June will meet in Salt Lake City, Utah, July 6th, '98. A good start was made at Denver, and the Salt Lake meeting promises to be of value to the miners in this west half of America.

The Kern River Electrical Enterprise.

In the Los Angeles, California, *Times* of January 15th, '98, appeared some statements regarding the electric power enterprise of the Kern River Company, which proposes to bring power to Los Angeles from the Kern river, a distance of 108 miles, which will be the longest power transmission line in the United States, with the exception of the scheme noted in last week's issue of this paper, which proposes to bring power from the high Sierras, a distance of 120 miles, to San Francisco.

A Mariposa correspondent of the MINING AND SCIENTIFIC PRESS made some criticism on the plans of the company as decribed from a technical standpoint, which appeared in the MINING AND SCIENTIFIC PRESS of February 12th. In the Los Angeles *Times* of February 26th appeared an answer to our Mariposa correspondent, which assumed that the original statement, as it appeared, was not subject to the criticism which he made and which sharply opposed his views. In further substantiation of his original criticism, our Mariposa correspondent writes as follows:

"I am not specially interested in the matter, but it is illustrating the tendency of the lay press to put forth very unreliable statements. The rejoinder in the Los Angeles paper principally objects to my use of the word 'turbine' in its colloquial sense. With all due deference to the Century dictionary which it quotes, I must maintain that custom, trade practice and technical literature often constitute a higher authority than the dictionary for limited and special application of their terms, and while in the eye of Professor Whitney any reaction wheel was a turbine, the term is not to-day in common use as applied to wheels of the Pelton, Knight and Girard types. The paper tries to make it appear that I said turbines were never used under certain heads. What I said was that 'modern practice rarely sets turbines under heads exceeding 60 to 75 feet,' and the statement is not disproved by citing the only notable exception to the rule, the Niagara turbines. To help my critic out I will add that I recall the installation in Washington some six or eight years ago of a small turbine under a head of some 160 feet, to furnish lights for the Stampede tunnel. I mention this to show that I used the word 'rarely' advisedly. Probably some of the recent electrical installations on this coast present as fair an exposition of best hydraulic practice as can be had. For instance:

Plant—	*Feet Head.*	*Type.*
Portland, Or.	40	Turbine.
Folsom, Cal.	55	Turbine.
Bodie, Cal.	350	Pelton.
Bakersfield, Cal.	202	Girard.
Fresno, Cal.	1410	Pelton.
Redlands, Cal	530	Pelton.
Pomona, Cal.	300	Pelton.
Redlands (No. Cal. P. Co.).	725	Pelton.
Murphy's, Cal.	500	Pelton.
Dalmatia, Cal.	110	Pelton.
Gover, Cal.	340	Pelton.
South Yuba, Cal.	206	Pelton.
Blue Lakes, Cal.	1043	Doble.
Newcastle, Cal.	460	Pelton.
Salt Lake, Utah.	380	Pelton.
Aspen, Colo.	330	Pelton.
Utah Power Co., Utah.	435	Pelton.
Butte, Mont.	56	Turbine.
Helena, Mont	29	Turbine.
And the later compressed air plants—		
Massachusetts Hill, Cal.	775	Pelton. (19½ ft. diam.)
Gwin, Cal.	420	Pelton. (19 ft. diam.)

"It will be noticed that in the above list are but four plants which use turbines, and none of these under a head equal to the limit I placed.

"I am pleased to know that the company is not hoping to accomplish much in the way of equalizing the flow of the Kern by storing in its 42,000-acre-foot reservoir, but it was distinctly so stated in the article to which I took exception and which the Los Angeles paper says was 'detailed and authentic.' Without discussing the matter of 'scientific literature,' my note was written with all the thus far observed measurements of the Kern river at hand and the facts are as I stated. The article which I criticised read: 'This water will be caught during the time of winter floods and will not only abate their violence but will afford sufficient water to increase the summer flow of the Kern river by nearly 50 per cent continuously during the period of low water, thus increasing the capacity of the company's power plant by that amount as well as conserving the water supply of the whole adjacent district.'

"There are no winter floods to abate anyway, as already pointed out, for the average flow of the river from September 1st to April 1st is below the mean annual flow, and the value of a 42 000-acre-foot reservoir to 'abate the violence' of Kern floods when they do come may be estimated from the fact that the flow of the river in May, June and July of 1884 is reported by Hall to have been 1,250,000 acre feet, sufficient for filling this reservoir every three days for three months. Similarly, to 'increase the summer flow by 50 per cent' would require 2000 acre feet per day on the basis of the average flow of May, June, July and August, as observed for six years. The reservoir would stand the strain 21 days instead of 120, and so on ad nauseam. That the engineering studies of the situation have been ample and able, I have no reason to doubt; it was a newspaper rehash of them that I criticised as typical of just such trash that goes the rounds."

This whole matter is given here to emphasize two points: first, that it is just such criticisms as this of our Mariposa correspondent that are of most value to contemplated enterprises of that nature—not written in a carping, censorious way, nor intended to be merely captious criticisms, but pointing out exactly and technically the requirements of the situation and the mistakes liable to be made by loosely constructed language or loosely constructed notions in the minds of the projectors; and second, that much of the so-called scientific miscellany and statement that appears in the daily press cannot stand the scrutiny of close, technical observation.

It is the belief of the MINING AND SCIENTIFIC PRESS that instead of taking umbrage at the merited strictures of our Mariposa correspondent, the authors of the article in the Los Angeles *Times* should be thankful for having their mistakes pointed out. It is vastly easier to remedy such mistakes when they reach no further than paper than when they assume the expensive form of misconstructed work based upon mistaken assumptions.

The Witwatersrand Banket, With Notes on Other Gold-Bearing Pudding Stones.*

NUMBER X.

By GEO. F. BECKER.

In the United States.—The marine Triassic conglomerates which lie to the eastward of the auriferous area of the southern Appalachians contain a little gold. This was barely mentioned by Mr. Jules Marcou in 1862. In 1894, without knowing of Marcou's statement, I came to the conclusion that these conglomerates must be gold-bearing, and determined to test the matter. I found that mining on a very small scale had been done three miles northwest of Moncure, Chatham county, North Carolina. The pit may measure 100 cubic yards and is said to have yielded a little gold. I took samples from the cement and found gold in them with the pan. The conglomerate contains pebbles as large as a man's head, consisting of quartz, granite, schists, and porphyrite.

Gold was discovered in the Black Hills of Dakota in 1876 and caused some excitement among miners. The gold occurs in a marine conglomerate at the base of the Potsdam (Upper Cambrian). According to Mr. Henry Newton, the pebbles are quartz, quartzite, and some of the harder schists of the unconformably underlying, metamorphic rocks. The gold dust is very fine and its "concentration was begun by the shore action of the Potsdam sea." Mr. W. R. Devereux says: "The horizontal character of the sediments, and the fact that their accompanying life forms belonged to salt water types, leads us at once to the conclusion that they were ocean sediments and not river beds, and that they were formed in very shallow water, where there was strong wave action." The same authority remarks that there are pebbles of hematite and that the cement is oxide of iron; the ore needs stamping; the gold is found in smooth, rounded, flattened grains, ordinarily coated with iron oxide; the deposit is richest at bedrock and is said to have milled as high as $50 per ton; one nugget of three pennyweights has been found. It seems to me highly probable that the hematite pebbles and the ferruginous matrix represent decomposed pyrite. It will be observed that the largest nugget reported is trifling in size compared with those common in river gravels. Mr. Waldemar Lindgren tells me that this conglomerate extends down into Wyoming, and is said by trustworthy local informants to be auriferous on both sides of the Black Hills of Wyoming. This conglomerate would appear to be the nearest analogue to the Witwatersrand gold field.

There is also an auriferous conglomerate at the Bald Mountain district, in the Big Horn range, in the extreme northern part of Wyoming. Bald mountain lies in about latitude 44° 50′, longitude 107° 50′. This pudding stone seems to have been worked since 1893. It is considered Silurian by Prof. W. C. Knight. Mr. G. H. Eldridge has visited the locality and colored it on his maps as Cambrian, but had no time to make a satisfactory examination of the occurrence. Other accounts represent it as agreeing in general character with Mr. Eldridge's basal Cambrian conglomerate. I have understood that there is an auriferous conglomerate in New Mexico, but have not succeeded in obtaining any information about it.

In California three pre-Tertiary auriferous conglomerates are known. Mr. Lindgren has described one which forms a member of the Jurassic Mariposa marine beds. It occurs in Placer county, on the ridge between the north and middle forks of the American river, at an elevation of 2100 feet, and is many yards in thickness. The pebbles are phthanite and limestone, with quartz in variable quantities. There is no black sand, but much pyrite in the rock, which is a shore deposit. Mr. Lindgren made numerous tests of this conglomerate as exposed in a small shaft, and invariably found one or more colors to the pan. The locality is especially interesting because the main era of gold vein formation in the Sierra is later than this conglomerate, while its existence proves that there was also an earlier era of deposition.

Close to Folsom there is a stratum of conglomerate at the base of the Chico (Cretaceous), which carries some gold and has been worked on a small scale. There is every reason to believe this a marine shore deposit, near, of course, to the mouth of some stream which brought down the auriferous material.

Mr. R. L. Dunn has described an auriferous conglomerate in Siskiyou county, California, which is at least ten miles in length, and, like that at Folsom, lies at the base of the Chico, of which it is a member, resting unconformably on the metamorphic rocks. It has an average thickness of 100 feet, and most of the pay is near the lower surface. The gold is both coarse and fine and is accompanied by hematite and pyrite. Mr. Dunn regards this conglomerate as river gravel, but Mr. J. S. Diller tells me that those portions which he has examined within the area mapped by Mr. Dunn have the physical and stratigraphical characteristics of marine deposits, and, furthermore, they contain marine fossils, which renders further argument needless. Nevertheless, at some point or points there may be submerged river gravels, such as Mr. Dunn supposes, though the evidence which he adduces is not convincing. Mr. Dunn states that a conglomerate in the same geological position as far south as Redding is also auriferous, and that at Ashland, in southern Oregon, a conglomerate has milled $5 per ton in free gold.

In British Columbia no pre-Tertiary auriferous conglomerates are yet known to exist, though Dr. George M. Dawson suspects their presence and has made tests, thus far with negative results.

The most westerly auriferous conglomerate discovered in America occurs along the headwaters of Forty-Mile creek, which is a tributary of the Yukon, in Alaska. The creek joins the river about latitude 64½°. The conglomerate in question was first recognized as auriferous last July by Mr. Josiah Edward Spurr, of the United States Geological Survey, and no account of it has yet been published.* It forms the basal number of a heavy series of rocks believed to be of Cretaceous age. The basal conglomerate is in the neighborhood of 100 feet in thickness; it is of marine origin and rests unconformably on metamorphic rocks. It has never yet been worked for gold, and the evidence of its auriferous character rests upon the sudden enrichment of the streams which cut through it.

In Australia.—The earliest discovery of auriferous conglomerate in Queensland was, I believe, at the Peak Downs district. In 1870 Mr. Richard Daintree wrote: "The miners use the Carboniferous sandstone, the Glossopteris bed at the bottom, and take the cement several inches from its junction with the Glossopteris bed for their wash dirt."

The cement is conformable with this bed. The gold is waterworn. Similar occurrences are known in New South Wales. The Rev. W. B. Clarke, in 1875, discovered gold in the Carboniferous conglomerate of Tallawang, Phillip county, New South Wales, and at other localities. Mr. C. S. Wilkinson states that these conglomerates are associated with sandstone and shale containing Glossopteris.

Mr. Harrie Wood writes: "The conglomerate [of Tallawang] yields from one to fifteen pennyweights of gold per ton, while nuggets weighing five ounces have been obtained from it. The gold is generally in the form of flat scaly pieces, and waterworn. At Cooyal, and other parts of the Mudgee district, waterworn gold occurs in coal measures. Gold has been discovered in the marine conglomerates and shale beds, which are believed to be of Cretaceous age, and which rest upon the flanks of the Silurian, Devonian, and granite formations in the Mount Brown or Albert gold fields."

Mr. Wilkinson has also recorded the existence of a gold-bearing conglomerate at Gulgong, Phillip county.

Mr. Clarke found gold in the coal measures in the southern part of the colony near Shelleys Flat, Shoalhaven, prior to 1860, and as far back as 1855 a quartz pebble from the Carboniferous showing gold was detected by Sir Thomas Mitchell. The Australian Carboniferous contains an abundance of marine fossil Mollusca.

*Eighteenth Annual Report Mineral Resources of the United States.

Since the above was written Mr. Spurr's elaborate report has appeared. From advance sheets the MINING AND SCIENTIFIC PRESS was enabled to publish the salient points. It appeared in Nos. 4, 5, 6, 7, 8 and 9 of the present volume.

(*To be Continued.*)

ANTIMONY is found in this State and Utah in the form of a sulphide (stibnite). It is used as an alloy with other metals and, to a large extent, with lead in the manufacture of type metal, to which it gives hardness. A valuable feature is that it possesses the peculiarity, when used as an alloy, of expanding at the moment of solidification, thus giving to the types a clean, sharp impression. It is also used in making Britannia metal, Babbitt metal and pewter, and as an alloy with aluminum, to which it imparts hardness and elasticity. The medicinal preparation—tartar emetic—is a tartrate of antimony and potassium.

Preserving the Forests.

By W. E. WILSIE, Ventura, Cal.

When apparently there are no forests within 500 miles of us, it would seem folly to discuss a subject so foreign to our interests. But may it not have a redeeming feature? It may, upon investigation, prove to be a larger subject than at first thought it appears. The measly brush that covers our mountain slopes are our forests; the greasewood and the manzanita, the lilac and the sage brush, the scrubby oak and the towering pines.

This question of forest preservation conserves our water supply. It is a question that directly interests people in southern California. It is a question that every man, in whatever branch of industry he may be employed, should carefully study; every water company, every power company, every railroad company—in fact, everybody in southern California—should stop and ask themselves this question, for it is of vital importance to our interests here.

Nature's Reservoirs.—Whence comes this water with which we are supplied during our long dry seasons? Usually, the people get their water from the water company and it from the mountain streams. But where is its source of supply? Nature's reservoir. Our forests are the cover to this. Above and around our beautiful valleys are high mountains, whose slopes are covered with a thick forest growth which shades the surface and whose fallen leaves and twigs form a thick, soft blanket covering, which takes up the moisture as it falls and retards evaporation thereafter. Nature has given us this reservoir, furnished the water and expects us to keep it in repair. For years, while the country was settling up, this reservoir furnished such an abundant supply of water that the people failed to properly guard it, until now, when we need more and examine our reservoir, we find it has a leak. It doesn't hold water as it once did.

Why the Reservoir Fails.—This leak is the destruction of the forest growth, the lifting, as it were, of this blanket covering of leaves and mould from the surface of the mountain slopes, thus allowing the moisture as it falls to run off rapidly, washing great ravines, etc., as it comes tumbling down the mountain sides to join neighboring waters in the destruction of property, as it rushes madly on into the sea, when it should have been retained in this mountain reservoir to be drawn from as it was needed during our long dry seasons.

This destruction is caused by negligence, carelessness and recklessness on the part of the people. These mountains are ours, and it is for us to say whether this destruction shall go on or whether this forest growth shall be preserved.

We allow sheep to range over our mountain slopes, ranging from place to place, destroying young herbage and seedlings, and, by the trampling of their sharp hoofs, the surface of the ground is soon changed so no seed can germinate. Then comes the irresponsible herder and burns the mountain sides, that the sheep may have young shoots to browse upon the following season. Thus the forest is soon doomed to destruction. It is gross negligence on the part of the people to allow this. Not that the business is illegitimate as such, but, carried on as it is, it is incompatible with all the other interests which the foremost may subserve; just as the proverbial incompatibility of the goat and the garden, so is the growing of wood and wool on the same ground.

Through indifference, we allow fires to burn all over our mountain sides with but a passing thought, and no care as to the consequences. Reckless campers and hunters burn many thousand acres of forest cover of our mountains annually. The great watersheds of southern California are fast becoming denuded of their forest cover, and, if it is not stopped, our water supply is in danger of becoming materially less.

Forest Reservations.—This leak must be stopped. The Government has seen this, and Congress has already passed an act providing for the setting apart of portions of the public domain in forest reservations, to the end that this forest cover may be preserved.

I quote from B. E. Fernow, chief of the division of forestry of the Department of Agriculture, who, in a pamphlet entitled "The Forest Reservation Policy," says: "The forest and brush cover of the mountains in the country west of one hundredth meridian occupies a small portion of the total area, probably not more than 35 per cent. The timber of useful kinds occupies hardly 15 per cent of the whole. The distribution and character of this growth is extremely variable, from the chapparal and stunted growth of southern California and the open pine and cedar and spruce of the lower Rocky mountains to the magnificent world-famed giants of the Sierras and the dense unmatched forest growth of the Cascade and the Coast range in northern Oregon and Washington. Corresponding to the difference in distribution and development of forest growth, the climate varies, especially with reference to moisture conditions. The northwestern portion of the Pacific coast has an abundance of rainfall and high relative humidity; the southern portion and lower Rocky mountains are more or less arid. In either section a forest cover of the higher elevations and slopes is needful; in the one case to hold back the snow and rain water from inundating the agricultural lands below, in the other to preserve the scanty water supply by impeding evaporation."

The Government is ready and willing to help us in this matter. Let us have set aside as a forest reserve the mountain portions of southern California. It will be done for the asking. It looks like a big thing to ask for, but let us ask great things and expect great things. I have heard it said that if a person really would make up his mind to do a certain thing he could do it. If the people of southern California really made up their minds that they want the forest growth preserved on their higher mountain slopes, they can have it. All they have to do is to say that they want it, and they will get it, for the department already recognizes the necessity for it. There is only one man it would hurt and that is the sheep herder, and it would be far cheaper to give him a pension and let him retire to some quiet country town, there to spend the balance of his days in peace and plenty, than to give him free access to our mountain reservoir, and there, through recklessness, destroy what Nature intended for the people.

Conness on Cams.

A good many old Californians will remember John Conness, who got 31,000 votes here for Governor in 1861. He is now living in Boston, Mass., and, of an early change that was made in the mechanism of the cams in a stamp mill, says:

"Once in my California life I invested in one of the rich mines on Amador creek, where Hayward obtained his first fortune. He was a placer miner in El Dorado, near where I lived. At that time there was one stamp mill in place and at work on Amador creek. It was of an English pattern. The shafts of the stamp were square beams of wood, not less than eight or ten inches square, and the cams ran into mortises in the shafts, by which the stamps were lifted. I was one of two appointed by our company to go to San Francisco and have a mill made to work our lode. Observing the Amador mill work, and noting its clumsiness, and afterward, on the way down the Sacramento river on the steamer Confidence, observing what are called the lifting rods of the engine rise and fall through metallic boxes smoothly and wholly without friction, I adopted the plan of having the shafts of the pestles made of iron, turned smoothly and run in metallic boxes, like those on the engine of the steamer Confidence. A shoulder was keyed on the shaft or lifting rod, so that the cam could lift readily; but as the shaft or rod was round, and so that the lift might be done by a hold on both sides of the rod against the keyed shoulder, we had the cam made with two arms instead of one, just like two of your fingers. The mill was erected and it worked beautifully.

"Now, one of the difficulties of the English-pattern mill was that the stamp rose and fell perfectly straight. It worked between two heavy beams of wood, which were horizontally placed to keep the rise and fall of the pestle within its narrow bounds. The result of this was that the ore or rock would get into the angles of the mortar and the faces of all the pestles would become worn unevenly, and, finally, either side of a pestle would look like a wedge and fall with a thud, not doing its work of pulverizing the ore. The pestles were constantly being removed to be cast over and as often wearing unevenly on their faces.

"Our mill being round and swinging a little to the right and left, and, as you will see, having no lateral beams keeping square pestle rods rising and falling perpendicularly, was a great improvement on the face-wearing plan, which was seen at once. But one day one of the cams lost one of its forks, or fingers, by breaking off at the junction, and at once the stamp, while it raised with perfect ease, had an increased swing, rotating from one side to the other; and its face, having an equality of wear, did its work beautifully. There was no crowding of the ore from one side of the mortar to the other; it was a mechanical revelation. We had all the cams made with one finger or wing, and that did more for quartz mining than was ever accomplished in any other way.

"Our company employed one of its members—a lawyer—to superintend and do the work. There was neither let nor hindrance to his management, but in a year or two we closed up the mine, assessed ourselves, paid the debts and quit. A. H. Rose took the mine afterward and made a great fortune out of it. I had much experience in mining and put a good deal of money in it, and what I learned was that the best mine in the world could be frittered away for want of good judgment in its management."

C. H. MCCORMICK of Victor, Colo., has invented a new danger signal for use in connection with vertical shafts to automatically indicate at which level the cage is. Near the shaft is a lamp stand located in the drift. This stand has a vertical column rotatable a quarter turn, effected by a rack and pinion gear, the rack arranged to move in guides, the stem of the rack extending and connecting with a bow spring secured near the guideway of the cage. The bow of the spring projects within the path of the cage. The lamp is placed on the rotatable stand, and has white lights oppositely placed and colored lights oppositely placed on the other side. Normally, the colored lights are displayed, showing the absence of the cage from that level. When the cage arrives at any level it impinges against the bow spring, causing the latter to straighten and thrust the rack bar to turn the white light. As long as the cage stops there the white light is displayed, but when the cage leaves the level the spring will resume its bow form, drawing the rack bar and causing the shaft to give a quarter turn to display the colored light.

Gold Deposits, Geology and Geography of Alaska.

NUMBER II.

It is in the Forty-Mile district and the adjoining mining district on tributaries of Sixty-Mile creek that the relations of the different gold-bearing series are best seen. Here there is an east-west axis or backbone running parallel to the upper part of Forty-Mile creek and along the divide between it and Sixty-Mile creek, with quartzite-schists of the Birch Creek series resting immediately on it both to the north and to the south. Above these on either side are the marbles and alternating schists of the Forty-Mile series. Forty-Mile creek below the fork runs for a considerable part of its course along the junction between these two series, on the northern flank of the anticline. Dikes of various eruptive rocks, including intrusive granite, are very abundant, especially on the South Fork. On the upper part of this fork are green tuffs and slates of the Rampart series, overlain unconformably by granites, sandstones, and coaly shales of the Mission Creek series. Both the South Fork and Sixty-Mile creek are supposed to head in a backbone of granite around Sixty-Mile Butte, which is surrounded by quartzite-schists of the Birch Creek series. These regions lie partly in American, partly in Canadian territory.

Canadian Territory.—The Canadian area has not been studied by American geologists, except in wayside observation along such routes of travel as necessarily lay through it. The Canadian geologists, on the other hand, did not in their earlier and published observations recognize any subdivisions in the older rocks such as have been made by Spurr. Hence it is not possible to attempt even a proximate outline of the Canadian gold-bearing rock formations. General geological data and local discoveries of gold-bearing gravels indicate that the gold-bearing area is very large, and may be roughly defined as reaching from Dease river to the boundary, with a width of 200 to 300 miles or more. The recent enormously rich discoveries have, however, been confined to a more limited area around the Klondike and Stewart river districts, over which it has been possible to extend, with a reasonable degree of probability, the colors indicated on the map for adjoining American areas. Thus it is assumed that the east-west uplift of fundamental granite and overlying rocks extends eastward into the Klondike district, and that a second uplift in a southeasterly direction extends from upper Forty-Mile Creek toward the valley of Stewart river.

Spurr noted outcrops of the schistose quartzites of the Birch Creek series for a large part of the distance from the mouth of Forty-Mile creek up to the junction of the Pelly and the Lewes at Fort Selkirk; also granites at various points, in some cases schistose like the fundamental granite, in others fresh and massive like intrusive granite. There were also occasional belts of marble belonging to the Forty-Mile series, notably one five or six miles above the mouth of Sixty-Mile creek, not far from that of Stewart river. These observations afford a rough section across the belt of crystalline schists mentioned by the Canadian geologists as stretching eastward and southeastward along the upper Pelly and adjoining streams and across to the Frances river. Along the eastern edge of the crystalline belt they also recognized rocks of a general greenish color, made up largely of altered volcanic rocks, which would answer to the description of the Rampart series. Similar rocks were also noted at various points on the Lewes above its junction with the Pelly, notably in the Seminow hills near the Big Salmon river, which may represent the development of the Rampart series on the south flanks of the crystalline belt.

Fossil Placers.—Intermediate between detrital materials of the present surface and original deposits in rock-in-place are conglomerate or cement beds, derived from older rocks, but subsequently hardened into a rock mass. These deposits, where gold-bearing, are generally known as fossil placers. The cement beds of the Black Hills of Wyoming and the "banket" reefs of the Transvaal are prominent types of such deposits.

Similar formations have been noted in the Yukon district, but more study must be given them before one can judge whether they are likely to prove of

great economic importance. Basal conglomerates derived from the wearing down of the older rocks occur in the Mission Creek and also in the Kenai series. On Napoleon creek, in the Forty-Mile district, a coarse basal conglomerate referred to the former series consists of materials derived from the Birch Creek, Forty-Mile and Rampart series. It dips steeply up the valley, and gravels of the stream that cuts across it are barren above and rich in placer gold below it, showing that the gold is derived from this bed.

Steeply dipping conglomerates, thought to belong to the Kenai and containing abundant pebbles of rolled quartz and other rocks, occur at the richest portion of the Koyukuk valley, about 300 miles above its mouth, and the gold there obtained is supposed to be derived in great measure from them.

Recent Placers.—Recent placer deposits may be divided into beach gravels and stream gravels, and the latter may be formed as deposits either from ancient or from modern streams.

Beach Gravels.—Auriferous sands have long been known to exist along the California coast, and are found to be quite extensively developed along the coast of Alaska, as has already been briefly indicated. So far as known, such placers have not yet been worked at a profit to any considerable extent, on account of their want of permanence. A sudden storm may so shift the sand bars in which the gold is found as to render futile a great part of the labor already done in preparing to work them. Fossil placers are in most cases beach deposits, for deposits of any considerable areal extent must necessarily have been spread out by ocean waters.

Ancient Stream Gravels.—The most notable instances of ancient stream beds that have been profitably worked are the old river beds on the western slope of the Sierras in California, where they have been preserved from modern erosion by being covered by flows of hard lava rocks. Similar lava flows are not uncommon in the interior of Alaska. They have been noted on St. Michael island and at Anvik, near the mouth of the Yukon; on the Yukon near the mouth of the Koyukuk, where they form bluffs 700 feet high; at various points on the Porcupine river; on Chicken and Napoleon creeks, in the upper part of Forty-Mile district; near the junction of the Pelly with the Lewes river, and for ten miles below; in Miles canyon, between Lake Marsh and Lake Lebarge; and on the Pelly near the mouth of the Hoole river. One instance only has been noted—in the Stikine valley, between Telegraph creek and the Tahltan river—where basalt has filled an old river channel and covered auriferous gravels in its bottom. In this case the bars of the present river, whose bed is for the most part cut below that of the ancient stream, were notably richer along the stretches where these ancient gravels were exposed. In none of the other localities were any underlying gravels observed, nor is it likely that in the interior region, especially in the more northern part, any such gravels, even if they exist, will be exposed, since, owing to the peculiar climatic conditions existing there, the modern rivers have not cut the deep valleys seen where the climate is warmer and the river gradient steeper, as in California. The lava flows noted above are all supposed to be of pre-Glacial age, and are basaltic, thus differing from the recent volcanic rocks along the Alaska peninsula and the Aleutian islands, which are mostly andesitic.

Silts.—One of the most striking features of stream deposits in the Yukon district is the great accumulation of fine silts in the broader reaches of the valleys. The greatest of these is the Yukon Flats, an area nearly 100 by 200 miles in extent, through which the Yukon river meanders for about 250 miles, from Circle City to Fort Hamlin, and which stretches forty miles up the Porcupine, where it is estimated to be ninety miles wide in places. In this flat region the Yukon river spreads out to a width of many miles, filling numerous channels, with an archipelago of broad, low islands of silt between them. The main stream generally follows the right bank, which it is rapidly cutting down, and is thus moving its bed gradually to the northward. On the southwest the flat extends to Birch creek, which below Circle City also meanders in it. Its general level is hardly more than 30 or 40 feet above the river at low stages, but other portions are higher and evidently above the level of overflow in the present condition of the river. Similar flats, but of more moderate dimensions, occur along the Yukon between Fort Hamlin and Mynook creek, at the mouth of the Tanana and for some distance up the valley of the latter stream, for 35 miles above the mouth of the Koyukuk river, and at various points below this river down to the Yukon delta. These silts contain abundant driftwood, and sometimes standing trees buried in place; also shells of living species; and in silt deposits above the conglomerates of the Palisades, 35 miles below the mouth of the Tanana, parts of the skeletons of mammoths and other animals have been found mixed with driftwood. The silts are also found in the lake valleys and broader river valleys of the upper tributaries of the Yukon, even within the region of glaciation. Here they are above the still or boulder-clay, which is the characteristic base deposit in a glaciated country, and are hence assumed to have originated since the retreat of the continental glacier and to be made up largely of the fine rock material ground up by that glacier. The fineness of their material suggests that they must have been deposited in quiet water, either lakes or very sluggishly moving streams; the more rapidly carrying away, except on the Yukon delta. In such deposits the gold that is brought down would be in the finest state of division and so generally disseminated as not to be likely to from workable placers. The stream gravels in the upper Yukon are found to be more recent than these silts, and rest upon them.

(To be Continued.)

The Use of Oregon Pine in Mining Operations.

The first step in the evolution of improved methods in mining, says G. A. Buell in the Mining Resources of Calaveras County, was the rocker; then followed the sluice-box, the material for both being whipsawed at great expense from timber adjoining the claim. These being used on the surface of the ground and having no weight to sustain, excepting their own, generally lasted as long as the claim paid. After the surface diggings were exhausted, miners naturally turned to gold-bearing quartz veins as a field promising great returns for the amount invested. In the pursuance of this theory, the shafts were timbered and lagged with hewn and sawed timbers cut from trees in the immediate vicinity, these trees in the majority of cases being the *Pinus ponderosa*, commonly known as bull pine. The mines being located in the heart of the Sierra Nevada mountains, with no method of communication with the valley and coast country save by wagon, the thought very naturally never occurred to the operators to ascertain if there was any other timber more suitable for the purpose, having more strength, more life, and, in fact, more durability in every way.

In the majority of cases they found the vein growing richer as the mine became deeper, and as a consequence the timbering at the head of the shaft, supposedly put in place temporarily, was found too light or else decayed in from one to two years, necessitating retimbering at a great expense. For stoping and tunnels, round timbers were used and are in use at the present time, although their life is of short duration, and in loose, shaley or schistose rocks at any great depth they have to be very massive and set close together in order to carry their load. A round timber, even though a small one, is a slippery and awkward thing to handle, and when one is from 20 to 24 inches in diameter the difficulty of handling is correspondingly greater.

Quite a number of mining companies are still using these old-time methods from the probable reason that the value of the Douglas spruce or *Pseudotsuga Douglasii*, commonly known as Oregon pine, has never been presented to their notice in such a manner as to sufficiently impress them with the economy of using it for their permanent work.

The purpose of this article is to demonstrate the superior quality of Oregon pine over any other available timber on the Pacific coast or elsewhere for permanent use in mining operations.

ABSTRACT OF THE RESULTS OF TESTS UPON BULL PINE (*Pinus ponderosa*) AND UPON OREGON PINE (DOUGLAS SPRUCE OR *Pseudotsuga Douglasii*.—Made by the University of California.

	Expts.	Average Results. Lbs. to sq. in.
1—Modulus of Strength at Elastic Limit.		
a. Bull Pine, seasoned log and sawed timber	3	4,500
b. Bull Pine, green log	1	4,000
c. Oregon Pine	4	7,750
2—Modulus of Strength at Rupture.		
a. Bull Pine, seasoned log and sawed timber	3	5,460
b. Bull Pine, green log	1	4,580
c. Oregon Pine	4	10,130
3—Modulus of Elasticity.		
a. Bull Pine, seasoned log and sawed timber	3	1,194,200
b. Bull Pine, green log	1	836,300
c. Oregon Pine	4	2,449,200
4—Percentage of Moisture.		Per cent.
a. Bull Pine, seasoned log and sawed timber	3	23.28
b. Bull Pine, green log	1	69.60
c. Oregon Pine	4	25.03
5—Weight Per Cubic Foot.		Pounds.
a. Bull Pine, seasoned log and sawed timber	3	31.00
b. Bull Pine, green log	1	45.80
c. Oregon Pine	4	40.71
II—TENSION TESTS.		Lbs. to sq. in.
a. Bull Pine, seasoned log	8	5,332
b. Bull Pine, green log	6	9,083
c. Oregon Pine	5	17,049
III—CRUSHING ENDWISE TESTS.		
a. Bull Pine, seasoned log	11	3,335
b Bull Pine, green log	5	2,243
c. Oregon Pine	8	5,849
IV—CRUSHING ACROSS THE GRAIN TESTS.		
1—Crushing 3 Per Cent of the Height.		
a. Bull Pine, seasoned log	12	598
b. Bull Pine, green log	10	356
c. Oregon Pine	8	741
2—Crushing 15 Per Cent of the Height.		
a. Bull Pine, seasoned log	12	808
b. Bull Pine, green log	10	524
c. Oregon Pine	8	1,048
V—LONGITUDINAL SHEAR.		
a. Bull Pine, seasoned log	20	327
b. Bull Pine, green log	21	375
c. Oregon Pine	16	574

By carefully examining this table it will be seen that the Oregon pine will stand, in most cases, double the load of the bull pine, which in turn demonstrates that additional cost for the Oregon pine would be more than made up by the decreased size of timber required to stand a certain strain, and, as an illustration of this, prominent mining men are now using 14x14 sawed Oregon pine timbers where they formerly used round timbers of bull pine 22 and 24 inches in diameter.

Among the first to use Oregon pine for their operations was the Gwin Mining and Development Company of Calaveras county, who sunk a three-compartment shaft 1300 feet before they attempted to take out any ore for milling purposes. Others followed in rapid succession, and it is safe to say that the majority of the leading mining companies in Mariposa, Tuolumne, Calaveras and Amador counties use no other timber in their mining operations.

Up to two or three years ago there was a reasonable excuse and argument against the use of Oregon pine, on account of the great cost of freighting it from terminal railroad points in the valley to the mines. This obstacle has now been done away with, as lumber companies with vast holdings have established distributing points at the terminals of all mountain railroads and can on short notice supply any size timber up to a mortar block, at a very slight advance in price over the mountain or bull pine.

The idea of this article is to bring to the notice of mining men the economic advantages of the use of Oregon pine which will stand the closest scrutiny and the hardest tests, and one trial will convince the user thereof of its superior value over any other known timber for mining operations.

The grade of Oregon pine best suited for mining purposes is known to the trade as merchantable or No. 1 building lumber, and does not require the service of a lumber expert to determine whether or no a timber is of standard grade and suitable for a certain purpose.

Admitting the lasting quality of the material, the next question to answer is, What constitutes merchantable Oregon pine? Coarse grain or wide spaces showing between the annual rings is not proof positive that a timber is lacking in strength unless, as sometimes happens, the growth between the rings is of a spongy nature, lacking fiber and easily picked out. When Oregon pine timbers 8x6 and up have been exposed to the action of the weather for any considerable length of time they become what is termed "season-checked." This does not impair the strength when the checks are parallel with the grain; where the check cuts across the vein, it is in reality a feature produced when the tree was felled, and the timber would be no stronger than the weakest point, which would be that portion not touched by the fracture. Pitch seams affect the strength of a timber in the same manner as the "season checks," and where they are not very long and run parallel with the grain they do not in any way affect the strength. Tight knots are allowable in this grade, and small loose knots when they do not materially affect the strength of the timber. Large loose or rotten knots or fractures which materially impair the strength should condemn a timber at once, and it should not be used under any circumstances. It does not matter what size trees the lumber is cut from, or, in other words, whether the grain of the timber or plank is slash or vertical, as long as the grain shows the length of the piece. Cross grain, or grain that shows both ends running out of the piece oppositely, even at intervals of 6 inches, is not desirable and could not be used for any purpose excepting lagging.

Mining companies who are constantly extending their works should keep at least six months' supply of lumber on hand, and when same is to be exposed to the weather for any considerable period it is advisable to stick same, allowing a free circulation of air, and the ends should be painted, which will, to a great extent, prevent checking. Where timbers are constantly exposed to dripping water or clouds of steam, it is advisable to dip same either in coal tar or a composition of which asphaltum is the main ingredient. By so doing the pores are closed so that no moisture of any kind can enter the wood. This is only necessary in extreme cases, as under ordinary circumstances timber will last the lifetime of a mine. It is, however, advisable to heed the ancient proverb, "An ounce of prevention is worth a pound of cure," and a brick or stone furnace with an iron vat and derrick to be used for dipping purposes could be erected at a very small expense, and it would permanently insure material thus treated from decay, as Oregon pine has never been known to decay or dry rot from the interior of the timber.

The chemical treatment of structural timber has been described by Mr. John D. Isaacs of the Southern Pacific Company, and will be found in a pamphlet written by him and published by the State Mineralogist in the thirteenth report, 1896.

CONGRESS has acted favorably on a prepared amendment to the sundry civil bill extending for one year the time when the surveys for forest reservations may be had. This continues the law as at present, and suspends for another year the latest order of President Cleveland making several large reservations.

Concerning Certain Physical Theories.

NUMBER III.

The nebular hypothesis, now advanced to a theory, supposes that the matter of the solar system was originally an intensely heated gas, extending as far as the orbit of the outermost planet, Neptune, and this gas cooled and contracted, thereby increasing in rotary velocity and throwing off successive rings, which condensed into the planets. The proximity of the orbital planes of the planets, and their spacing, point to some common origin, but the idea of a heated original gas has insuperable difficulties, of which the chief is the enormous and unnecessary waste of heat energy. This seems certainly sufficient to have kept a million solar systems comfortably warm during eternity. It is contrary to reason and to nature, as we know, to create all this heat simply to throw it away again *unused*. It served no useful purpose at all. It was imagined simply in order to get matter out to the verge of the solar system, and thrown away in order to get that matter, or most of it, back again. This matter would, if cold, become heated as it fell to a center, but, by the theory, it already had all the heat it could reasonably, or possibly, hold. To heat matter and then cool it, then let it fall together and reheat itself and finally cool it again, to get a habitable earth, is most certainly clumsy. This double heating and double cooling is especially to be noted. The pencil of the boldest may well hesitate to compute the energy thus lightly created and tossed aside.

If we accept this theory, several questions present themselves. Gases diffuse in all directions. To throw off a ring rotational velocity must be great enough to overcome attraction of central mass, and the same condition would exist inside the ring. Hence these gases, thus freed from constraint, would spread themselves, instead of condensing. Hence no tendency to condense into a globe is apparent. It is held that rings must have thick spots in order to form planets. Rings of solid matter might have such denser parts, but the nature of gases is to interdiffuse and equalize. The planets are not in the same planet as they ought to be if formed from a homogeneous gaseous body. A solid central mass seems to be indicated because such, either contracting or growing from outside addition, might well alter its axis. To throw off rings a rotating mass must be very oblate and must so continue till slowed by tides or other force. If the sun were ever oblate enough to throw off rings or planets, it ought to be still quite as oblate; and in the practical absence of tides, ought to rotate about twenty-five times as fast as it really does. On the tidal evolution theory, it is claimed to have been mathematically demonstrated that the moon must have been thrown off from the earth at about the time the latter was rotating in two to three hours, the rupture itself being caused, it is thought, by vibrations set up by solar tides, the possibility whereof is very doubtful. Since that rupture the earth and moon have slowed the axial rotation of each other by tides, and slowly separated. The same reasoning would apply to all planets having liquid. Hence it is not apparent how the second and subsequent moons of Jupiter or Saturn could have been thrown off, as solar tides would begin to slow rotation the instant any liquid matter formed. Neither is it clear how the solar force could cause a rupture, yet at the same time, or previously, slow the rotation and prevent a rupture. If two hours be the rupturing period, the rupture could not have occurred later, if rotation were growing slower. The prior rotation could not have been faster, on pain of rupture, nor equal nor slower if any liquid were on the globe, for the speed would have decreased, not increased. Thus either a gaseous or solid state required. A gas must become liquid before it can solidify. Hence it is difficult to see how the supposed rupture could occur. The idea that the moon was thrown bodily from one spot of earth is not tenable. The other side of earth would do the same unless explosion or other force be called in; but if solid particles were thrown off all around the equator, these would condense into a mass on account of the resistance of earth's atmosphere. If satellites were thrown off by any of the alleged processes, how did it happen that such giants as Jupiter and Saturn have moons so small, with two exceptions, smaller than our moon? Either a ring theory or a rupture theory would seem to involve satellites somewhat in proportion to their primaries. If our moon were thrown off from the earth when rotating in two hours, it would have a velocity of 12,500 miles per hour; if in one and one-half hours, say 18,000 miles. The present speed is only 2273 miles per hour. What became of the lost speed?

The formation of a thin crust on the surface of a cooling molten globe does not seem possible. Such crust would sink, though only to a point where pressure would render the liquid equally dense, there to melt. This process would in time make a thick crust. But that crust would be heaved and tossed by daily tides in the molten matter below. Volcanic lava is thought to come from the earth's melted interior. The above shows that the crust must be far too thick for any such thing; and the thickness of stratified rocks indicates the same.

Paleozoic rock of twenty miles thickness, other strata of five and ten miles, are supposed to be the debris of washed-down continents, deposited at sea bottom, then raised and washed down again. If half the original deposit was washed away subsequently and twenty miles was left, it must have been forty miles thick. If the ocean occupied half the surface of the earth, the land surface must have averaged eighty miles elevation. There seems to be a hiatus in the usual explanation.

A rotating mass of gas about to throw off a ring would be very oblate, with thin edge. If cooling, that cool edge would cool faster than interior, and hence its rotation increase faster than interior, and go ahead of it, instead of the reverse. If a ring were thrown off it would expose still more surface and hence cool still faster and return to the parent mass. If rotatory speed be desired merely from contraction, an atom or a world nearing the center would increase its angular velocity, but not its actual. The actual speed of Neptune is about 12,000 miles per hour; Uranus, 15,000; the earth, 66,000. Where does this increase come from? The rings of Saturn rotate in about the same time as Saturn, but are only about 100 miles thick, while 28,000 wide. Is such a form and speed consistent with any theory of a thrown-off gaseous ring? These rings were once pointed to as strongly confirming the nebular hypothesis; but they increase the difficulties. If the sun be as hot as some suppose—millions of degrees—it cannot have cooled to any appreciable extent (the cooling being from the outside of the great original mass, and certainly such heat would be all that the hottest theory ought to call for), and hence ought to be still rotating at about its original speed, say once in 165 years, as Neptune; but it turns in twenty-five days. Or if it be held that it has really cooled in proportion to its speed, and its present temperature be, as some estimate, 28,000,000 degrees, that multiplied by $\frac{365 \times 165}{25}$ would indicate considerable original warmth. It is very doubtful if any rotating gas spheroid could cool and contract and at the same time throw off rings. If it cooled at edge, that edge would rotate faster than interior, contrary to observed motion of sun and planets. There could be no way of cooling the center faster than the edge. If it cooled equally all through, it would not only be contrary to the action of all known cooling bodies, but it would require an intense internal circulation to convey heat outwardly; and it is not quite plain just how or why a portion of matter previously traveling from rim to center, could decide to become independent and go off by itself as a ring. Or if it did, what would hold it quiescent while the main mass could have time to shrink away from it.

If we totally reject, as we should, any theory looking to a heated gaseous origin to the solar system, what then? Certainly that such origin was from matter both cold and solid. We may conceive of such as a handful of dust thrown into space and endowed with two motions, onward and gyratory, or two colliding portions of matter, developing rotary motion, but in all cases two motions and matter more or less finely divided—cosmic dust. Such matter would inevitably coalesce into larger and larger masses. While small, such masses would be cold; as they grew larger the attraction of gravitation would increase the impact, and they would grow warmer and warmer, perhaps even to a molten condition on the surface. As the amount of such matter and condition of meeting may vary infinitely, so with results. For instance, if a cold globe overtook, or was overtaken by, other matter, the collision might be extremely gentle; if head to head collision, mild or great heat, according to mass. If periods of these two kinds of collisions alternate, or are succeeded by periods of no collision, there might ensue great variations of heat and cold, as seems to have been the case on earth. Possibly the great upheavals shown in geologic rocks may have resulted from collisions of large masses.

Nebulæ often show spiral, or disc, forms. If necessary to imagine the planets as formed from rings, it is immensely more reasonable to suppose those rings co-existing and formed of cold solid matter around a center rapidly rotating, as might result from a glancing collision. Those rings would form planets with similar cold centers, concerning which it should be noted that matter so building would form concentric arches, taking up the increasing pressure, and hence that the pressure at center of earth would be much less than usually supposed, and thus fully explain the density of earth. The pressure at center of earth, if built in any other way than above suggested, would be so great, 25,000 tons per square inch, that mean density of earth would be more than it is, and it has been unusual to endeavor to account for the difference by assuming heat as an expanding agent.

Moreover such coeval and coexisting rings would explain a fact which other theories fail to do. The outer four planets are very large and of small density. The inner four are small and of high density. The supposed rings might easily be of different material and different thickness. Being solid, they need not be homogeneous, as gas must be, and as matter originating from a common central mass must be. Also, such origin would allow, as gas theory does not, for the variation in the planes of revolution of the planets. Slight differences in density would fully explain such variation.

If, as maintained in a previous paper, heat does not radiate into space, and if, as the rocks and volcanoes of earth show, great heat has at one time prevailed at the surface of the earth, now cool, it is a proper question, what became of that heat? It went inwardly; was absorbed by the cold interior. This becomes more easy to understand if we remember that the earth is covered with a blanket, the air, to prevent outward radiation, and also that the interior is probably mostly iron, one of the best conductors of heat. About four-fifths of the meteorites met by the earth are of iron. The thickness of the sedimentary rocks thus would be partly due to the growth of the earth by outside additions—a fact that every meteor demonstrates. Some astronomers estimate that the earth captures daily about 3,000,000 particles of loose interplanetary matter. The earth, in its travels through space, may encounter at times clouds of such flying matter of more or less thickness.

In the above I present only the skeleton of a few arguments that seem to me to discredit a theoretical origin of the solar system other than from cold and solid matter.

W. S. PROSSER, Civil Engineer.

Auburn, Cal.

Recent Additions to the Collections of the California State Mining Bureau.

Coal of very fair quality, said to be used for blacksmithing; Rogue River, Curry county, Oregon; R. D. Hume. Five specimens of gold quartz from Coffee creek district, Trinity county, Cal.; W. R. Conant. Rich copper ore from Union creek, Trinity county, Cal.; Geo. Madeira. Sapphires, of a rich blue color, from near Utica, Fergus county, Montana; Jacob Hoover. Gold quartz from New Year mine, Soulsbyville, Tuolumne county, Cal.; Blodgett, Miller & Muller. Gold quartz, showing free gold, from Boulder mine, Trinity county, Cal.; G. S. Carr. Gold quartz, showing free gold, from Inauguration mine, Randsburg, Kern county, Cal.; L. L. French. Corellite (sulphide of copper), fine crystallized specimen, from Rio Grande county, Colo.; M. Bixby. Fine jade adzes and eight specimens of various minerals from New Caledonia; Dr. Jno. Rabe. Gold quartz, high grade, from Eagle mine, Eagleville, Churchill county, Nevada; Geo. A. Trimble. Thaumasite, a very rare mineral, from West Paterson, New Jersey; M. Bixby. Native copper from Old Dominion mine, Globe district, Pinal county, Arizona; Mrs. Tremble. Vanadate of copper from Mammoth copper mine, Glenn county, Cal.; E. W. L'Hame; first occurrence of this mineral noted in California. Gold quartz from Virginia Dale mine, San Bernardino county, Cal.; D. Balch. Turquoise from a new find between Goff's mining district, San Bernardino county, and Death Valley; Mrs. J. Young. Gold quartz from Chileno mine, Mariposa county, Cal.; J. W. Woodside. Gold quartz from the 220-foot level of the Alaska-Mexican mine, Douglas island, Alaska; R. A. Barclay. Gold on dolomite from a shaft 100 feet deep on section seven of the Mariposa grant, Mariposa county, Cal.; and ilmenite in dolomite from the same locality; John D. Ludwig. Gold quartz, ranging in value from $60 to $300 per ton, from Kellogg Creek mine, Plumas county, Cal.; F. Von Liecht. Gold quartz from Mayflower mine, Greenhorn district, Kern county, Cala.; J. M. Waugaman. Copper ore from Cholame district, Monterey county, Cal.; Frank M. Stone. Rich copper ore, cuprite and native copper, from South Fork of Salmon river, Trinity county, Cal.; R. D. Lawrence. Calcareous hornblendic rock, with limonite, hematite, pyrite and gold, from Mendocino county, Cal.; Dr. Geo. W. Stout. Silver ore with gold from Kwang Hsi province, southern China, value stated to be $100 per ton, of which $40 is gold; W. N. Fong. And sundry other specimens.

HENRY S. DURDEN, Curator.

A Colorado Compliment.

About 1100 newspapers and periodicals are weekly received in this office, and if one one-hundredth of all the kind things said therein about the MINING AND SCIENTIFIC PRESS was reproduced herein there wouldn't be room for anything else. The following is from the Silverton, Colo., *Standard*. Reproducing a few lines of illustrated comment, the *Standard* says:

The above is from the MINING AND SCIENTIFIC PRESS of San Francisco of Feb. 26. The MINING AND SCIENTIFIC PRESS is the greatest and most widely circulated of any mining paper extant, and the engraving and notice of the mineral resources of San Juan county was most assuredly a high compliment to both county and paper. As an advertisement it can not be overestimated. The MINING AND SCIENTIFIC PRESS reaches thousands of solid mining men and capitalists, who are invariably on the lookout for legitimate fields of investment. That paper does not cater to bogus mining schemes nor idle curiosity hunters, and is what it claims to be, a straight up-and-up mining and scientific journal. The good work done for our county through that journal cannot be overestimated. The MINING AND SCIENTIFIC PRESS merits a big subscription list in this town.

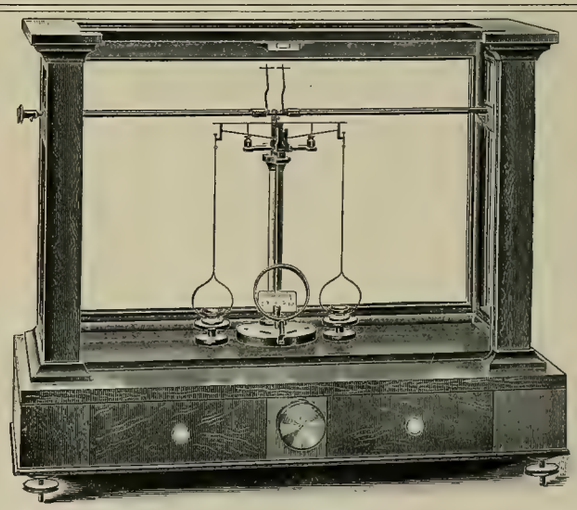
How Armor is Made.

The first process is that of casting the ingot. This is done by the molten metal being poured into a mold placed in the casting pit at one end of the melting house. The ingot is then first taken to the press house and placed in a reheating furnace to be got to the required heat for slabbing. The ingot is carried by means of a porter bar, having attached to it counterbalance weights. The largest ingots of seventy tons weight require eighteen to twenty-four hours for reheating. When hot enough, the ingot and porter bar are lifted by one of the 150-ton cranes and placed under the hydraulic press, which works at 8,000 tons. Here it is pressed or slabbed down to the required thickness. It is then taken to the mill and charged into another furnace, this time in a car furnace, and heated to the necessary heat and rolled to the proper thickness, the area rolled in most cases being about ten feet wide and twenty-six feet to twenty-eight feet long—sizes which of themselves carry some suggestion to the mind as to the heavy plant involved. The 8,000-ton hydraulic press used for reducing the immense ingots to a size suitable for the rolling mill is a magnificent tool, weighing in all 783 tons. It consists of two hydraulic cylinders forty inches in diameter having a stroke of ten feet; the body of each cylinder, of cast steel, is nine and three-fourths inches thick, and is supported by cast steel girders, carried in turn on four forged steel columns, which are secured at the bottom ends to the cast steel base plate, on which also the anvil rests. The gliders have a boss at each end, through which the columns pass, being screwed at the end and secured by coned bushes and screwed nuts. In connection with this press there are seven reheating furnaces with the necessary gas producers, and here it may be interesting to add that an ingot four feet three inches thick is squeezed in the press down to fourteen inches in thickness in about one hour, if for a finished plate, the plate being cogged in one heat. In the process the area for a finished plate is increased from nine feet by six feet long, to nine feet three inches by twenty-one feet long. For a slabbed plate for rolling the area is about eleven feet by twenty-seven and three-fourths inches thick; the slab is then passed to the rolling mill if the finished thickness is less than twelve inches, and the greatest area that can be rolled is twelve feet wide. Plates over twelve inches thick, however, pass direct to the planing shop, where they are machined accurately to finished thicknesses.

MANY amateur photographers fail owing to the ignoring of a few simple rules. An authority says that the beginner should buy a light stand, fill his magazine or slides with ordinary plates and practice time exposures on all sorts of still objects till he can turn out a good negative with a fair degree of certainty, and has mastered the elements of development. With the perfect plates and pure chemicals available nowadays, this should soon be accomplished. Snap-shooting may then be taken up. A stand should be used, as the vibrations of the human body are most mischievous in their effect on the plate. The plates should be only fairly rapid, as the very fast plates mean fog and disappointment to the beginner. If the operator would avoid pinholes, he must be jealously on his guard against dust. The camera should be frequently dusted out, and the inside smeared with thin vaseline, which collects and holds a large quantity of the dust caused by the powder of abraded glass chips and other causes. A golden rule is not to snap at random. Never expose a plate on a subject that will not, when developed and printed, be a credit to the album. For a resting place, if no better is at hand, use one knee, going down on the other to secure additional steadiness. Many photographers put the camera under the arm and press it to the side. The beginner will soon find which way suits him best. There is no hard and fast rule about exposures, but the following periods are recommended for general purposes: Wave studies, waterfalls and rapid rivers, one-fifth to one-tenth second; street studies, with no fast-moving horses or cycles within fifty yards, one-twentieth to one-thirtieth second; slow-sailing vessels or quick steamers, end on, about one-twentieth to one-thirtieth second; ordinary work and athletic sports, one-fiftieth to one-eightieth second; rapid finishes, one-one hundred and twentieth second, or over. Above all avoid the besetting sin of beginners, which is to set the shutter at too high a speed. Number every hand camera plate, entering full details of exposure, subject, light, etc., in a notebook against corresponding number.

PERCHOID is a new product, and a substitute for gutta percha, the supply of which has of late shown such disquieting signs of collapse. Perchoid, the invention of Dr. Napier Ford, is oil which has undergone a high degree of oxidation. Dr. Ford experimented for many years to produce a method whereby oil could be fully oxidized, and at last he succeeded. The result is perchoid. The oil is heated with litharge, stirred long and continuously, and then allowed to cool. Specially prepared tow is then dipped in it, and, placed in wire baskets, subjected to currents of air. The oil adhering to the filaments of the hemp becomes wholly oxidized. Under the microscope the hempen threads appear sheathed with a coating of amber. This is done through rollers and comes out as a leathery material, closely allied to, if not identical with, rubber. Its tenacity is increased by mixing it with sulphur. It can be rolled as thin as a piece of tissue paper and any fabric, and it makes leather impervious to moisture, though not to air. It is said to be eight times cheaper than rubber and more durable. One of its great fields will probably be the making of pneumatic tires. It is stated that a chemical manufacturer in London, whose hydrochloric acid tank used to be lined with gutta percha at a cost of $50, had a lining made of perchoid for $1 50, which serves just as well. Perchoid should be a godsend to the electrician, as it never becomes brittle, and never leaves the wire, two most valuable qualities in an insulator.

A COLD chisel for heavy chipping should be sharpened slightly oval or rounding. A tool sharpened thus will stand harder usage than when the cutting edge is concave, or even straight. The reason for this is based upon the strength of the arch. The engineer builds a dam across a stream in the shape of a curve for the same reason, and both the engineer and the beaver, in his native stream, obeys the same law in regard to this matter. Aside from the principle of the arch, there is less danger of breaking the corners off of a chisel when the edge is curved, for then the force of the blow is supported in a brace-like manner by the metal in the curved corners, whereas in the concave point the same bracing action, applied in the opposite direction, tends to split off the corners of the tool. The matter is so simple that every machinist should take advantage of it to add strength and durability to his tools. The same shape can be given to screwdrivers when they are to be used in chucks on work like that of putting screws into shoemakers' lasts. Thousands of screws are thus put in, and it is found that if the end of the screwdriver is rounded off the least possible amount it is much easier to make the tool bit engage the slot in the screw. When the bit is the least amount concave on the end, it is impossible to make the screwdriver take hold when running even at a low working speed. Make the end of the tool convex one-thirty-second of an inch, and the speed at which the tool can be put into a screw slot will be doubled.



ATTENTION is drawn by Moissan to the fact that calcium carbide is a powerful reducing agent, and hence, when in a fused condition at a high temperature, can furnish, by double decomposition, a number of new compounds. When acting on metallic oxides, the metal may be obtained in a free state, or, if it is capable of uniting with carbon, a carbide is formed. By this reaction Moissan has prepared crystallized carbides of aluminum, manganese, chromium, molybdenum, silicon, etc.

THE earliest miners and metal workers of whom we have record were the Aryan peoples of Euro-Asian origin, who, though of pastoral and arboreal habits, were familiar with the metals and worked with them—at least with the metals gold, silver and bronze. Chaldeans and Assyrians, as we now know from the cunei-form inscriptions which go back 3000 B. C., were undoubtedly expert in the use of metals, while the Egyptians had an intimate knowledge of the arts and sciences. In the brick and other inscriptions recently discovered, artisans are seen at work with curious details of their methods and tools. Potters, indeed, had attained eminence in their art, and the Egyptians had certainly a knowledge of chemistry, as the samples of their glass blowing and the stone pictures of tools, forceps, blowpipes, etc., prove. Gold was largely used at an early period—between 4000 and 5000 B. C., as we find from some newly discovered and ingenious weighing balances. Many centuries older than the pyramids, which date from fifty to sixty centuries back, we have examples of engineering in Memphis which could not have been constructed without tools and necessarily an acquaintance with metals. The word "metals" is of Semitic origin—the Hebrew word "metals," to forge, indicates an early acquaintance with the fusing of ores and the malleability of metals. How these early primitive people discovered the use of things must, of course, have been through their needs, particularly after they left pastoral and tent life and began to build cities. The Arabs are credited with being early acquainted with the alloys, though alchemy, as a science, dates only from the sixteenth century.

THE *Railway Age* of the 18th ult. has an interesting article on the Correspondence Schools car. This enterprise is a new departure of the management of the International Correspondence Schools of Scranton, Pa. It is intended to direct public attention to the work of the schools and goes on a tour through the principal manufacturing cities of the country. The outer construction of the car is similar to that of all modern passenger railway cars. The interior is divided into compartments; the reception room (fitted as a library), sleeping sections, a storage room for clothing, books and supplies, with the customary conveniences, including hot and cold water, etc. The president of the School, Mr. R. J. Foster, is in charge of the car, with an assistant, Mr. John G. Forsyth, and six representatives of the School. The plan is to locate the car for a time in the immediate vicinity of large manufacturing establishments, to give those interested a practical demonstration of the method in which the work of the Schools is carried on. The scope of these Correspondence Schools embraces instruction by correspondence in civil, mechanical, electrical, hydraulic, locomotive and railroad engineering, mechanical drawing and the ordinary English branches. This institution is now in its seventh year. Its operation requires the employment of over 400 different persons. It is possible that the itinerary of the car will be extended to the Pacific coast.

WITH the recent passage of an ordinance bill by the City Council of Kenosha, Wis., the last link in the most extensive interurban electric railroad line in America was welded. Within a few months it will be possible for a trolley car to travel uninterruptedly from Chicago to Green Bay, Wis., a distance of 201 miles. The electric line parallels the Milwaukee division of the Chicago & Northwestern Railroad. The Milwaukee, Racine & Kenosha Co. is now operating nine cars, one every hour, between Milwaukee and Kenosha. It charges half the fare charged by the Chicago & Northwestern, but the service is much slower.

THOS. A. EDISON writes: "I wish to protest against many articles appearing in the sensational newspapers from time to time purporting to be interviews with me about wonderful inventions and discoveries made or to be made by myself. Scarcely a single one is authentic, and the statements purporting to be made by me are the inventions of the reporter. The public are led from these articles to draw conclusions just the opposite of fact. I have never made it a practice to work on any line not purely practical and useful."

A New Short Beam Assay Balance.

To meet the constantly increasing demand for more accurate and rapid assay balances, Wm. Ainsworth of Denver, Colo., is now making a balance, shown in the accompanying illustration, which has so far proven equal to the most exacting conditions and severe service.

The balance is sensible to 1-200 milligramme and, at this increased sensibility, weighings can be made in from one-half to one-fourth the time of those made on any long beam balance. It can also be adjusted to weigh to 1-400 milligramme when extreme accuracy is alone sought for.

In making a balance of this accuracy it is evident that too much care cannot be taken in adjusting and dividing the beam, and, therefore, the construction of the beam of this balance has necessitated the construction and use of improved and accurate machinery and test instruments.

For adjusting the beam to equilibrium there is placed upon the center edge, back of the beam, a star wheel on a finely threaded arbor; by moving the wheel backward or forward, it moves along the arbor and thus makes this adjustment. The position of this adjusting device, back of the beam, allows the rider to be used over the center of the beam.

The new skeleton hanger used on this balance has been designed with a view to making it as light as possible and still maintain the required strength. It also has the advantage to be gained of having a single point of contact with the pan rest, which greatly eliminates its liability of sticking to the pan rest when dirty and causing the beam to throw to one side or the other. The counterpoised sliding door has been removed to better illustrate the working parts of the balance.

A catalogue fully describing this and other balances manufactured by Wm. Ainsworth can be had upon application.

Mining Summary.

CALIFORNIA.

Amador.

On the Benoist ranch a tunnel is being run and a 10-stamp mill is nearing completion.

The Union Con., at Wieland, is running thirty stamps on ore from the 400 and 500 levels.

Supt. Ross will remove the machinery from Pioneer to the Ironbound mine. When this work is completed sinking will be resumed. The present developments on this property are quite satisfactory.

The tunnel on the Imperial is in over 40 feet and is being pushed in vein matter from 60 to 70 feet wide and 100 feet in depth from surface that prospects favorably. The owners will erect a mill after some further development work. The property is on the King ranch, near the Ballot mine. W. H. Chestnutwood of Stockton is principal owner.

Developments at the Central Eureka are progressing. The shaft is being sunk from the 900 at the rate of 5 feet in twenty-four hours. A drift was started to the north on the 900 last week. On the 600 level they are drifting in a fine body of ore. A crosscut run into the ore body 25 feet at this point did not penetrate the footwall.

In the Central Eureka on the 600-foot level a good body of ore was discovered.

The Robinson mill is running on ore from the Iron Mass mine. They have put in a concentrator and blanket plant and will give it a thorough test before determining to put up a mill on their own property.

Ledger: The Zeila mill is running as usual and about the usual number of men are kept busy in the mine. The Zeila has not made a sufficient profit above running expenses for the past year to declare a dividend, but operations are continued in the hope that better values may be encountered.

Dispatch: The Anita is bulkheading the drift at the 500-foot level to stop the flow of water into the shaft, after which sinking will be resumed.

Butte.

E. Brooks of Enterprise sold to Avery & Murray the Bright Star and Little Monarch claims. A year ago Murray Bros. purchased the Crystal Peak, at Enterprise, and replaced the 4-stamp mill with a 10-stamp, which is in constant operation.

Calaveras.

Five men are at work on the Murphy mine, near Murphy's, and are meeting with success. J. D. McDonald is taking out good rock near the Buckhorn.

The Champion mine, at West Point, has resumed operations. Gibson & Manley are taking out good ore.

Beauchemin & Co. are running night and day at their mine on Valentine hill.

The Angels *Echo* says that one-half a ton of rock taken from the Collier mine, six miles from Murphy's, was sold to the Utica Co. for $300.

Echo: Mr. Baumhogger, owner of the Great Western mine, near Mokelumne Hill, will add five stamps to his mill. The ore is getting richer as developments are made and the vein increases in width with depth. The last clean-up was very good.

The shaft in the Esperanza mine at Mokelumne Hill has reached a depth of 900 feet. The *Prospect* says that while sinking an improved class of ore was discovered. The ledge is about 70 feet in width. It is said that thirty stamps will be started about April 1st.

A strike is reported in the Hedrick gravel mine, near San Andreas.

At the Mayday mine, near Murphys, the tunnel is progressing rapidly. Two shifts are on night and day and the power drills keep up their work. The series of mines which will be opened by this tunnel can each be operated through the tunnel, and the ores brought to Murphys creek, where it is expected a mill will be built.

The Round Butte placer mine has been reopened, and is awaiting water supply to begin washing gravel.

Del Norte.

W. Kemp is expending money on claims located by himself and for others in the Low divide.

El Dorado.

(Special Correspondence).—The Church M. Co., which resumed work recently on its property, is making good progress. A new shaft is going down near the east line of the mine, and a tunnel is being driven near the mill. The Church mine was a dividend payer from its outset and so continued for nine years in a good grade of ore. One year ago a new shaft was started and the ore was deemed too low grade for profitable working in a 10-stamp mill, and in the dilemma of erecting a larger plant or closing, the latter plan was adopted as a temporary measure.

Placerville, March 22nd, '98.

(Special Correspondence).—There are three slate quarries in El Dorado county which were worked from 1888 to 1895, and have produced annually about 5000 squares of roofing slate. They are the Chili Bar quarry, containing forty acres; the Kelsy quarry, containing forty acres on the slate belt, and the San Francisco slate quarry, containing 310 acres, all slate land. The slate belt is over 1000 feet in width and two miles in length, with a height of 1500 feet from the river. These properties are within four miles of Placerville.

The quarries are opened with faces of a width of several hundred feet. The quality is equal to the best European and Eastern slate; it has been proved theoretically and practically. The slate was analyzed by Mr. Atwood, whose analysis was published at the time in the MINING AND SCIENTIFIC PRESS. At present none of the quarries are working. The reason is: The quarries were opened and the slate introduced on this coast by people with not enough means to continue work. While the demand has always been greater than the product, the parties could not get enough money to open a large enough space in the quarry to fill the demand.

Slate quarrying on this coast would be a profitable business if properly handled; the supply could be made equal to the demand if capital would interest itself. The statistics of 1897 state that in the Eastern States the product was over 700,000 squares.

Placerville, March 21st, '98.

L. H. Monroe, near Soapweed, has extended his tunnel 400 feet and begun sinking. The prospects are encouraging.

Nugget: W. R. Pearson has struck good ore in the Mount Hope mine, near Grizzly Flat.

An additional force was put on at the Grizzly gravel mine. The property has a 10-stamp mill.

Nugget: A 7½-foot ledge was uncovered at the Grover Cleveland mine.

Elzy & Brown will open the Gray mine at Gray's Flat.

Oakland capitalists are opening the Houx quartz mine near Shingle Springs.

The Grossman and Rose Kimberly mines, in the western part of the county, are showing good prospects.

The Schneider mine, near Diamond Springs, is to be reopened.

The Oma mine, near Fairplay, has been bonded to M. Mendenhall, who is running a tunnel on the vein.

Kern.

The Independence mine, at Randsburg, has been sold to C. C. Thomas and E. W. Woods for $1500. H. C. Oakley bought the Boston.

A 14-inch vein of ore has been encountered in the Camperdown.

Mono.

Bodie employs 100 miners at $4 a day. There are between twenty and forty stamps dropping steadily that turn out two bullion shipments per month.

Nevada.

(Special Correspondence).—Work on the St. Gothard Con. group, near Columbia Hill, is progressing rapidly. The old 1800-foot Delhi tunnel has been put in good condition and 130 feet of new work added. The company found an ore body in the new work. They have, however, begun work at a new place, 300 feet back from the face, and started a crosscut. The work is carried on night and day. The property will be thoroughly developed and its merit determined before any steps are taken toward building a mill.

Nevada City, March 22nd, '98.

(Special Correspondence).—Work on the Judge Caldwell property, to be known as the Stanford mine, is progressing. After years of idleness the present company took up the property under bond and will give it a thorough test. The shaft has reached 400 feet on the pitch of the vein, which is 4 feet and a fair grade of ore. A drift has been started south at the 100 level. The company consists of J. H. Neff, W. W. Montague, G. McNab and Coleman Bros.

Nevada City, March 22nd, '98.

Telegraph: A cleanup from the Wisconsin mine, from No. 5 south drift, of thirty-five tons yielded $21 to the ton.

Supt. Phillips is opening the Gold Bar and O. K. mines and putting in machinery capable of going down 600 feet, which depth will be sought with all possible haste. The mines are two and a half miles from Grass Valley.

Union: The gravel claim between the McKillican and DeNoon mines, near North Bloomfield, is being worked by McIver & Co.

The Jumping Santapede claim, near Nevada City, was sold to Tickell & Shockley. The latter is Supt. of the Phœnix mine and is backed by Eastern capitalists. It is the purpose of the new owners to work it in conjunction with other claims in their possession.

Placer.

(Special Correspondence).—The Paul mine, owned by Paul, Kirby and others of Auburn, in prospecting recently struck some good rock, showing free gold and sulphurets. The last crushing from this mine, at a custom mill, showed $8 per ton gold, with the value of the sulphurets to be learned.

W. P. Black of the Cleveland M. Co. of Cleveland, Ohio, has been examining properties in this district, with a view to purchasing.

Mrs. Roberson, two miles from Auburn, has discovered a good quartz ledge on her farm. On Mr. Druce's property the quantity of float quartz found, and the particles of gold to be found after heavy rains, gives evidence of a good ledge not far distant.

J. Moran uncovered a 6-inch ledge on his farm which returned him $5 per ton, but at a depth of 50 feet water drove him out.

On the Freeman tract, near Auburn, A. R. Green has sunk 30 feet on a 6-inch ledge which shows free gold.

Auburn, March 21st, '98.

The Gold Blossom, near Auburn, has a good body of ore and the 10-stamp mill is running night and day.

The mill at the Mountain Maid quartz mine, near Colfax, is running sixteen hours a day. Water is very scarce.

The Breece & Wheeler Co. at Bath has twenty men on the pay-roll. Some new ground is being opened and enough gravel is mined to keep the mill running about half the time.

Sentinel: At the Morning Star gravel mine the company has sixty-five men on the pay-roll. The Morning Star has been one of the largest bullion producers of the State. The dividend for March was No. 87. The main bedrock tunnel is considerably over 4000 feet. The gravel is crushed by a 10-stamp mill. About 100 cars of gravel are mined during each twenty-four hours. The January clean-up from the Morning Star was on exhibit at the recent Mining Fair. It weighed 1555.94 ounces and was valued at $28,754.70.

At Big Dipper gravel mine men are converting a hydraulic pit north of the mill into a reservoir, which will have an area of over ten acres. The 10-stamp mill is running steadily. About seventy men are employed and 140 cars of gravel mined in twenty-four hours. C. Waterhouse is Supt.

At the Occidental gravel mine, near Grizzly Flat, the distance to bedrock from the surface is 347 feet. A number of prospect drifts have been run. W. Cameron is Supt.

The Pioneer M. Co. in the last nine months, June to February, inclusive, earned $105,487, crushed 6311 tons of rock, which averaged $17.05 a ton, and carried to the surplus account net earnings of $52,922. This is equivalent to over 50 cents per share (par $10). To be more exact, the mine has earned for the stock in the last nine months 5.29 per cent. The gross returns of $14,160 for February—twenty-eight days—were, with one exception, the largest of any month since last June, while the 940 tons crushed give evidence of improved water supply; it was the largest month's crushing since last summer.

Plumas.

The Yick Lee Co. work ten men in their claim on Long's Bar.

The *Independent* says that C. Girand took out $600 in one week on Indian Bar.

San Diego.

Union: The American Girl G. M. Co., composed of H. H. Markham, Z. H. Lowman, T. Johnson, G. H. Coffin and F. S. Daggett, which recently purchased a group of claims, chief of which is the American Girl mine, is showing more activity than any other new company in this section. The properties of the American Girl Co. are situated about four miles northeast of Hedges, near the Golden Cross mine, and much development work had been done on them before they were sold. It is proposed to develop them extensively without delay. The ores of the American Girl are similar to those of the Golden Cross mines, low in grade but extensive in quantity.

The 10-stamp mill at the Helvetia mine, near Julian, is working on ore said to assay $22 per ton.

The San Diego *Sun* says of the Golden Cross properties at Hedges, which were sold a year ago for a trifle over $1,000,000, that a conservative estimate of their present value is $4,000,000. Since C. W. Pauley took charge last July he has paid the defendants, Jas. Spiers et al, $70,000.

It was agreed that the receiver should retain control of the property as long as he paid at least $7500 per month to the defendants on the $260,000 indebtedness. He has done more, and now that the property is paying $20,000 net per month, he will wipe out the entire indebtedness in a much shorter time than at first contemplated.

The mines give employment to 214 men, and the monthly expenses are $250,000. The 100-stamp mill is running day and night, and the repairs are completed on the 40-stamp mill.

In June, '97, the Golden Cross M. and M. Co. sold its interests to the Free Gold M. Co. for $1,000,000 and the debts then due Jas. Spiers et al, amounting to $260,000.

The shaft on the Crown mine is down 600 feet and 200 tons are taken out daily, while the ore is increasing in value with depth. On the Cross mine the 500-foot level has been reached, and the ore is being taken out practically as rock from a quarry.

In the Queen mine they are down 500 feet. This is the richest of the group, but no ore has been taken out of this mine since July.

The miners at Golden Cross get $3.50 per day.

It is known that Col. I. Trumbo is one of the owners of the Free Gold Co., but as it is a close corporation the other owners are not known. It is generally believed that J. D. Spreckels, A. G. Gassen and Receiver Pauly are interested.

Shasta.

The Mullen and Watts mine has ore amounting to between $35,000 and $60,000 on the dump.

Copper ore has been discovered on the Backbone, near Kennet.

McDaniels and son made a sale of mining property on Muletown mountain last week to M. Deming. It is his intention to develop the property immediately.

Democrat: D. W. Dunham is extracting good ore on Mule mountain. He has considerable ore that will go $100 per ton free gold.

M. Page has a number of men at work on promising prospects at Mule mountain.

The Princess hydraulic mine is running steady since the recent rains, as is also the Chapman.

C. Butler of Delta had twenty tons of ore worked which yielded good results. He will ship ore to the Keswick smelter.

Free Press: The Milkmaid M. Co. at French Gulch has resumed sinking in the 100-foot shaft which was put down from the mill level. The mill is running steadily on good ore.

The outlook at the old Washington is encouraging. All of the work is being done by leasers, but after April 1st all leases will be canceled and the company will resume operation of the property.

All the leasers have made money. The Blagrave Bros. took out $2000 in a few days in the upper workings. J. L. Cannon has been working in ore of like value in the level below the Blagrave Bros.

A force has been put on in tunnel No. 6 of the Niagara mine and the mill will soon resume operations.

The lower levels of the Gladstone mine show remarkably good ore. The mill is running.

Work in the Altoona quicksilver mine is being prosecuted vigorously, water no longer interfering with the work. Last season the output amounted to 352 flasks.

F. E. Hunter is developing a quartz mine near Middle Creek station.

Near Copley a rich strike was recently made of a small ledge 15 to 18 inches wide, carrying high-grade free gold ore. The *Free Press* says that assays made along the vein vary from $500 to $720 a ton.

The Gold Rose, near Castella, has a tunnel 83 feet on a 16-inch vein. The rock has not been tested, but shows up well in free gold.

A 40-foot tunnel has been driven on the Blue Bell mine on Castle creek. The rock assayed $7.50 a ton. There are over 150 tons on the dump.

The Mountain Copper Co.'s annual report for 1897 shows that the outlay on new works has been $207,545, of which $195,220 was spent at Keswick, Cal., and the remainder at Elizabeth, New Jersey. Stocks have increased during the year, and the directors are satisfied with results. The yield of the ore in both quantity and quality has come up to expectations. The total quantity taken out has been 105,060 tons—an average of 550 tons per working day. The proportion of copper was, in the aggregate, equivalent to 14,129 tons of copper. The net profit was $315,730, out of which an interim dividend was paid on Oct. 1, '97. It is proposed to pay on the 31st inst. a further dividend of 2½ per cent absorbing the same amount, which will make 5 per cent for the year.

The *Searchlight* says that a strike was made in the Washington mine at French Gulch, which cleaned up $20,000.

Siskiyou.

The Siskiyou mine on Klamath river cleaned up $10,000 and is still worked with a good supply of water.

The Chicago Co., owner of mining property on Klamath river, in the Happy Camp district, will purchase more mining ground in that section, including the Elliott mines.

E. G. McConnell and Dr. Chismore will reopen the old Pacific mine at the mouth of Humbug creek, in Klamath river. A. Smith will be Gen. Mgr.

The Blue Gravel mine has a good supply of water and keeps thirty-five men employed, with probability of giving employment to more men soon, when well opened. When the new shaft is clear of water a crosscut will be run to ascertain the width of the pay channel, supposed to be 300 yards from bank to bank of the ancient creek bed.

News: Two hundred and fifty feet of the new 1000-foot tunnel in the Spencer mine has been completed. Allen Bros. & Owen have a 6-inch vein of high-grade ore at their mine in Tuttle gulch. C. Hutchinson has purchased the placer property and water rights of Swill-up creek at Cottage Grove. It will be worked on an extensive scale.

Wingdam mining on the Klamath will begin earlier this season than usual. The river is already at low water mark and the indications are that this will be a profitable year for river mining.

Capt. La Flash keeps his 3-stamp mill at work on paying ore. The Jillson and Roberts are also doing considerable work, which, with the mills, give employment to about forty miners.

The Pacific mine, below the mouth of Humbug creek, owned by McConnell & Simmons, will be operated this season by E. G. McConnell of San Francisco. He is fitting up the property for work at an early day.

Work is progressing satisfactorily on the Haze Hazlitt mine, near Henley. The tunnel is in 500 feet on a 6-foot vein which prospects from $12.50 upwards.

The Fort Jones *Reporter* says that W. H. Taylor of San Francisco, supposed to be acting for the Risdon Iron Works, purchased 200 acres of gravel properties near Oro Fino, known as the Eastlick and Wright & Fletcher claims. The price paid is $57,800. The sale includes the water rights of Kidder creek. J. O. Rusby, who has been connected with the Risdon Iron Works, will be Supt.; he begins at once to equip the property for extensive hydraulic operations.

Journal: The Minetta B. mine, near Happy Camp, is being worked energetically for the season's run.

The Aromas Co., Salmon river, is crowding work to start the giants.

The Siskiyou Con. Quicksilver M. Co., working the cinnabar chimneys at the head of the west fork of Beaver creek, will resume operations during the coming summer.

The Benz Bar mine, in the Honolulu district, Klamath river, is hoisting pay gravel day and night.

The Vesey Creek Co., at mouth of the creek in Klamath river, will soon be ready to commence mining the river, to run day and night.

Vogan & Mathews will start work in the Classic Hill mine, Happy Camp, in about a week.

Trinity.

Day & Skinner cleaned up $1600 at the East Fork mine, near Weaverville. Skinner's previous clean-up amounted to $9000. At the Enterprise, development work is carried on with encouraging returns.

F. Bighouse sold his one-third interest in the Grizzly quartz and Bighouse placer claims on Coffee creek for $4000.

Leasers on the Brown Bear mine shipped 4500 pounds of ore to the smelting works and their returns were $1400 a ton.

The Indian Creek mine at Indian Creek since the last storm is running day and night.

Tuolumne.

(Special Correspondence.)—The Mullin property, one mile north of Tuttletown, abandoned years ago, was recently secured by new owners and will at once be actively worked. The 400 foot tunnel will be cleaned and retimbered, then depth will be sought from breast of the tunnel. Geo. Blake, whose work in other mine developments has been successful, will conduct the work.

The Belle has been crosscutting at 300 to the hanging and footwall. They have cut a vein 50 feet wide, part of which is a strong body of ore in which gold is perceptible.

The Gagnere is running twenty stamps on good ore, from a good sized vein.

The Arbona, since the rains, has again started its ten stamps. The activity in mining throughout the county is growing quite perceptibly.

The Bonanza G. M. Co., twelve miles south-

east of Sonora, will begin work at once putting the old 147-foot tunnel into shape and will push development work. The property is on the mother lode. The company will put in power drills. J. L. Bryson of Sonora is the Supt.

Sonora, March 21st, '98.

Banner: A. M. Drew and associates have bonded two mines, one at Tuttletown and one near Groveland. They will commence operations at Tuttletown in a systematic way.

The other will be manipulated as soon as the first is in activeness.

The Big Oak mine, in the Groveland district, is showing up well. It is being developed by the Tuolumne D. Co., composed of Fresno capitalists. N. W. Moody is president. The vein is large and yields gold free and in sulphurets.

Construction of the 10-stamp mill at the Sell mine near Sonora goes on. This property is also under the able management of the above named company.

The Grapevine canyon mine, seventeen miles from Sonora, has a vein 2 to 4 feet wide, and a tunnel on the ledge 100 feet. The ore is ribbon quartz, claimed to yield $8 per ton.

In the Draper mine the shaft has reached 300 feet.

The Gagnere mine, near Tuttletown, made a clean-up last week amounting to $6000.

J. Gillis took out a $1200 pocket at Jackass Hill last week.

The *Independent* says that the Golden Rule, near Sonora, contemplates the erection of a 20-stamp mill.

The Draper mine is going to put up a new hoist, to sink on the rich chute discovered in the winze below the 300-foot level.

The claim discovered recently by J. T. Newcomer is showing up satisfactorily. A shaft is being driven on a good ledge.

The shaft on the Slapjack mine is down 20 feet on a good vein. Milling tests show the ore to be worth $43 per ton.

At the App mine the twenty stamps are dropping on ore taken from the stopes on the deep levels.

Yuba.

The Abbio, at Brownsville, is running on good ore. They are sinking on the ledge, and are down about 100 feet.

NEVADA.

Ore is being extracted from the Berlin mine near Midas which yields good values. Shipments of bullion are made regularly.

The Knickerbocker mill has been overhauled and the new machinery is in place and running smoothly. About 175 men are employed in the mines and mill.

The *Gazette* says that the Black canyon mining properties, near Humboldt House, continue to develop satisfactorily. The quartz carries gold, aside from that contained in the galena and sulphurets. Comfortable buildings for the miners' use have been erected, and, though there is still a foot or more of snow on the mountain, all work is being pushed as rapidly as possible. As soon as fair weather is assured, J. C. Pierson will erect a mill, which he anticipates having in operation before fall.

The Glasgow & Western Expl. Co. shipped a trial shipment of slimes and concentrates from the Star mine, which showed a valuation of $20.60 in gold, ninety ounces silver and 11 per cent lead, the whole lot selling at $66 per ton.

Good ore is coming out of the Mary mine, near Hawthorne. The only drawback is the hardness of the rock.

L. Chiatovich has resumed work on his mines at Chuckwalla.

At the Alex Wise sulphur mines in Humboldt county there are ten men taking out sulphur. They have between 600 and 700 tons on the dumps. At the Emmons property there are four men employed developing deposits of sulphur, which is being found in all of the openings made so far.

The Adelaide Star Mine Co. at Cherry Creek is making regular shipments of ore and concentrates.

OREGON.

W. Wiley, fifteen miles above Glendale, uncovered a quartz vein at his placer diggings between slate and porphyry, containing seams of decomposed quartz and clay, from which he secured single pieces of leaf and wire gold that weighed an ounce.

The Oregon Bonanza mine, near Ashland, is being worked by R. Rogers & Son of San Francisco.

The Oregon G. E. Co. are working the cyanide plant near Ashland to its full capacity.

The Robbins-Elkhorn mine, Baker City, has passed to the ownership of W. E. Zwicky and associates, who also have an option on the Baisley-Elkhorn mine.

Miller & Macy will work a big force with a first-class hydraulic plant near Baker City. Last year this claim yielded well and a $521 nugget was one of the pieces found.

A strike was encountered in the Golden Eagle, Baker City. Active operations began in the mine and mill last week.

W. A. Weatherby has three giants at work on his placer mines at Huntington.

Browning & Hannum are running a tunnel on the Greenback ledge near Jacksonville. They have extracted about $10,000 from the mine during the past year. Considerable work has been done on the Elk creek mines during the past few months. The ore will go from $18 to $20 per ton. The Braden mill in Gold Hill district is running day and night on good ore.

WASHINGTON.

Men were put to work on the Jim Blaine, adjoining the Republic. A working tunnel will be run 1400 feet to tap the ledge.

S. I. Silverman and associates of Spokane bonded three claims at Republic for $12,000. A cash payment of $2000 was made. Work has started. The claims are the Liberty, Pittsburg and North Star.

The Golden Chariot M. Co., near Republic, will put men to work at once and push development as fast as possible. The ledges partially prospected on these claims show a good quality of ore. The Little Cave mine at Republic requires a large pump.

The Erdmann M. Co. began development near Republic last week.

The Rebate, in Republic camp, has been bonded by J. Harvey for $30,000. Work will be commenced forthwith with three shifts.

BRITISH COLUMBIA.

(Special Correspondence).—The number of regular shipping mines in the Kootenay this week increased to fifteen. The shipments this year amount to nearly a quarter of a million dollars.

The properties of the Nip and Tuck G. H. Co. (capital $30,000), near Fort Steele, have been sold to an English company for $20,000 cash and 20 per cent stock.

The Maud hydraulic property has been sold to an English company for $101,000, and will be extensively developed this season.

The first compressor plant to be erected on this coast will shortly be put up on the Dorothy Morton, a gold-copper claim on Phillips Arm, controlled by English capital.

Vancouver, March 20th, '98.

(Special Correspondence).—The old Barker drift gravel claim is working with thirteen men and paying 20 ozs. per day.

J. Perkins has given an option on his quartz claims on Burns Mt. to Montreal people at $12,000.

Black River Exploration Co. has given an option to H. Cochrane of Barkerville on three dredging leases on Manson creek, Domineca district. He is to develop the ground, pay $6000 cash and hold three-fifths interest if expert's report is satisfactory.

Ogden and McKenna have given G. S. Cassidy of Seattle a four months' option on their placer at Eight-Mile lake; consideration $30,000.

Barkerville, March 11th, '98.

The Poorman mine at Rossland shipped three cars of ore. This makes 283 tons shipped by the Poorman since January 1st.

The *Spokesman-Review* says that the Texas mine, near Grand Forks, has been sold to an American company for $200,000, of which amount 10 per cent was paid in cash and the balance is to be paid within thirty days.

O. Johnson has sold the Sadie claim, near Rossland, to a British corporation for $20,000. Work is to commence within two weeks. The lead, which runs across the entire claim, is 22 feet wide.

ALASKA.

(Special Correspondence).—The Berners Bay M. & M. Co. are closed down and are in the hands of a receiver since Dec. 14, '97. The company have settled with most of the labor; the heaviest accounts, however, are yet unpaid. Operations will be resumed as soon as spring opens and the Kensington mine is uncovered. The snow is very deep at present.

The Portland-Alaska Co. at Seward have resumed work on the Horrible mine and will start the mill as soon as water power is available.

The Ivanhoe claims have been placed by Mellin & Co. Preparations are on foot for the construction of a 10-stamp mill. This mine is near the Nowell Co.'s mines.

The Jualin will be running on good ore by April 1st. A few men have been doing development work the past winter and have opened a quantity of good ore.

A. S. Kerry has returned from Lake Bennett. He took over the summit to the head of the lake seventy tons of machinery and supplies.

The mines in the Basin will all be operating, same as usual, as soon as the snow goes.

The trams over the summit at Dyea are not running, contrary to many satements.

Juneau, March 13th, '98.

A new discovery is reported from the interior, near the Little Salmon river, which flows into the Lewes from the east midway between the Hootalinqua and Pelly rivers.

The general characteristics of the Little Salmon river are the same as the Klondike river. It comes out of a low valley, with hills in the background, and is not suggestive of a mineral district.

The gold is said to be coarse and as rich in quantity as was the case on Bonanza at the time of the first discovery.

Twenty-five hundred people camped at the mouth of the Stickeen river struck their tents on the 17th and started for the Glenora. Stimulated by the latest reports from the Big Salmon district, which is beginning to rival Klondike, many will go to that section.

THE KLONDIKE.

During the coming season the Alaska Commercial Co. proposes to get 15,000 tons of supplies up the Yukon river and distribute them among its trading posts from Bering sea to Dawson. Last year 7000 tons were forwarded, but much of this amount was started late in the season, after the Klondike excitment began, and some thousands of tons got no farther than St. Michael. This year the company will have thirteen river steamers moving. Five will be new ones, and four of these will be of 1000 tons capacity. They were built on the Ohio river and have been shipped to Unalaska. They are expected to make four river trips between June 1st and freezing time. The company's new 2500-ton ocean steamer St. Paul, now being built at the Union Iron Works, will be launched April 6th.

IDAHO.

At the Black Cloud at Monarch the plans for a mill capable of handling 150 tons of crude ore daily are completed. The ore from the upper workings will be carried to the mill by an aerial tramway.

The Cumberland mine near Silver City is in a pay chute valued at $75 per ton. On the 200-foot level the vein is 3 feet wide and is copper stained. It assays $362 gold and 119 ounces silver.

Twin Springs Placer Co. bought the Plowman & Branstetter placer ground at Idaho City, including all the water of More and Elk creeks. About 1000 acres are involved. The company will work six giants this year and enlarge ditches this fall, so that twenty giants can run next season.

Statesman: The Leviathan, near Pearl, is drifting on a body of high grade ore; five men are taking out an average of a ton of ore each per day. The Checkmate is shipping ore that assays $100 per ton. The Golden Chest has uncovered a large body of base ore. Ingersoll & Hamlin, representing the company that has purchased the Ireton, Nolan & Stephenson claims on the Payette river, began development. They have decided to build a mill at once.

The Hope mine, near Hailey, cut a vein of about 42 feet of milling ore and 8 feet of shipping ore. The milling ore will yield $10 per ton.

N. Treweek has secured an option on the Lucky Boy mine at Custer City, in which he undertakes to pay $500,000, the option lasting until July 1st next. The property is outputting about forty tons a day that yield good results in both silver and gold.

The following is the return for February of the De Lamar mine: Crushed, 900 tons; bullion produced in the mill, $18,845; estimated value of ore shipped to smelters, $1900; total, $20,745; total expenses, $19,115; profit for the month, $1630. February 8th the first cyanide leaching vat was charged, which the Mgr. says is working satisfactorily and success is assured.

The Kellogg tunnel being run by the Bunker Hill & Sullivan M. & C. Co. at Wardner, is in 1600 feet. When completed it will be two miles long.

The Poorman M. Co. of Florence has purchased the Nero and Ivanhoe and will consolidate them with the Poorman group.

The Blossom, in Florence camp, is said to be showing 18 inches of ore.

The little stamp mill on the Comstock mine in Dixie camp is said to have ground out $12,000 in January and a larger sum in February.

This week 350 men at the Morning mine, near Wallace, walked out upon refusal of a demand that all men employed underground be paid $3.50 a day.

UTAH.

The Alliance M. Co., at Park City, started work again on Monday. The *Tribune* says that there will be no consolidation between the company and the Crescent is now assured. It is estimated that in the prospecting of this ground $500,000 has been expended. The Crescent will start work again next week.

Work on the Golden Gate Extension, at Mercur, has resumed. In the development of this ground a shaft has been put to a depth of 110 feet, and ore uncovered showing a valuation of $4.50 in gold per ton.

The ore body discovered in the Treasure Hill at Tintic is increasing in size and value. Five carloads were shipped last week from the new strike.

Strickley & Co. made a 30-ton shipment from the Amazon.

The 46-ton shipment from the Julia Dean last week was $112 per ton.

The product of the placers of Bingham, on account of the small snowfall, will fall off materially for 1898.

In the Dexter mine at Tuscarora the cyanide plant was started March 15th on tailings that assay $12 to the ton, and of this $10 is saved by the cyanide solution. For two years the tailings have lain in ponds owing to litigation, which has been settled. There are 6000 tons of tailings.

The Julia Dean is producing ore that runs 60 per cent lead and over 100 ounces in silver.

In developing new ground on the old Winnamuck mine at Bingham a large body of copper-bearing lead ore was found.

The Geyser-Marion mill was closed down to permit the installation of improvements that will add 50 per cent to its capacity.

MONTANA.

In the trial of the mining suit at Butte between the Butte & Boston and the Montana Ore Purchasing Co. over a copper claim, the cost of producing Montana copper was testified to by F. Klepetko, relating to the value of copper ore of certain grades and the cost of treatment. During the years 1896 and 1897 he said the value of the fine copper in pig at Butte was 9.55 cents per pound. From a ton of 7.2 per cent copper there would be obtained 102.7 pounds of copper, which would make its value per ton $9.81. From this was to be deducted the cost of treatment, which was given as follows:

Hauling to concentrator	$0 19
Concentrating	82
Calcining	38
Total	$1 39

From a ton of ore .42 of a ton of concentrates would be obtained. The average cost of calcining during '96 and '97 was 98.8 cents per ton and .42 of that amount would give 38 cents, the cost per ton on calcination of the original ton. On smelting there would be a further reduction. From every ton put through there would be obtained 78.788 of a ton. Multiplying this by .42, the result would be .83 of a ton. The average cost for smelting was $3.04 per ton, and .38 of $3.04 would give $2.40 as the cost of treatment of the original ton of ore. The cost of converting at Great Falls was 1.4 cents per pound of copper. He figured out the total cost of treatment of a ton of ore up to the time it was made into fine copper at $3.47. This subtracted from the value of the copper in the ore would leave a net value of $6.34 on the dump. The cost of treatment, he said, included office, general and construction expenses. Copper ore assaying 8.61 per cent had a value of $8.32 per ton on the dump. Copper assaying 10.5 per cent had a value of $10.67 per ton, and 15.08 per cent copper had a value of $18.75 per ton, assuming that it would be melted direct. Copper ore carrying a value of 15.08 per cent would give 269.3 pounds of copper, which at 9.55 cents would be valued at $15.71. The treatment charges up to the point of matte would be $4.18, and converting charges $2.80, making the total cost $6.89 and the net value of the ore $18.73. Copper of 27.81 per cent would have a value on the dump of $38.09 per ton. This estimate included everything except cost of extraction.

Picket: The Gebo coal property, near Red Lodge, has been sold. About $75,000 has been expended in purchasing 480 acres of coal land and development work on the Gebo proposition, and about 12,000 acres of land are yet unpatented upon which filings have been made.

The Longmaid Bros. will put in a steam rocker at Garnet to work the placers of that district. It is the intention to try this ground with the steam rocker, and if rich enough to warrant, a large pumping plant will be instantly installed in some near-by gulch and water carried to the mountain top.

A new engine and hoist will soon be placed on the Nancy Hanks at Garnet.

The Shamrock, near Garnet, is shipping from four to six tons a day.

The Forest struck a vein which measures 2 feet of high grade ore.

The Craig mine, near Whitehall, which has been closed for some years, will at once be reopened. The 100-foot shaft will be retimbered. This is a copper proposition. Yaeger & Cannon of Butte have bonded the property and will push the work.

Maloney & Co. shipped two cars of ore to Great Falls which netted them $2129. The ore averages fifty-five ounces of silver and 49 per cent lead to the ton.

The question as to how many years copper mines at Butte will hold out will be considered practically settled by experiments of the Anaconda Co. In the 1600 level of the Anaconda and other deep mines of Butte ore has been found in places that runs 80% copper. The Anaconda Co. began prospecting some time ago with diamond drill and reached 600 feet below lower levels, which is 2200 feet from surface. Core brought up by drill is said to have run 80%. Core is 2 inches in diameter and 2 feet in length. The Boston & Montana has also experimented with diamond drill, and from points 2000 feet from surface has brought up samples showing great richness. Experiments will be continued to 3000 feet below surface.

At Radersburg a good strike is reported in the Left Hand of a large body of first-class concentrating ore, also a small stringer of quartz that will run high in values.

The English Co. at Radersburg cut a 4-foot vein worth $40 a ton. The camp produces $10,060 a year in placer gold.

In the Alice mine at Walkerville a breast of ore on the 200-foot level is yielding 200 ounces of silver and $40 in gold to the ton.

A one-half interest in the Hard Luck and Fisherman placer claims, near Libby, was sold to J. Baldwin for $1000 cash.

J. Bordeaux and associates have pulled the pumps from the Ella mine on Meaderville flat, near Butte. The shaft, 252 feet, will be allowed to fill with water. It is stated that good ore has been taken out, but that the machinery is not sufficiently strong to continue work on account of the large quantity of water. Work on the Bordeaux and Mascot claims will be carried on.

SOUTH DAKOTA.

The Minnesota property at Rochford will resume operations at once.

Pioneer Times: Doherty & Leonosia, driving a tunnel near Rocheford, struck a large ledge of fair grade free-milling ore.

MICHIGAN.

The Red Jacket shaft of the Calumet & Hecla began producing copper from the 37th level. The shaft is vertical and nearly one mile deep. It was begun in 1889 and has cost to date, with equipment, over $2,000,000.

COLORADO.

The Denver *Mining Record* says that C. Poulot, representing a chemical plant in Paris, has been in the city for five months, purchasing ore of uranium and other rare metals. He has secured but twenty-six tons, which brought an average of about $400 per ton, though some rich dots brought as high as $800 per ton. This metal is characteristic of many of the Gilpin county mines, but is treacherous, occurring in pockets of greater or less extent, with no certainty of finding further deposits without expending more to find it than was yielded by that already found. On account of this uncertainty of supply, Mr. Poulot has been unable to make contracts for future delivery, and steel manufacturers who use uranium are in turn deterred from contracting ahead for more steel than can be made with the metallic uranium in sight. Mr. Poulot says that all he gets is sold immediately, upon the completion of the assay in Denver. In the course of his investigation into the deposits of uranium in this State, Mr. Poulot found the Wood mine in Russell Gulch, Central City district, is rich in uranium, which seems to run more regularly than usual.

The *Republican* says the Smith-Moffat improvements at Goldfield will be rushed this spring, and in addition to the electric power plant and sampling works of 800 to 1000 tons capacity per day, the Florence & Cripple Creek road will make Goldfield a main line station. At present the samplers in the district have considerable advantages in buying ores at the $19 per ounce rate for gold, as nearly all the heavy shipping mines have contracts with mills whereby they get $20 for their gold ores at the regulation charges per ton for treatment.

The Garfield-Grouse at Cripple Creek is producing daily twenty-five tons. The ore is shipped in three grades, running from $80 for screenings to $500 a ton for high-grade smelting ore. Five tons of smelting ore from the Osborne lease on the Porcupine netted $400 to the ton.

The Bird & Gill shipped forty tons of 2½-ounce ore recently and is getting out twenty-five tons daily. Tanna & Lee made their in-

itial shipment, assays on the vein returnig gold values of from four to seven ounces to the ton.

The Sommers on the Vindicator has been sold. As a result of the transfer, an increased force will be put to work at once. The production for last week was four tons of high-grade ore, one car of five-ounce screenings and two cars of $30 ore.

In the Lillie on Bull hill the ore chute produces 1000 tons a month, and this could be increased should it be deemed wise. Last month 2400 tons were hoisted, of which one-half was of an average value of over 2½ ounces.

The London and Cripple Creek Reduction Works at Florence, recently sold under sheriff's sale, will be redeemed before the expiration of the legal term and started up again by the company. The necessary funds have been subscribed and the company reorganized. In addition, a roaster will be erected and additional machinery necessary to the treatment of Cripple Creek ores introduced.

Denver *Republican*: The Anaconda at Cripple Creek is shipping two cars of mill ore a day and a considerable amount of development work is under way. The lessees on the Excelsior are getting high-grade smelting ore from the McQuarrie vein. One carload shipped last week ran slightly better than twelve ounces to the ton. The present workers opened a new level, and have cut into a higher grade chute.

The Garfield Con. Co. will allow the money coming in as royalties from the Garfield-Grouse to accumulate and provide a fund for opening the property on a broader scale after the expiration of the lease.

Babbitt Bros. are making occasional shipments from the Prince Albert on Beacon hill.

Denver *Republican*: The Gold Coin mine in Victor last week reached its 420-foot level. At 200 and 300 feet the Coin had a vein carrying 13 feet of low grade ore and outshipping any mine in camp, but the last hundred feet has shown a remarkable change. Three feet of the vein matter has tripled in value, now running $100 per ton, while the remainder of the lead shows a proportionate increase. Successive levels will be run until the depth of 1000 feet is gained. So far the Coin is a dry mine. An output of 100 tons per day is being kept up, aside from the extensive development work.

At Victor the Jolly Tar, which has been shown to be an extension of the Strong, has steadily produced seven cars of ore averaging $25 per ton since the first of the year.

The Jefferson is leased to the Independence Ex. Co. until July 1, 1898. The bond is for $50,000, and all but $16,000 has been paid.

The ore chute in the Monument was opened about a month ago. It is 6 feet thick and is rich with sylvanite. Twenty tons, averaging $110, have been taken from the strike. The Portland Co. has sued the Strong for ore alleged to have been taken out of the Four Queen's lode and valued at $50,000. The *Republican* says that the Strong will probably admit the taking of the ore and set up the claim of ownership to the vein. Bird & Gill of the Wisconsin are taking out twenty-five tons of $50 ore every day.

The Pick-Up on the Six-Points is one of the new shippers of Bull hill. Small shipments of $40 ore have been made.

The shaft of the American Eagle is down 800 feet and W. S. Stratton will continue until he reaches the depth of 1000 feet.

The Modoc made its usual output of four cars last week, running from $300 to $500 a ton.

Kellum & Carpenter, after reaching the ore in a crosscut at 130-foot depth, upraised 85 feet and drifted 40 feet on the vein, showing a continuous ore body averaging in width 3½ feet and paying from $40 to $2000, with an average of three ounces.

In the Independence mine, near Silverton, several carloads are awaiting shipment. The estimated value of the ore is $50 per ton. The Bonner claim will ship six carloads in early April.

The aggregate output of the prominent Cripple Creek mines is averaging better than $1,000,000 per month. It is said that nine out of every ten of the miners employed in the district are doing prospecting and development work to one that is producing ore. Conservative managements are paying more attention to development work than to production, insuring a gradual increase of output for years.

Last week the Golden Cycle Co. shipped 350 tons of ore coming from an ore body 4 feet wide and containing quantities of sylvanite.

Ore shipments from the Moon-Anchor last week amounted to 100 tons of smelting ore.

Production from the Anchoria-Leland last week amounted to 120 tons of an average grade of ore.

The Fort Wilcox at Cripple Creek has made a valuable strike. In places it shows free gold, but the average of the whole, so far as explored, is estimated at $16 per ton. Hannaum, Brown & Co., operating the Abe Lincoln, are shipping ore each week. The last consignment was fifteen tons. They contemplate sinking for another level, but to do this a new pump will be necessary, which will be placed in the near future.

The Tomboy mill at Telluride, having a capacity of 200 tons daily, has begun operations. There is enough ore opened up in the lower workings to supply the entire plant, but there is a scarcity of water for milling purposes at present.

The Gold and Silver Coin property at Idaho Springs, operated by the Jason M. Co., is shipping gold and silver ore.

The stopes of the Silver Age mine are being worked by Daily & Co. with good profit. Years ago there was a large amount of ore left in this mine that would not pay for handling, which now pays a handsome profit. The Shafter mine continues to put out ore regularly. It has been worked for ten years.

The Woody Co. has leased and purchased a number of prospects on Little Jim creek, near Jamestown, some of which are being developed by sinking shafts and drifting. The company will build a mill of 100 tons daily capacity when it can be decided what process is best adapted to treating the ore of this section.

Post: The Little Johnnie tunnel near Whitehorn was leased for $25,000 for a term of eighteen months to C. B. Wider & Co., who will begin work at once. The development on this claim consists of a 20-foot shaft and a tunnel 100 feet. The shaft shows a 7-foot vein that averages $13 in gold to the ton for the entire width.

The Nancy Hanks was bonded to P. R. Eyke & Co. for $17,000. Forty shifts per month are to be worked and 10 per cent royalty on all ore taken out during the term of lease is to go to the owners. C. W. Burton will take charge and push development.

The Eureka tunnel, with forty tons of ore on the dump, was leased by Wider & Co. for twelve months for $16,000 and 20 per cent royalty. Work on it will continue with increased force.

The East Notaway, near Idaho Springs, down 210 feet, has four levels in pay ore, and is making regular shipments, carrying average values of $75 per ton.

The '76 G. M. Co., at Idaho Springs, makes daily shipments averaging fifty tons; fifty-five men are employed. This property was bought by W. P. Bonbright & Co. last October for $127,500. The company is preparing to change the present equipment to a 40 H. P. plant.

The Virginius mine, near Leadville, is shipping mineral of a good grade. The last lot averages 60 ounces silver and comes from a 2-foot streak. The production of the Ibex Co., makes a steady shipment month after month.

A shipment of forty tons went from the Katherine, on Raven hill. The monthly output of the Anaconda mine is about 500 tons. The Hines lease on the Pharmacist, Cripple Creek, has come into a big body of ore on the 250-foot level, where there is a showing of 5 feet of quartz that averages $18 per ton.

The group on Bull hill, embracing thirty-one acres, was sold to E. Parvin for $40,000.

The Portland is producing ore from the fourth, fifth, sixth, seventh and eighth levels; rock that goes to the smelter will average $80 to the ton. The shaft is 875 feet.

The Colorado King leasing company, after sinking to a depth of 130 feet, returned to the 65-foot level and are driving after the ore chute and otherwise prospecting at that point.

Yost & Co. made a twenty-ton shipment of mill ore that is reported to average $20.

Record: The O. & N. tunnel, at Ouray, has been in good gold ore the past month and the returns will net between $30,000 and $50,000. The shipments will average a car per day of high-grade ore.

One hundred and seventy cars of ore were shipped from Ouray station during February.

The McCarrier Bros. send their pack trains of ore from the Cascade several times a week.

At the Walsh mill, at Potosi, the average output is fifty tons per day. Two pack trains per day come from the Camp Bird mine with concentrates. A three-days' output brought a return of 180 ounces in gold.

Reporter: The Wolftone, at Leadville, continues large shipments of sulphides.

The Maid properties keep up an output of both lead carbonates and manganiferous iron ores. Ground is made to pay that several ago, when silver was above the dollar mark, was thought to be exhausted. The same can be said of Rock hill where large bodies of low-grade carbonates lay idle for years.

Little Ella Hill is conquering the water and in a short time will resume her production.

The production from the Orphan Belle, Cripple Creek, is 800 tons a month.

The Lafayette, on Bull hill, at 400 feet, is cutting into a 6-inch seam of ore that gives average assays of $35 a ton.

NEW MEXICO.

New Mexican: The Red Bandana properties, near Elizabethtown, are producing $80 ore from the Moreno claim at a depth of 180 feet, and $15 ore from the Red Bandana claim. The Moreno ore chute is a recent discovery. The vein is 18 inches wide. The Red Bandana tunnel is in 750 feet.

The Klondike, near Elizabethtown, has attained 160 feet depth. The vein matter has been drifted on 70 feet and no walls encountered.

H. H. Argue will resume work on the Moreno valley placers this month with a dredge. The average value of the ground is said to be 30 to 60 cents per cubic yard.

The Mattie Belle property has been sold to Eastern people. The development work consists of an 80-foot shaft showing a 2½-foot vein, giving from $28 to $87 assay values.

The Aztec mine is again in active operation, under the management of R. C. Wilson. The values of the ore now worked range from $4 to $8 per ton, but drifts are being extended to cut the ore body in the old workings of the mine. The vein in the old workings is 30 feet wide, but the methods of timbering in vogue could not hold the ground.

The Rebel Chief property has resumed operations. The work of retimbering and building new chutes is progressing rapidly. Recent shipments from the James lease on Rebel Chief No. 1 gave $160 per ton values. On Rebel Chief No. 2 the values average $30 per ton. The management of the properties has passed into the hands of Chicago parties.

The Confidence mine at Mogollon is turning out eighty tons of ore per day.

Martyr & Co. have opened a body of pyritic and galena ore near Oak Grove.

Thomas & Johnson, in the Deadwood mine at Mogollon, have a general average of ore running $16 gold and $21 silver per ton.

Over 300 miners and mechanics are now working in the Cochiti at Bland.

All of the iron mines at Gray have been acquired by the New Mexico M. Co.

Two Republics says that J. F. Simmons discovered a vein near Casas Grande, in the State of Chihuahua, from which he took several hundred pounds of silver ore which assays 842 ounces to the ton.

The recent experimental run of the Bland mill proved to the satisfaction of Mgr. McPherson that both the white and yellow values contained in the Lone Star and other Cochiti mines can be reduced by the cyanide process at an expense that will make it profitable to mine and treat the ores of the district that run as high as $4.

The Lone Star mine has paid profits at the smelters after deducting closely transportation charges. Since 1893 it has shipped ore to the smelter that returned about $75,000 in gold and silver. The average value of the ore was $40 per ton. The Lone Star ledge varies in width from 20 to 32 feet.

New York capitalists, represented by S. M. Ashenfelter, paid $1000 for a year's option on the Climax and Standard mines, near Silver City, the purchase price of the properties being $15,000. It is the purpose of the purchasers to actively push development work, and determine the value of the properties without delay. It is said that D. J. Dornan will take charge.

Bell & Davidson, lessees of the Golden Giant mine, near Pinos Altos, have a large force at work and the prospects are good.

Z. Hirshberger, at Pinos Altos, is working fifteen men and making shipments right along with good results.

The Othello and Desdemona, near Cook's Peak, belonging to the Kansas City S. & R. Co. of El Paso, produced 10,800,000 pounds of lead and 81,500 ounces of silver in '97.

ARIZONA.

(Special Correspondence). — The United Verde Copper Co. is operating five furnaces and six converters.

The Jerome Copper Co. is developing some claims south of the United Verde properties. Development work has resulted in finding ore which carries good values in copper, gold and silver. The Venture mine, adjoining this, belongs to the United Verde and is pretty well developed and runs high in silver. It is claimed that 500 tons of ore from the latter yielded $700 per ton in silver.

On the western slope of the Black range (Jerome being on the eastern slope) the Emmett is producing gold ore, working a force of twenty-five men and operating a 10-stamp mill. In the same locality the Golden Gate is being developed by Kansas City parties, who, it is claimed, will erect a cyanide plant.

The Midget is also being slowly developed in the same locality. WASCOTT.

Jerome, Ariz., March 18th, '98.

(Special Correspondence). — Lynx Creek, twelve miles southeast of Prescott, has three stamp mills and several properties under development. Among them are the Pine Mountain, Favorite, Hidden Treasure, Sheldon, Orient, Star and Black Diamond. The Favorite was recently sold to Collins & Co. for $15,000. The Pine Mountain is working under lease to McKinley & McNally. The ores of the district are a sulphide of iron, carrying gold values, and in general are concentrating propositions.

In Big Bug district the Providence Co. is opening the Annie group. The work of development has gone on rapidly. At present the output is measured by the capacity of a 10-stamp mill.

The Red Rock, a prospect, is being fitted out with steam hoist.

The McCabe mine has been developing the past year, with the purpose of opening the property extensively. The product is in the shape of concentrates, carrying mainly gold. This property employs forty men. E. W. Wells is Mgr. and J. J. Coleman Supt.

The Jessie, at Chaparral, is operating a cyanide plant on 10,000 tons of tailings, the values extracted by this method being about $6.50 per ton. The last ten tanks, it is stated, averaged about that amount. The Jessie shaft is 600 feet deep, with levels every 100 feet. One-half of the ground is stoped. The high-grade ore runs from $80 to $250 per ton, the low-grade from $5 to $10 per ton. The property comprises seventeen claims.

The Gold Note mine, at Richenbar, forty-six miles southeast of Prescott, on the Agua Fria river, is developed by a 300-foot shaft, 600 feet of drifts on the third level and 1000 feet on the second. A second working shaft is 200 feet deep. The vein is about vertical, having a width of from 2 to 30 feet. The walls are a schist. The ore is a sulphide of iron and lead and partly free milling. The 10-stamp mill, with concentrators, is operated by electricity generated by water power in the Agua Fria canyon, 800 feet below the mill. A pipe line and flume two miles long conveys the water to the power plant, which also pumps water to the mine and mill, 800 feet above. The Hearst estate is said to be chief owner.

The Crowned King mine and mill and the Gladiator mine and mill are well equipped properties, near together, in the Bradshaw mountains, forty-five miles south of Prescott. The Crowned King has three tunnels, one of 1900 feet, one 800, and another 100 feet. Drift work on the five levels aggregates 5600 feet. A new shaft is to be sunk. The present working shaft is down 1400 feet from the main tunnel. The vein walls are slate. The ores are base, being sulphide of iron, lead, zinc and copper. The ore output for 1897 ran about $26 per ton. A 10-stamp mill is in operation. An attempt was made to cyanide the tailings, but without great success. The mine produces sufficient water for milling purposes.

The Gladiator, on the opposite side of the mountain from the Crowned King, is developed by five crosscuts, which cut the vein at from 75 to 650 feet. The ores are similar to those of the Crowned King, though the vein structure is harder. A 10-stamp mill is in operation. The management contemplates putting in concentrators. Several thousand tons of tailings are said to be worth $30 per ton. The mine has 2000 feet of drifts on the vein. A. Falco is Supt.

The Diamond S. mine, locally known as the Luke property, is shipping high-grade silver ore. The ore is of a siliceous silver-lead nature, of shipping value. The company is J. W. Searles and associates of Salt Lake City. Twenty men are employed. This property is three miles from the Crowned King.

The Oro Bella, an old property in the same locality, is working under lease to Hall & Boyer. A small mill is on the property.

The Rapid Transit, owned by Hinkle of Prescott, is being worked by lessees.

Mr. Searles of the Diamond S. is also developing the Silver Dollar property, adjoining the Diamond S.

The Venezia, fourteen miles south of Prescott, has recently been taken charge of by Tomlinson & Hall under a bond and lease. This property is equipped with a 50 stamp mill.

The Sundance mine and mill are operating under the superintendence of Mr. Donaldson.

Hall & Sullivan of Leadville are erecting a cyanide plant at Goldfield, forty-two miles east of Phœnix, and the Searles G. M. Co. contemplate building a similar plant at the same place. WASCOTT.

Prescott, Ariz., March 15th, '98.

Republican: The sale is announced of the Continental group, near Globe, for $50,000. This is a gold and copper proposition and has upwards of $50,000 in development and hoists.

At the United Globe only the 160-ton jacket will be utilized after it has been placed in perfect condition. There are about 200 men in all departments at work. The force will be increased gradually until about July 1, when 400 men will be on the payroll.

Extensive work begins at an early date on the Black Diamond group in the Dragoons, recently bonded to N. O. Bagge.

The Old Glory in Pima county, in a run of thirteen days, cleaned up over $1200.

The Commonwealth at Pearce employs 100 men. The ores are free milling and the values both gold and silver. The high-grade ore is not milled, but shipped to the smelters.

On the Copper Glance, near Tucson, over 800 feet of development work has been done. The grade of ore is high.

B. Dunlap has bonded one of his mines on the Grand Reef ledge for $25,000.

Yavapai county is working up placer mining operations in the southwest. An Eastern company has secured 5600 acres about Walnut Grove and will work it extensively.

C. T. Hine sold to Perry & Howe a two-thirds interest in a number of mines in Yavapai county for $1500.

It is said that the Swiss Belle M. Co. will shortly put in a new crushing plant at their mines in Santa Maria of sixty tons daily capacity. The company has a cyanide plant in operation.

Work is being rapidly pushed on the South Bisbee Co.'s claims. The shaft is in a formation of iron and lime. It will be sunk 100 feet before any other work is started. At its completion two other shafts will be started and a steam hoist put on shaft No. 1 to sink to the depth of 200 feet.

The Copper King of Arizona, near Bisbee, is down over 580 feet in a hard formation.

The Twin Buttes, south of the Azurite mines in Pima county, continue to show rich copper as depth is reached. The Bain group is showing gold, silver and copper ore.

The United Verde Copper Co. will increase its output from 500 to 750 tons of ore per day.

Three carloads of copper bullion were shipped from the Saginaw last week. The smelter and mill are continuously at work.

Ten of the old eighty stamps at the Vulture mine were started up last week on ore from a new strike on the Vulture property. The vein has assumed widths varying from 20 to 30 inches, with increased values at depth. Considerable ore was taken out during the progress of sinking. This new prospect will be worked with vigor until it is thoroughly developed. The ore resembles the old-time Vulture ore, with the same sprinkling of free gold.

Twelve miles from Vulture is the Garcia, a young property. It has produced considerable rich ore, much of which is on the dump at the mine waiting for the 10-stamp mill to be completed.

J. Philips has started work on his Centipede mine in the Hassayampa district. The ore carries 300 ounces silver and nine-tenths of an ounce gold per ton.

The Casey mine at Dos Cabezas has been sold for $80,000. The money has been paid, but the deed has been placed in escrow. The Climax changed hands last week, the price being $15,000, 10 per cent of which was paid down.

The Copper Bell group near Geronimo has been bonded for $50,000.

The Longfellow mine near Pima has been opened, the ledge showing 6 feet in width. Copper is said to go 60 per cent and $20 in gold.

Work on the lower level of the Azurite mines near Tucson began this week. The ore shows a good percentage in gold, running from $4 to $17 per ton.

The Lost Squaw group near Yuma has been bonded to G. Bradley for $6000. He has let a contract for 100 feet of development work, which will be begun April 1. The deposits are copper and carry some silver and gold.

MEXICO.

One thousand tons of copper bullion and matte were shipped last week from Santa Rosalia to Europe.

Two Republics says that asbestos has been discovered in the valley districts of Oaxaca.

ONTARIO.

The Triumph C. M. Co., capitalized for $50,000, paid up, contains about 200 acres and cost the company $18,500. The plant comprises a steam hoist and 2-stamp mill. The latter is to be discarded and a regular stamp mill will be put on the property so soon as development will warrant its erection. The

management is in the hands of A. B. Upton of Rat Portage.

The Randolph, in the Seine river country, will sink another shaft with a double shift, so as to open the mine ready for a mill. The present shaft is down about 200 feet and the showing is good.

The Foley mine is working regularly. The mill has been running night and day. There is now $150,000 in the company's treasury, which will be devoted to opening up the mine.

The Alice A. mine has two shifts sinking the shaft.

Coast Industrial Notes.

—Hay in San Francisco is selling for $23 per ton, the highest price in fifteen years.

—The Fulton Engineering and Shipbuilding Works of San Francisco are turning out four fine steam vessels for the Alaska trade.

—From Sydney, N. S. W., the steamship Alameda for San Francisco has on board £500,000 in gold. The amount forwarded in the last eight months aggregates $17,500,000.

—The output of petroleum at Summerland, Santa Barbara county, Cal., is increasing. The *Advance-Courier* says: Sixty carloads, 8000 barrels of oil, left Summerland this month.

—The annual ruin of the California fruit crop is announced as usual. The losses by frost, etc., are always heard from. Later on will come more favorable reports and, ultimately, a supply of fine fruit.

—At Marysville, Cal., last Monday, the Blue Lakes Water Co. connected with the power plant of the Yuba Power Co., which produces its current from generators operated by 2800 inches of water under a head of 295 feet, twenty-three miles distant in the Sierra Nevada.

—The Pacific mill at Tacoma, Wash., the largest shingle mill in the world, operated by Metcalf & Wade, was destroyed by fire last Tuesday. The property is owned by the Sather Banking Company of San Francisco and its loss will be about $100,000. There were 3,000,000 shingles in the kilns. There was no insurance on stock.

—Prof. Frank Soule, dean of the College of Civil Engineering of the University of California, and Instructor L. E. Hunt have recently been testing the strength and quality of California marbles. The results of the experiments, says the *Times*, show that the California marbles possess remarkable strength. They are crushed at a pressure of from 250 to 1000 pounds to the square inch—more than twice the strength of foreign marbles.

—The Fresno, Cal., *Expositor* says the last mile of wire of the power line between Fresno and Hanford of the San Joaquin Electric Co. is put in place, and the line is now ready for use. It will be April 1st before the extension will be in operation. The delay is caused by the electric supply company being unable to supply the motors and step-down transformers in time. This is the longest transmission line in the United States, and electricians are watching the outcome of the venture with much interest.

—Last year an American firm secured a concession from the Royal Government to construct a railroad in Corea, the first and only one in that country, and its construction and equipment have gone steadily forward. The railroad is of the American standard gauge—4 feet 8½ inches—and extends from Seoul, the capital of Corea, in the north, to Chemulpo, the chief seaport, in the south, a distance of twenty-five miles. The locomotives are of the six-coupled side-tank type, with cylinders 14 inches diameter by 22 inches stroke.

—Regarding the statement in last week's issue of the coming control of the Oregon Short Line by the U. P., a gentleman entitled to speak authoritatively on the matter says: "There is no truth whatever in the current reports of the absorption of the Oregon Short Line by the Union Pacific by means of an issue of new securities by the latter company. One cannot prophesy what may happen in future years, but there is no reason in sight for any change in the status of the Short Line or its management." Still, the facts are believed to be as previously stated.

—Pres. A. H. Paget of the Chihuahua and Pacific Railroad Co. signed a contract last week with the Nassau Construction Co. of New York City, for the construction of a steam railroad in Mexico, from the sea to the silver mining regions of that country. The total distance from Chihuahua to the Gulf of California is 350 miles, and under the terms of the contract 120 miles are to be completed before November 1. The chief owners of the railway company are Col. O. H. Payne, Moore & Schley and Mr. Paget. The contract is the largest made in this country for steam railroad construction since 1893.

—The California Manufacturers and Producers' Association held its annual meeting on the 23rd and elected directors for the ensuing year. The officers' reports show that the association is prosperous and has accomplished a great deal to protect and enhance the trade and industries of California. Manufacturers no longer need to conceal that the goods they offer in the market are produced in this State. The following directors were elected and will choose officers from among their own number on the 29th inst.: Jas. W. Kerr, A. Sbarboro, W. F. Bowers, Frank L. Brown, L. R. Mead, Chas. R. Allen, A. McLaughlin, J. P. Currier, Samuel McKee, Chas. H. Crocker, E. Everett.

—The progress of the Trans-Siberian railway is such that the Russian press states that the Minister of Ways and Communication has opened freight and passenger traffic on the Obi-Krasnojarsk section and along the Tomsk branch line. A regular service of trains has already been established between Ichelabinsk, in Western Siberia, and the Obi, a distance of 2600 versts. The rolling stock now in use has already proved to be insufficient for the demands made upon it. In consequence of this deficiency, an immense quantity of freight could not be carried, and even now a considerable amount of freight cannot be conveyed by rail. Considerable more rolling stock will be required, and the opportunities for manufacturers to make sales for this road are considered good.

—For several years a railroad over the Andes, connecting Santiago, the capital of Chili, with the transportation system of the Argentine Republic, has been under construction. Several contractors have in these years abandoned the work. The Argentine government has extended its lines to the boundaries of Chili and the Chilians have laid tracks to the snow line of the Andes. M. P. Grace, of W. R. Grace & Co., is reported negotiating with the Chilian government for a contract to complete the roads. If he takes the contract to complete the trans-Andean railroad it will be finished on time. There is another enterprise on foot for the construction of a railroad through another pass in the Andes at a much lower altitude, 100 miles south of Santiago and west of the city of Talcahuano. It is claimed that the expense and difficulties will be less.

Commercial Paragraphs.

THE Colorado Iron Works Co. of Denver, Colo., are installing a gravity tramway on the property of the Golden Star mine, located at Black Hawk, Colorado.

A VULCAN double-rope tramway to handle 300 tons of tailings daily, is being constructed for the El Triumpho mines, Lower California, by the Vulcan Iron Works of this city.

THE General Electric Co. has the contract for the four 75 H. P. motors to be used on the Park & Ocean electric line now building from the San Francisco park to the beach.

THE Union Gas Engine Co. shipped this week two 50 H. P. marine engines to Auckland, New Zealand, by the British steamer Moana. These engines are to be placed in a new 350-ton schooner which is to be used in the meat trade.

FRASER & CHALMERS, Chicago, have become general sales agents for the United States, Mexico, British Columbia and all other foreign countries for the Green Rotary Pressure Blowers. The Green Blower is considered by many the coming machine for use in blast furnaces for the reduction of gold, silver, copper, lead and iron ores.

MINING, Tunneling and Quarrying Machinery Catalogue No. 41, the Ingersoll-Sergeant Drill Co., 26 Cortlandt St., New York City, in green and gold, on heavy plate paper, with tone and sectional drawings and descriptions of rock drills. The illustration and description of submarine rock excavation is new, as is much of the other contents of the book.

THE Colorado Iron Works Co. of Denver, Colo., made a shipment of five carloads of machinery for the Randsburg-Santa Fe Reduction Co., who are installing a 50-stamp mill plant and a sampling mill at Barstow, California. The balance of the machinery will be shipped as soon as completed. They also report shipment of a 10-stamp mill plant of machinery for Dr. Nelson, to be erected near Milford, Utah.

CATALOGUE No. 16, "Gold Dredging on the Feather River, California," from the Risdon Iron Works, Howard and Beale Sts., San Francisco, is a profusely illustrated description of the Postlethwaite dredge, designed and built by them for gold dredging. The large, full-page half-tone engravings are from photographs of the dredger in actual operation, and give an excellent idea of the nature and character of the work. The catalogue will be sent upon application to any address.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

TILE ROOFING.—Joseph C. Bayer, Portland, Or. No. 600,606. Dated March 15, 1898. This invention relates to that class of roofing technically known as "metal Spanish tile." The object of the invention is to provide a thoroughly waterproof roof covering and secure the same to the roof in such a manner as to allow for expansion and contraction. This is effected by a novel construction of the tiles with devices by which two or more sheets of such tiles may be interlocked both vertically and laterally. The roof plate is composed of a single sheet of metal stamped out so as to form a plurality of tiles having an essentially straight and continuous locking seam and engaging tongue upon opposite edges, each of which extends the full length of the whole number of tiles formed in the sheet. The sheet may represent any number of tiles both transversely and longitudinally, there being butts formed across the sheet to represent the overlap and intersection of the tiles longitudinally. In addition to the interlocking edges, a protecting water edge is formed and a nailing strip extends outwardly from the water edge with a flange or tongue which extends from the adjoining sheet so as to fit into the lock.

Personal.

PREST. F. LEONARD of the Comstock Tunnel Co. is in San Francisco.

D. R. OLIVER, Supt. Bonanza mine, Sonora, Cal., is in San Francisco.

CAPT. THOS. COUCH is examining mining property at Mercur, Utah.

CHAS. BUTTERS is expected in this city from South Africa about April 20th.

C. P. GRIMWOOD, Supt. Dreisam mine, Sonora, Cal., is in San Francisco.

F. W. WILMANS, Pres. Rose Creek M. Co., Sonora, Cal., is in San Francisco.

EUGENE KNAPP, late assayer at Comet City, Alaska, is now located at Juneau.

T. T. LANE, Supt. Utica mine, Angels, Cal., is in San Francisco from Ely, Nev.

J. H. GILMORE of the Golden Cross properties, Hedges, Cal., is in San Francisco.

W. R. FISHER succeeds J. L. Grimes as Supt. Gold Blossom mine, Auburn, Cal.

J. C. DIAMOND, managing owner Limpensel mine, Placerville, Cal., is in San Francisco.

L. R. MEAD, Secy. Risdon Iron Works, has returned from Oro Fino, Siskiyou county, Cal.

J. L. JOSEPH, Supt. Gerrymander mine, Sonora, Cal., has returned home from San Francisco.

J. L. BRYSON, Supt. Bonanza G. M. Co., Sonora, Cal., has returned home from San Francisco.

T. B. DILLON, Supt. Columbia mine, Plymouth, Cal., has returned home from San Francisco.

J. HICKEY has resigned as Supt. Dexter mine, Tuscarora, Nev. His successor has not yet been named.

GEO. J. HOFFMANN, mining engineer, who has been associated with Ross E. Browne of this city for several years past, starts in a few days for the Klondike, under engagement to examine some properties for an English company.

Recent California Mining Incorporations.

Covina Yukon D. & E. Co., Covina; capital stock, $20,000; subscribed $5750; J. Villinger, F. M. Chapman, C. E. Bemis, J. K. Bashor, A. Warren, O. J. Osham, M. Baugh.

Mistletoe M. Co., Grass Valley; capital stock, $100,000; all subscribed; W. J. Rogers, T. H. Wilhelm, J. F. Thomas, F. J. Jones, D. E. Morgan, E. B. Power.

Hall Con. M. Co., San Francisco; capital stock, $1,000,000; subscribed $50; M. W. Fox, H. Otersen, J. M. Wright, A. B. Moulder, B. W. Haines.

Douglass M. Co., San Francisco; capital stock, $1,000,000; subscribed $500; F. R. Webster, H. R. Mann, T. C. Coogan, W. L. B. Mills, A. M. Burns.

Monte Vista G. M. Co., Oakland; capital stock, $100,000; subscribed $600; S. L. Potter, F. E. Pierce, F. M. Farwell, G. Burback, J. S. White.

J. G. Peters M. Co., Sacramento; capital stock, $100,000; subscribed $10,000; J. G. Peters, N. A. Lash, S. A. Street, J. J. Dunckhorst, T. M. Lash.

Recently Declared Mining Dividends.

Gold Coin, Colorado, 1 cent per share, $10,000; March 25.

Mammoth, Utah, 5 cents per share, $20,000; payable April 1.

Geyser-Marion, Utah, 2 cents per share, $6000; payable April 1.

Homestake, South Dakota, 25 cents per share, $31,250; payable March 25.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING MARCH 15, 1898.

600,606.—TILE ROOFING—J. C. Bayer, Portland, Or.
600,635.—QUARTZ MILL—Crain & Forbes, Plymouth, Cal.
600,576.—PISTON PACKING—H. Dods, Virginia, Nev.
600,579.—GOLD SEPARATOR—Fulcher & Latta, Stockton, Cal.
600,723.—ROTARY ENGINE—P. J. Johnson, Los Angeles, Cal.
600,832.—LEVEES—Jordan & Duncan, S. F.
600,647.—COT BED—H. C. Niemeyer, Wheatland, Cal.
600,821.—STOVES—W. H. Reiss, S. F.
600,623.—HARNESS BUCKLE—G. Shoenberger, Long Beach, Cal.
600,756.—SPIRIT LEVEL—A. Volswinkler, S. F.
600,815.—NECKTIE HOLDER—D. D. Wadsworth, Escondido, Cal.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey. Strong&Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Books Received.

"A Textbook on Roofs and Bridges—Part IV—Higher Structures," by Profs. Merriman and Jacoby, quarto, 276 pp., Jno. Wiley & Sons, 53 E. Tenth St., New York City; price, $2.50: The fourth of a valuable series, constituting an elaborate treatise on the building of roofs and bridges. Part IV discusses the minutiæ of construction of structures which have more than two supports—continuous, draw and cantilever bridges—with practical illustrative examples. It is observed that the term "kip" is used in this book to denote 1000 lbs. The etymological argument is that as 1000 grains is a kilogram, 1000 lbs. may be called a kilopound, abbreviated into "kip."

A Thoroughly Experienced Mill and Mining Man would like position in Mexico. Speaks Spanish. Is accustomed to Spanish countries. Twenty-five years' experience. Best of references given. Address H., this office.

WANTED.—Position as Superintendent of Hydraulic, Drift, Gravel or Quartz Mine. Twenty-five years' experience as superintendent of gold, silver and copper properties. Best of references. J. C., Mining and Scientific Press.

WANTED.—Position to take charge of a quartz mine. Am a practical miner, and have had charge of a number of properties in different States for the last 20 years. Can furnish the best of references. Address J. D, Mining and Scientific Press.

WANTED.

Position as Assayer, Mill, Mining or Cyanide Man. Have complete assay outfit. Eighteen years' experience. References. Address "M," this office.

Assayer and Amalgamator
WANTS POSITION.
First-Class References. Address ASSAYER, Mining and Scientific Press.

WANTED.
Assay Outfit.
Give lowest cash price, with complete list and condition. W. W., care Mining and Scientific Press.

Assayer Wanted
FOR CENTRAL ARIZONA,
Who has a button and pulp scale or outfit complete. Single man. Must be able to check against smelters and be thorough. Wages $60 per month, with board and room. Must furnish references as to ability as assayer, also honesty, sobriety, etc. Address ARIZONA, Mining and Scientific Press Office, San Francisco, Cal.

WANTED.
Operator for "E" Sullivan Diamond Drill,
SURFACE WORK, USING STEAM.
Apply at once, stating salary expected, and give experience and references. Address The Harqua Hala Gold Mining Company (Ltd.), Harqua Hala, via Aztec, Yuma Co., Arizona.

Practical Running of Dynamos.
A little booklet on the Care, and the Locating and Remedying of Troubles in Dynamos and Motors.
PRICE 10 CENTS.

COMPARATIVE AREA OF CALIFORNIA

COMPARATIVE AREA MAP OF CALIFORNIA

In addition to what the above object lesson conveys to the eye, it might not be irrelevant to state that California occupies a stretch of country on the Pacific Coast that corresponds in latitude with that portion of the Atlantic Coast bounded on the north by Plymouth Bay, in the State of Massachusetts, and by Savannah, Ga., on the south

TOPOGRAPHY OF CALIFORNIA

CALIFORNIA has two great mountain ranges running north and south, parallel to the Pacific Ocean, and extending from the northern extremity of the State two-thirds of the way to the southern end. The one on the eastern border of the State is the Sierra Nevada; that on the western, abutting upon the ocean, the Coast Range. These two ranges meet at their northern and southern ends, and thus enclose the great interior basin, which, 450 miles long and 50 miles wide, comprises, with the contiguous foot-hill region, the bulk of the arable lands of the State.

The southern meeting point of the ranges is Tehachapi Pass. South of the Pass are numerous minor ranges, which have a general easterly and westerly trend. The principal of these is the Sierra Madre, north of Los Angeles, and the San Bernardino Range, east of Los Angeles.

The great basin north of Tehachapi Pass is drained by two principal rivers, the Sacramento in the northern end, flowing south, and the San Joaquin in the southern end, flowing north. These meet midway in the great basin, and as a single stream, flow westward through a break in the Coast Range, emptying into the Bay of San Francisco, and thence reaching the ocean through the Golden Gate. These two rivers are perennial, and are navigable as far as Marysville on the north and Stockton on the South.

The rivers in the southern part of the State are mainly torrential, not navigable, and, with the exception of the Santa Ana, which irrigates the orange groves of the Riverside region, are dry in summer.

The Klamath River, in the northern end of the State, is the only stream of consequence, besides the combined Sacramento and San Joaquin Rivers, that breaks through the Coast Ranges and empties into the ocean.

Many of the most picturesque and highly developed regions are the minor valleys distributed through the Coast Range. Principal among these are the wine and fruit valleys of Santa Clara, Sonoma, and Napa; and in the southern part of the State, the Ojai, San Gabriel, and Santa Ana.

California has a frontage of more than 700 miles on the Pacific Ocean; yet, although its variety is remarkable, and its picturesqueness alluring, it is one of the spectacular features that is hardly ever heard of by the traveler, by reason of the fact that it has been made accessible at very few points by regular lines of travel.

The coast generally abounds in bold headlands and promontories, not unlike the western coast of Scotland in ruggedness, and, in its seaward aspect, presenting a high breast to a foaming, thundering sea.

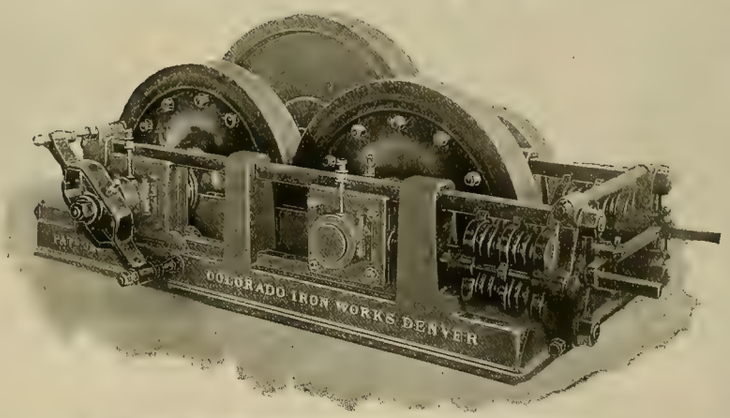
32 FIRST STREET, SAN FRANCISCO, CAL.

THE COLORADO IRON WORKS CO., DENVER, COLO.

Established 1860. ENGINEERS AND MANUFACTURERS OF **Ore Milling and Smelting Equipments.**



We beg to call attention to our

High Speed Special Rolls

as being the most efficient and the most economical machine for fine dry crushing ever placed upon the market. The rolls having

NARROW FACES and LARGE DIAMETERS

can be fed evenly over the whole width of faces with certainty, and hence the faces or crushing surfaces are easily kept true. Descriptive pamphlet on application.

HIGH SPEED SPECIAL ROLLS, WITHOUT HOUSING.

Double rope tramways are acknowledged to be superior to those of the single rope type, and any one contemplating the erection of a tramway should investigate the merits of the . . .

THE ONLY AUTOMATIC TRAMWAY BUILT.

FINLAYSON PATENT AUTOMATIC WIRE ROPE TRAMWAY.

In this system the cost of transportation is brought below any figure heretofore reached. Its tonnage capacity is unsurpassed. Further information on application.

CYANIDE OF POTASSIUM.

Highest Known Grade CYANOGEN.

GUARANTEED 99% and over.

In 112-lb. Zinc Lined Cases.

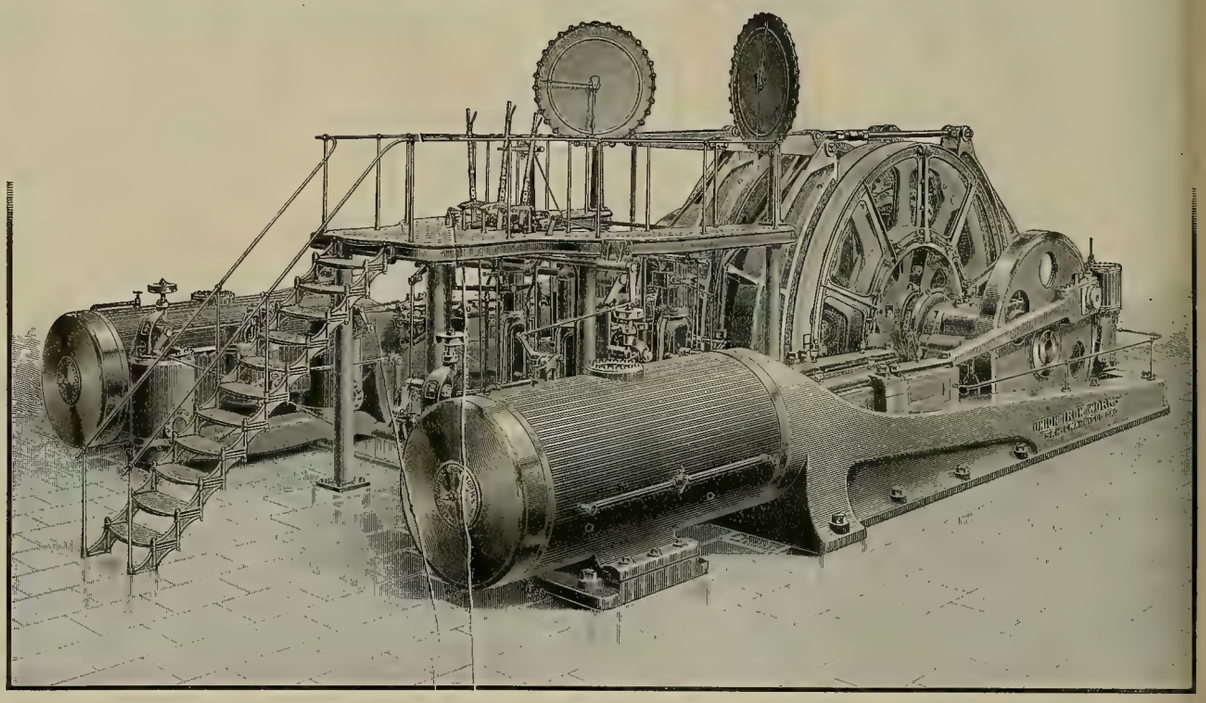
UNION IRON WORKS,

222 Market Street, San Francisco, Cal.



30in. x 72in. Direct Acting Hoisting Engine

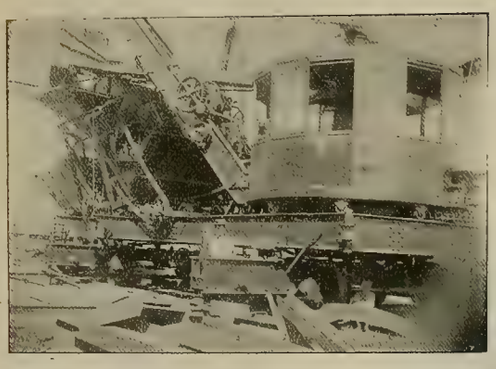
BUILT FOR THE

Anaconda Copper Mining Company

OF MONTANA.

Embodying all that experience and practical working have demonstrated as valuable in this class of machinery.

The brakes, clutches and reversing gear are arranged to be operated by compressed air or steam, by means of auxiliary cylinders which are under full control of the engineer, stationed upon the elevated platform shown, insuring the most rapid work with absolute safety. Shaft hollow forged steel of ample strength and stiffness to withstand any strains; reciprocating parts of steel and are as light as consistent with the duty required; cylinders of the "overhung" type, weight being taken by a guide saddle, which admits of free longitudinal movement, due to expansion, causing no strain on bed plate or foundations; cylinders steam-jacketed, fitted with valves provided with Corliss releasing gear and hand cut-off, enabling the engines to be run economically with reference to the work to be performed; bed plates modification of the Porter Allen type, heavy and substantial, with large foundation base and anchor bolts. A duplicate of this engine has also been furnished the Homestake Mining Company of Dakota.



ERASTUS S. BENNETT, President. SAMUEL DEXTER HAYWARD, Vice-President. D. F. COOPER, Secretary.

PLACER MINING

WITH THE

Improved Electrical Shovel or Dredge and Amalgamator,

—MANUFACTURED BY—

THE BENNETT Amalgamator Manufacturing Co.,

DENVER, COLO., U. S. A.

—WORKS:—

Cor. 36th and Wazee Streets, DENVER, COLO.

Eastern and Foreign Office, Johnstone Building, No. 30 Broad Street, New York, N. Y.
SAMUEL DEXTER HAYWARD, Manager.
Cable Address, "Bennetts." Denver or New York.
Sole Manufacturers (except for the State of Colorado) under all the Patents Covering the "Bennett Amalgamator" Plants.

These plants, being the outcome of many years of evolutionary experiment in the field of their actual operation, are constructed in the most thoroughly substantial and workmanlike manner, of the best material the market affords, with a view to their maximum efficiency, strength and durability; the operating portions almost exclusively of steel, to gauge, and therefore interchangeable, and having been thoroughly tested as to all points, under widely varying conditions, are fully warranted to perform as indicated in the following table:

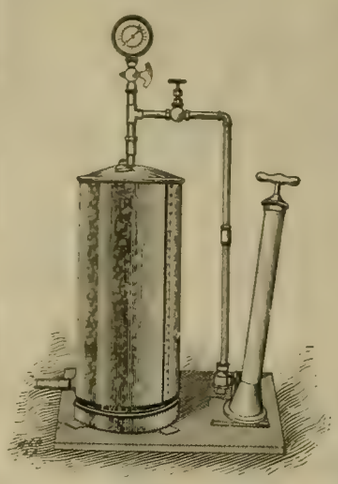
FOR "GULCH," "BAR" AND "HILL" DIGGINGS.

Number.	Capacity in cubic yards of gravel per 24-hour day.	Total operating cost in cents per cubic yard of gravel.	Miners' inches water required where water is scarce or abundant.	Approximate total weight inclusive of power plants.	
1...	2500	2 to 4	25 to 150	150 tons	Single operating plant
2...	5000	2 to 3	50 to 300	200 tons	Duplex operating plant
3...	7500	2 to 2½	75 to 450	300 tons	Triplex operating plant

SWAMP AND RIVER-BED PLANTS.

Number.	Capacity in cubic yards of gravel per 24-hour day.	Total operating cost in cents per cubic yard of gravel.	Miners' inches water required where water is scarce or abundant.	Approximate total weight inclusive of power plants.	
4...	2500	2 to 4	Barge	250 tons	Single amalgamator
5...	5000	2 to 3	Barge	325 tons	Duplex amalgamator

In general terms it may be said these plants consist of the electrically operated dredge and amalgamator, mounted either on steel barges for swamp or river-bed mining, or steel-bodied cars for "gulch," "bar" and "hill diggings," together with the necessary power plants for their operation. Several operating plants, either in close proximity or scattered over a large district, may be operated from a single power station, which may be situated at any convenient point within a radius of a few miles, at railroad depot or where water power can be utilized. The river plants, complete in themselves (each barge containing its own power), are made single or duplex; any suitable number of either can be operated on a river, each independently working its allotted section from surface to bedrock, and rim-rock to rim-rock. All these plants are built with a view to easy transportation, in "knock-down" shape over ordinary mountain roads, and, on special order, the size and weight of separate parts may be still further reduced. In the foregoing table the figure representing the smaller quantity of water required applies to cases where, for any reason, it is desirable or necessary to use the water over and over. The water required may be taken from below the placer, thus obviating the necessity of long ditches, etc. Since these plants neatly pile their debris on the cleaned-up bedrock of the ground worked, they may be said to create their own dump, and hence are enabled to successfully operate on flat ground, or where ordinary dumping facilities are lacking. This peculiarity also renders them independent of "debris laws." The wonderful perfection with which these plants extract the finest, microscopic particles, such as are held in suspension in water, or, when dry, ascend in a gentle current of air, constituting in bulk a perfectly impalpable powder (send for samples), renders them particularly valuable and indispensable in cases where, owing to the fineness of the golden particles, very rich mines are unavailable for profitable working by the hydraulic or sluice processes.



All plants are furnished with duplicate parts and wearing pieces to cover at least two years' constant use, while the life of the plant is conservatively placed at twenty-five years' active service. For further information address as above.

THE GOLD BELT LINE

In Connection with the Denver & Rio Grande.

For information, address
C. F. ELLIOTT, General Traffic Agent,
DENVER, COLO.

GOLD IN COLORADO!

Colorado has within its limits some of the greatest gold mines that has ever been discovered. In Cripple Creek in 1892 there were a few prospectors looking over the hills; in 1895 the camp turned out over $8,000,000 in gold. Leadville, the old bonanza camp and the mineral product of which made Denver what it is to-day, is becoming a big producer of gold. New inventions for working low-grade gold ores, together with the discoveries made to work rebellious ores, have opened up a field for the miners such as they have never enjoyed before, and Colorado has inducements to offer such as no other district in the world possesses; the record of the State in gold production for the last three years speaks for itself. Among the other prominent camps in the State are Telluride, Ophir, Rico, Silverton, Mineral Point, Durango, La Plata, Ouray, Saw Pit, Ironton, the Gunnison district and many others. New finds are being made and new camps are springing into existence every day. The Denver & Rio Grande Railroad, which is the pioneer road of Colorado and which has always been the miner's friend, reaches all the mining camps in Colorado. For elegantly illustrated descriptive books, free, of mines in Colorado send to

THE BEST BOOKS

Are always the **CHEAPEST.** All the latest and best works on **Mining, Metallurgical, Electrical and kindred subjects** can always be obtained through the office of the MINING AND SCIENTIFIC PRESS. Below will be found a list of standard books in their various lines. If you do not find what you want in it, send for catalogue and price list of **Standard Mining Works and Scientific Publications.**

MINING AND SCIENTIFIC PRESS,
330 Market Street.....San Francisco, Cal.

Assaying.—Part I—Gold and Silver Ores.

Third edition; Just Out. Rewritten and Improved by the Author, C. H. Aaron. Embraces 130 12-mo pages, with illustrations; well bound in cloth; 1896. Price, postpaid.....$1 00

Assaying.—Parts II & III—Gold and Silver Bullion, Lead, Copper, Tin, Etc.

Latest edition. Contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter. Price, postpaid.....$1 75

Prospector's Field Book and Guide.

By H. S. Osborn.....$1 50

Roasting of Gold and Silver Ores and the Extraction of their Respective Metals Without Quicksilver.

Second edition. By Guido Kustel, M. E. Contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. Price, postpaid.....$3 00

Modern Copper Smelting.

By Edward Dyer Peters, Jr. Eighth edition. Rewritten and enlarged. Profusely illustrated....$5 00

Practical Treatise on Hydraulic Mining.

By Aug. J. Bowie, Jr. On the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. Price, postpaid.....$5 00

Practical Hydraulics.

A book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers and Irrigators. By P. M. Randall. Contains useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulæ, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules and tables are prepared. Is specially applicable to the Pacific Coast. Price, postpaid, $2

The Explorer's and Assayers' Companion.

A third edition of selected portions of the "Explorer's, Miner's and Metallurgist's Companion." By J. S. Phillips, M. E. A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying and Metallurgy. Price, postpaid.....$6 00

The Metallurgy of Gold.

By M. Eissler. Profusely illustrated.....$5 00

Cyanide Processes for Gold and Silver Ores.

By E. B. Wilson, E. M. 12mo., cloth.....$1 50

Quartz Operator's Handbook.

By P. M. Randall.....$2 00

Skeleton Mining Report.

Or great practical value to miners and mine owners in making a comprehensive report on mining properties. Useful and convenient to mining engineers as a field notebook. Price, postpaid....50 cts.

Stamp Milling of Gold Ores.

By T. A. Rickard, M. E. An actual record of milling practice in this and other countries. Deals with the erection and management of mills, and contains many helpful suggestions to those interested in the extraction of gold from its ores. Well illustrated. Cloth. Price, postpaid.....$2 50

Miners' Pocketbook.

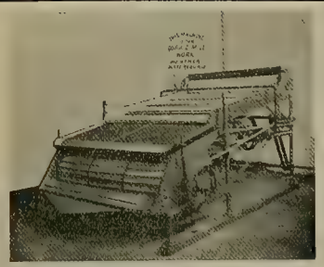
A reference book for miners, mine surveyors, geologists, mineralogists, millmen, assayers and metallurgists. By C. G Warnford Lock. 472 pages, illustrated, flexible leather.....$5 00

Manual of Mining.

For the use of Mining Engineers and Technical Schools. Treating of Preparatory and Exploratory Work, Methods of Mining, Hoisting Machinery, Pumping, Ventilation Shafts, Tunnels, Blasting, Timbering, etc., etc. By Prof. Magnus C. Ihlseng, E. M., Ph. D. Third, revised and enlarged, edition. 548 pages, 8vo., cloth.....$4 00

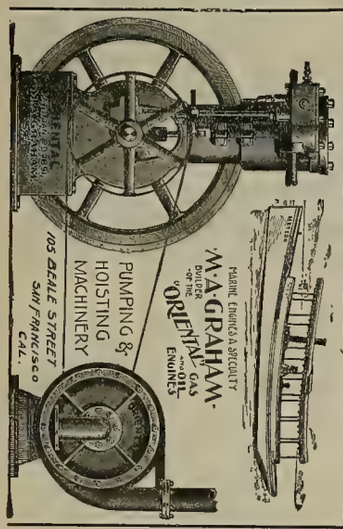
The Lixiviation of Silver Ores with Hyposulphite Solutions.

With special reference to the Russell Process. Second edition. Completely revised. By Carl A. Stetefeldt. Price, bound in cloth.....$5 00



Prospecting IN THE Klondike.

If it is your intention to visit the new placer field of the Klondike region, the best possible preparation you can make is to take a course of instruction by mail in



Prospecting for Gold and Placer Mining.

Established 1890. Inquire of Bradstreet's or Dun's for the standing of The Colliery Engineer Company proprietors. **Send for FREE CIRCULAR containing full particulars.**

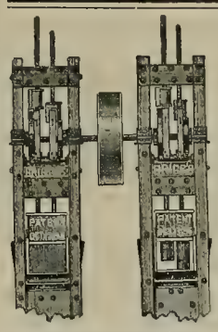
Sole Pacific Coast Agents and Builders of the Celebrated

WILFLEY CONCENTRATOR.



PRICE $450 F. O. B. SAN FRANCISCO.
One of these machines will take the place of two or three belt concentrators of any style and do very much better work.
SEND FOR CIRCULARS.

Some Practical Reasons Why the Wilfley Concentrator Should Be Used in Gold Mills:

1. It will successfully handle three or four times more material than any belt Concentrator made, without exception.
2. It will save more sulphurets in proportion while so doing, and catch any float gold, amalgam or quicksilver which may escape from mortars or plates.
3. It will make cleaner and much more valuable concentrates, thus saving useless expense for transporting valueless material, as also extra cost for treatment.
4. It requires little or no attention when once adjusted and no expert is required to either adjust or run the machine.
5. It will save much expense in power and room, and the first cost of a mill requiring concentrators.
6. It has no expensive belts to crack and wear out, nor complicated machinery to keep in repair.
7. It is the only sensible plan of concentration, as any kind of material can be worked, which is not true of any style of belt machine.

The Wilfley Table is fully covered by U. S. patents Nos. 580,338 and 590,675. Infringements will be prosecuted to the full extent of the law.

PATENTS

DEWEY, STRONG & CO'S PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1873. All worthy inventions patented through DEWEY, STRONG & CO.'S Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

Market Reports.

The Markets.

SAN FRANCISCO, March 24, 1898.

Jobbers report a good distributive demand in almost all lines, particularly in the necessities of life. There is a fair call from outfitters for Alaska and Northwest Territory, but it is considerably less than had been expected by the trade. With the opening of the Yukon a free call for goods is expected to set in. The outfitting by Alaska canneries is quite heavy, which is making itself felt. A continuance of dry weather with a very light deposit of snow on the mountain ranges create considerable uneasiness not only in agricultural sections but also in mining districts. The call for goods from leading points in Washington, it is said, shows a decided increase over former years. This improvement is due to large purchases there by outfitters for the gold fields in Alaska and the British Territory. Notwithstanding the general unfavorable situation here, manufacturers, as a rule, report more orders in hand than at the corresponding time last year, while trade unions report fewer idle men. Ship and steamboat building gives employment to an increased force as does the Government in making war preparations. From all we can learn the Government will increase its force of workmen still more when plans for prospective works have been fully matured.

The local money market is practically unchanged. A light demand is reported, while the supply of funds in bank is large. Unless there is generous and well distributed rainfalls soon, the demand for funds will be light throughout the year. The rates for exchange on New York are fairly steady. The inquiry for mining property is light, although several sales are pending. The *Wall Street Journal* of March 27 states that the gold imports from Feb. 25 aggregate $30,850,000. This includes $5,500,000 from Australia. This heavy importation has not had any material effect on the New York money market, for the bulk went to other financial centers. The Eastern money markets appear to be more or less disturbed by war scare. While everything points to peace, still there are three points of uncertainty: First—The report of the Board of Inquiry on the Maine disaster. Second—The stand of the President on it and the uncertainty how Congress will receive it. Third—The Spanish elections. If the Weylerites get a good working majority, then it means aggression; but if the other side are victorious, then it means peace. With warlike preparations in the meantime, the money market and speculation is kept feverish.

New York Silver Prices.

NEW YORK, March 24.—Following are the closing prices for the week:

	Silver in— London.	N. Y.
Friday	25¼	55
Saturday	25 9-16	55¼
Monday	25⅝	55⅝
Tuesday	25⅞	55⅝
Wednesday	26	56
Thursday	26 1-16	56

	Copper.	Lead.	Iron.	Tin.
Fri.	11 87½@12 00	3 70	9 75@12 00	14 25
Sat.	11 87½@12 00	3 70	9 75@12 00	14 25
Mon.	11 87½@12 00	3 72½	9 75@12 00	14 30
Tue.	11 87½@12 00	3 75	9 75@12 00	14 35
Wed.	11 87½@12 00	3 75	9 75@12 00	14 40
Thur.	11 87½@12 00	3 75	9 75@12 00	14 40

The local bullion, money and exchange quotations current are as follows:

Commercial Loans, % per annum	6
Commercial Loans, prime	5
Call Loans gilt edged	4@4½
Call Loans mixed securities	5@6
Mortgages prime, taxes paid by lender	6@8
New York Sight Draft	12½c Prem
New York Telegraphic Transfer	15c Prem
London Bankers' 60 days	$4.82
London Merchants	$4.81
London Sight Bankers	$4.85
Refined Silver, peroz. 1000 fine	56
Mexican Dollars nominal	45½@46½

SILVER.—Contrary to recent moves, London inaugurated the up-move of the past week, causing New York to respond. This creates the impression that the call abroad is chiefly from India for crop-moving purposes. It also indicates that India has not increased its import duty on the white metal. If crop advices from that country are correct, it is reasonably certain that the importation of silver will be on a more liberal scale than for fully half a decade, which, if events prove to be correct, will cause a much better price for silver before April passes. The crops in India of everything grown are very large, with rice and tea the largest in its history. Our New York advices do not indicate any selling pressure. China is taking very little.

MEXICAN DOLLARS.—The market is very quiet with prices entirely nominal.

COPPER.—The market at home and abroad has held very steady, with European markets showing great strength in the face of recent heavy purchases. The imports into Europe for the first two months of the calendar year are the largest on record during the corresponding months. The varied uses for which copper is used and the increasing consumption in each branch keep stocks down, notwithstanding the increased production. Our New York advices state: "There is superficial evidence of larger business and increased demand, particularly for export account. No particulars as to dealings were made public, but significance was attached to the fact that prices are still very strong all along the line, despite heavy production and the nearness of the opening of navigation, and that the European market steadily hardens.

Our market is quoted as follows:

Ingot casting, jobbing	13¼@—
Ingot " wholesale	13 @—
Sheet copper	16¾@—
Bolt	¼ and 5-16, 20c; ⅜ and larger, 16¼

TIN.—The market for ingot holds strong both here and at the East. The strengthening in silver favors holders of Strait. Tin plate is demoralized under cutting at the East. It looks as if the large manufacturers are trying to drive the smaller out of business. There is a good demand in this city for can manufacture.

The market is quoted in jobbing lots as follows:

Pig	4 75 @ 5 00
Sheet	@ 6 50
Pipe	5 30 @ 5 80

LEAD.—The market has stiffened slightly at the East under an improved demand. Ours is unchanged.

Pig, per lb., jobbing	—@ 15
Plate, I C coke, heavy, per box	$4 10@4 25
" " " light, "	4 00@—

SHOT.—Our market is quoted as follows:

Drop, sizes smaller than B, per bag of 25 lbs	$1 35
Drop, B and larger sizes, "	1 60
Buck, Balls and Chilled, do, "	1 60

QUICKSILVER.—The market is quiet. Exports the past week included 135 flasks for Central America.

Our market is quoted at $40 for domestic consumption and $36@37 for export to the west coast of Mexico.

IRON.—The production of pig in this country is very heavy which causes irregular markets at the East. Our market is fairly steady.

COAL.—The market is steady for all grades. The tonnage to load and on the way from Australia is placed at 160,000 tons. It is thought that our market will not do better later on unless crop prospects improved. The consumption is about normal.

Receipts of coal for the week ending with Tuesday were as follows in tons: Puget Sound 14,534; Departure Bay 4594; Swansea 2187; Nanaimo 4265; Coos Bay 1030. Total 16,610 tons.

POWDER.—The market is firm, with a good demand for mining purposes.

The market is quoted as follows for Hercules: No. 1, from 11¾c to 17¼c, according to strength and quantity; No. 2, from 9c to 11c, according to strength and quantity.

PLATINUM.—The market is steady. Our market is quoted in a jobbing way at $16 per ounce and for scrap $11 per ounce.

ZINC.—The market is steady. Our market is quoted at 10@15c, according to thickness.

ALUMINUM.—The market is steady. We quote in jobbing lots at 45@50c per pound for ingots.

BORAX.—The market is strong, with the East calling for increased quantities.

The market is quoted as follows:

Refined, in carload lots, in barrels	7¼
Refined, in carload lots in sacks	7
Powdered, in car lots, in barrels	7¼
Concentrated, " in sacks	6¾

Chemicals.

Our market is practically unchanged, although there is a firmer feeling for vitriol and crude saltpetre. The consumption of the latter in this country is very heavy, which is depleting supplies quite fast. The East reports the markets as fairly active in about all lines, but with no material change in anything quoted by us.

CYANIDE OF POTASSIUM.—The market is steady. Our market is quoted for chemical pure, 32 cents per pound for jobbing lots, and 29 cents for carloads.

SULPHURIC ACID.—The market is firm. We quote in a jobbing way at 1½c per lb for 66°.

NITRIC ACID.—Our market is reported steady from store at 6½@7c per pound in carboys.

ACETIC ACID.—The market is firm at 6 to 12c per pound from store for carboys, according to make.

BONEASH.—There is a fair home and export demand. Our market is quoted in a jobbing way as follows: Extra, 4c a pound; No. 1, 3½c; No. 2, 2½c.

BLUE VITRIOL.—Our market is strong, with first hands asking more money.

We quote in a jobbing way at 4c per pound.

SPELTER.—The market is quiet but firm. We quote our market in a jobbing way at 5c per pound.

BISMUTH.—The market is firm.

Our market is quoted in a jobbing way at $1.40 a pound.

SODA ASH, 58% (Le Blanc process).—The market is steady at $1.55 per 100 lbs. in a jobbing way.

CAUSTIC SODA, 60%.—The market is steady at 3c per pound in a jobbing way.

HYPOSULPHATE OF SODA.—The market is quiet at 2½c a pound from stores.

NITRATE OF SODA.—Our market is quoted from store at 4c for 95%.

PHOSPHORUS.—The market is steady.

We quote in a jobbing way at 70@75c per pound.

Mining Share Market.

SAN FRANCISCO, March 24, 1898.

A feature of the market was an advance in Sierra Nevada to $1.75 the past week under crossorders, a few shorts filling and some outside buying by speculative brokers and others. These transactions caused a spirited advance, but it gave way when some boom traders tried to put out a line at the advance. The decline was helped by the manipulator by orders to two or three brokers. The decline in Sierra Nevada caused a weakening in the whole list. A few years ago, or before the moneyed public was weaned from the game by no dividends but plenty of assessments, the present showing in Sierra Nevada would have caused the shares to sell at over $10 a share, and the entire list to sell at much better figures than they do now. There is no doubt that the way in which the market and several of the mines have been handled for several years past by the reported mill ring and moneyed inside pool has disgusted outside moneyed traders and financially stranded those that continued to play at the game. It has been heads you lose and tails I win on the part of the former, and, unless the tactics are changed, it will be hard to make more than little deals of from 25 cents to over $1 in one or more of the shares. There is a prevailing belief that the ore found in Sierra Nevada is of larger extent and more valuable than reported, yet fears are expressed that outsiders who hold for a big thing will get assessments only for their investment. It is to be hoped for the sake of the industry that these fears are groundless. Towards the middle of April work ought to be far enough advanced to exploit more advantageously the ore found in that mine and quite an increase in the ore output be reported each week. While the work in several of the mines is said to be quite important, yet the way in which it is being prosecuted, and some still more important not being started, give the impression that it will carry it into the fall months before anything very good will be reported officially which will have the effect of advancing the market value of shares. Private advices from Con. Virginia state that the mine is looking very well, and they are in position whenever the order comes to start important work which it is thought would change the complexion for the better. In Chollar they have a fairly good prospect. In Potosi and Bullion they are working to make connection with the old Crœsus shaft and the long west crossdrift that was run by Bullion. The showing in both Justice and Alta is said to be quite promising, but the trading public take little interest in them. In Occidental the showing is good, but it looks as if it will take some time before they are ready for more extensive exploiting. Standard ought to be in position to resume regular monthly dividends.

From the Comstock mines official letters are largely a rehashing of letters filed every week for many weeks past. The only difference in them is a kill-time change of work reported every few weeks; but the distances run by and material encountered in most of the mines have a monotonous sameness. In Utah they are still going in a northwesterly direction. The material passed through is unchanged. In Andes they are running a west crossdrift on the 175-foot level. In Sierra Nevada, owing to the dip of the ore, the upraise is out of ore. When connection is made above, then it is expected active exploiting will be resumed. There was raised the past week sixty-five tons of ore assaying, as per sample, $40 in gold and twenty-one ounces in silver to the ton. Fair progress is being made in the north lateral drift on the 900-foot level. No change in material is reported. They are making about 20 feet a week in the west crossdrift on the 900-foot level in Union. Nothing important is reported. In Mexican they are still going east on the 1000-foot level. In Ophir they are still crossdrifting to the west on the 1000-foot level and on the Central tunnel level. If they would use the drill the management would disabuse the public of the belief that they are trying to freeze them out. No new work, so far as the official letter goes, has been started in Con. Virginia. Active work is being done on and around the 1550-foot, 1650-foot and 1750-foot levels. No important results are looked for now before next winter, unless the share market works into better position, but this can be said about all of the mines. The joint work of Best & Belcher and Gould & Curry is the same as reported last week. In Savage no change is reported. They are running for the ore found in Chollar. In Chollar they are following the 4-foot ore found in the 100-foot level. They extract a few tons of ore each week. They are running a west crossdrift on the surface tunnel level to strike the downward continuation of the ore. Fair progress is being made in repairing the main incline. The joint work of Potosi and Bullion is confined to the south drift and repairing the old Crœsus shaft. In Alpha they are running a west crossdrift. They have extracted a few tons of low-grade ore. The work in Con. Imperial is confined to the long west drift. In the joint Challenge, Confidence and Con. Imperial west crossdrift a strong flow of water is still reported. This drift will drain a large area to the west and, if not stopped, will tap the west lode, which is gold-bearing and gives high assays. From Yellow Jacket no news is reported officially. It is said that the important work which was to be started is said to be delayed. The work in Crown Point, Belcher and Seg. Belcher is practically the same as reported last week. The work in Caledonia is reported on the 1100-foot level. From Justice no change is reported. The superintendent of Alta reports that they are extracting about four tons of ore a day, assaying about $38 to the ton. "The ore found in the east crosscut is 18 inches wide and getting wider to the north. It assays from $31 to $42 to the ton."

On the Brunswick lode interest begins to center largely on the proposed work by Gould & Curry on the Comstock tunnel. They intend taking up the drift run to the north in Savage where $40 ore was struck, extend it in their ground and explore that level thoroughly. Mining men are quite confident that quite a body of paying ore will be struck and and if so there will be renewed interest in the mines on that lode. Best & Belcher, Con. Virginia and Gould & Curry are still sinking the incline shaft and at the same time they are running a south drift on the 600-foot level. No change is reported from Savage. In Chollar the work is largely repairing throughout the mine. Main incline shaft No. 1 is being sunk about 16 feet a week. The general situation in Potosi is unchanged. No change is reported in the work outside of their having resumed work in the south drift on the 600-foot level. The showing in Occidental continues favorable, but it will take considerable time to develop the ore found. Work on the different levels is about the same as reported last week.

The following illustrates the changes of the week:

Working Capital for Mines.

PACIFIC EXPLORATION COMPANY

Will form companies and find capital to develop mines on shares or commission. Miners who have a good prospect should write the manager of this company for particulars. Address W. E. HOLBROOK, Manager, 29-30 Chronicle Building, S. F.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from John E. Burton, in the Green Mountain Mine near Mokelumne Hill, Calaveras Co., to deposit tailings in Chili Gulch; from the Harville Mining Co., in the Harville Mine near Placerville, El Dorado Co., to deposit tailings in Martinez Creek; from A. B. Jacks, in the Badger Hill Mine near Spanish Ranch, Plumas Co., to deposit tailings in Spanish Creek; and from the Star of Plumas Water and Mining Co., in the Star of Plumas Placer Mine near Buck's Ranch, Plumas Co., to deposit tailings in a ravine, gives notice that a meeting will be held at Room 59, Flood Building, San Francisco, Cal., on March 28, 1898, at 1:30 P. M.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from Wm. Nolden and C. Kaber, in the Aureole mine, near Oleta, Amador county, to deposit tailings in Deadman creek, and from George Beattie, in the Beattie mine, at Georgia Slide, El Dorado county, to deposit tailings behind the dam of the Gold Bug mine, in Canyon creek, gives notice that a meeting will be held at room 59, Flood building, on April 11, 1898, at 1:30 P. M.

Rainfall and Temperature.

The following data for the week ending 5 A. M., March 23, 1898, are from official sources, and are furnished by the U. S. Weather Bureau for the MINING AND SCIENTIFIC PRESS:

CALIFORNIA STATIONS.	Total Rainfall for the Week	Total Seasonal Rainfall to Date	Total Seasonal Rainfall Last Year to Same Date	Average Seasonal Rainfall to Date	Minimum Temperature for the Week	Maximum Temperature for the Week

Assessment Notices.

CHURCH GOLD MINING COMPANY.—LOCATION of principal place of business San Francisco California; location of works, El Dorado, California.

Notice is hereby given that, at a meeting of the Board of Directors, held on the 23d day of March, 1898 an assessment (No 1) of 3 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary at the office of the company, room 15, Nevada block, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 29th day of April, 1898, will be delinquent and advertised for sale at public auction, and, unless payment is made before, will be sold on MONDAY, the 23d day of May, 1898, to pay the delinquent assessment together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

A. P. SWAIN, Acting Secretary.

Office—Room 15, Nevada block, San Francisco, California.

CONSOLIDATED ST. GOTHARD GOLD MINING Company.—Location of principal place of business, 113 Crocker building, San Francisco, California; location of works, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 10th day of March, 1898, an assessment (No. 13) of 15 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 113 Crocker building, sixth floor, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 19th day of April, 1898, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 11th day of May, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. F. HOLLING, Secretary.

Office—113 Crocker building, sixth floor, San Francisco, California.

NORTH BLOOMFIELD GRAVEL MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, North Bloomfield, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Directors held on the 25th day of Feeruary, 1898, an assessment (No. 50) of 25 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 24, 320 Sansome street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 6th day of April, 1898, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on WEDNESDAY, the 27th day of April, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

H. PICHOIR, Secretary.

Office—Room 24, 320 Sansome street, San Francisco, California.

RICHMOND GOLD MINING COMPANY.—Location of principal place of business San Francisco, California; location of works, Butte County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 2nd day of March, 1898, an assessment (No. 2) of 1 cent per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, room 406, No. 328 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 9th day of April, 1898 will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 2nd day of May, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

L. R. TUTTLE, Secretary.

Office—Room 406, No. 328 Montgomery street, San Francisco, California.

ANDES SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia City, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 7th day of March, 1898, an assessment (No. 45) of 5 cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, room 22, Nevada block, 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 11th day of April, 1898, shall be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on THURSDAY, the 28th day of April, 1898, at 11 A. M., to pay the delinquent assessment, together with the cost of advertising and expenses of sale.

By order of the Board of Directors.

JOHN W. TWIGGS, Secretary.

Office—Room 22, Nevada block, San Francisco, California.

Tepezalá, S. de A. C. 12/17 1897

The Weber Gas Engine Co.
Kansas City Mo

Gentlemen:— In reply to yours of 6th inst to Mr. Geo. D. Barron. Your 10 H.P. gasoline hoist has been installed underground at this hacienda and is hoisting from a 190 ft. winze. The present dump on the hoist is 40 buckets of 65 each, per skip. When necessary this can be increased as the actual time consumed for round trip, together with the dumping of bucket is but three minutes. The consumption of gasoline is 3 gallons daily. The winze has a dip of 65° and hoisting is done by means of bucket on skids, thus creating considerable friction.

Yours very truly
Edward Dobrr Supt.

THE BROWNELL "PATENT LIP" FLANGE FRUE VANNER BELTS.

It has taken years of ceaseless testing and experimenting to produce the superior belt which we now offer, with elastic flanges and pliable body reinforced with specially woven duck. Every belt is manufactured by experienced workmen, and carefully tested on machines especially built for that purpose; consequently we are to-day manufacturing the best belts that mechanical ingenuity, combined with honesty of construction, can possibly produce.

ORIGINAL EMPIRE MILL & MINING COMPANY,
GRASS VALLEY, NEVADA CO., CAL., Feb. 20, 1897.

JAS. S. BROWNELL, ESQ., San Francisco, Cal.—DEAR SIR: The Brownell Patent Lip flange belt for ore concentrators, which I bought of you nearly two years ago, has been in constant use and is in good order and gives us perfect satisfaction. We have several other kinds of belts in the mill, and your belt and flange I consider the best of all. Yours respectfully, ROBT. WALKER, Superintendent.

ROANOKE MINING COMPANY,
MOKELUMNE HILL, March 4, 1897.

MR. JAS. S. BROWNELL, 132 Market St., San Francisco, Cal.—DEAR SIR: We have in our 20-stamp mill at this place five Frue vanners; three of these are equipped with the Patent Lip flange belt and two with the plain flange belt. We certainly consider the former a great improvement on the latter. They will certainly wear much longer, as cracking now seems out of the question. Any one purchasing the Frue vanning machine should see that it is equipped with the Patent Lip flange belt. Very truly yours, ROANOKE MINING COMPANY.
Per G. M. WILDE, Acting Superintendent.

No. 1969.—VOLUME LXXVI. Number 14. SAN FRANCISCO, SATURDAY, APRIL 2, 1898. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

The Utica Mine, California.

The following description of one of California's great gold mines is taken from the Mineral Resources of Calaveras County: The Utica mine, owned by the Hobart estate, is another example of an old abandoned mine made to pay well by systematic development and proper management.

Angels Camp was one of the earliest settlements in the county, but the present prosperous condition of the vicinity is entirely owing to the great work of this company, which in all its surroundings employs over 500 men. There are three claims controlled by the company—the Utica Stickles, upon which there have been erected 120 stamps; the Madison, upon which are forty stamps, and the Gold Cliff which has twenty stamps. A three-compartment shaft has been sunk upon the Stickles to a depth of 1360 feet. It is very difficult to obtain an exact statement of the yield from this mine, but when the plant was running in full blast, before the great fire of last summer, for many months the yield was as high as $200,000 per month.

THE UTICA MINE, CALAVERAS COUNTY, CAL.

Water is used for power and the supply is owned and controlled by the company, the ditch being completed from Alpine county, over sixty miles.

When the business justifies it, an enormous electric power can be generated from present water facilities.

The company operates a large chlorination plant for treating sulphurets, also a cyanide and electric plant.

In the town of Angels there is a remarkable complexity of veins. The main branch of the mother lode can be traced along the hill west and northwest of the town, though it diminishes in size. The serpentine rock of the Madison is replaced northwesterly by an altered diorite.

The shaft of the Utica and Stickles mine starts with vein at the surface, but at a depth of 500 feet the vein takes a somewhat flatter dip, but the shaft continues at the same angle in the foot to the 1360 level.

The stopes of this mineral zone are from 10 to 100 feet wide. The entire gold-bearing zone consists of a great mass of altered diabase, which has been rendered slatey and splintery by pressure, and subsequently altered to chloritic or talcose schist. Large masses of crushed diabase are replaced by solid, massive quartz. Power drills are used, and the average weekly progress in sinking the large shaft has been 35 feet. A great forest of round timbers are used up in the shaft and drifts. All the waste is used in filling up the old stopes, and the absence of the large waste dump is a noticeable and original feature of this mine.

The formation of the Madison is typical of the district, and of the other claims belonging to the Utica Company, and a description of the upper workings will show the general formation. The foot wall is black slate and hanging wall is diorite. One hundred and fifty feet away in the hanging wall there is a decomposed serpentine rock. The hanging wall vein which is more regular, is in some places 8 feet thick. No gouge separates it from the slates, which for some distance are intersected by small veins. The main vein averages 3 feet, with a thin gouge between it and the hanging wall vein. No well-defined foot wall has been reached. The quartz is bunched and quite flat at times. The average dip is 43 degrees northeast. The massive portion of the quartz contains very few sulphurets, the heavy mineralization being on the foot wall side. The free gold is mostly in the hanging wall vein. The slates on either side of the quartz are impregnated with sulphurets, and are worked for some distance in. These thin bands of quartz, alternating with leaf-like talcose strata, form the body of the ribbon-like rock on either side of the main quartz deposits of this claim, and also of the Gold Cliff mine on the north. Its course is about the same as the Madison. The dip is from 60 to 70 degrees northeast. It varies in width from 1 to 4 feet, and is grooved and polished on its upper surface. A small vein having a slight gouge, and a remarkably smooth foot wall, joins this on the foot wall side. The rock milled is the small vein, and the slates and ribbon-like quartz between it and the main ledge, which is not worked. East of it is a small pocket vein. This has no defined hanging wall, and the slates are mineralized and intersected with quartz stringers for some distance.

A VIRGINIA CITY, NEV., miner questions "Is there any more powerful hoisting machinery anywhere than on the Comstock?" In several places, notably Butte, Montana, where two hoisting engines, furnished by the Union Iron Works, have four cylinders, two initial 26″ diameter and two low-pressure 46″ diameter by 72″ stroke. One of these hoisting engines is placed on the Never Sweat shaft of the Anaconda mine, Butte, Mont. This hoist raises ten tons of ore at a load in a skip at the rate of 2500 feet per minute. They use a flat, steel rope 8″ wide by ½″ thick; weight of skip without load is 4800 pounds. In the Red Jacket shaft of the Calumet & Hecla runs a four-deck cage on which is lifted six tons of ore at a rate of 3000 feet per minute. This shaft is now 5000 feet in depth. The largest hoist on the Comstock is on the Union shaft, two cylinders each 28″ diameter by 96″ stroke. Probably the most powerful hoisting machinery on any vertical shaft in California is on the Oneida mine, Amador county, now being sunk to tap the vein at 1750 feet. This hoist is capable of supplying an 80-stamp mill with ore from a depth of 2500 feet.

A SHASTA COUNTY inquirer asks if tellurium has ever been discovered in California and how to determine its presence. Telluride ores occur in northern Tuolumne, southern Calaveras and other sections of the State. Some time ago was published herein the following: Any miner or prospector who has a blow pipe, alcohol lamp and a few drops of cold sulphuric acid can, in a few minutes, determine whether tellurium is present in ores. All that is necessary is to break off a small piece of the ore, place it in a small porcelain dish previously warmed so as to avoid breaking, apply the blow pipe until the ore is at an oxidizing heat, then one or two drops of sulphuric acid on porcelain dish; allow to mix with the ore. The reaction will immediately follow, if tellurium is present, by beautiful carmine and purple colors.

MINING AND SCIENTIFIC PRESS.

ESTABLISHED 1860.

Oldest Mining Journal on the American Continent.

Office, No. 330 Market Street, San Francisco, Cal.
Telephone Number, Davis 771

ANNUAL SUBSCRIPTION:

United States, Mexico and Canada.....$3 00
All Other Countries in the Postal Union.....4 00

Entered at the S. F. Postoffice as second-class mail matter.

J. F. HALLORAN.....General Manager

San Francisco, April 2, 1898.

TWO INTERESTING FACTS.

In all the States of the Far West and the Pacific Slope, consisting of California, Oregon, Washington, Idaho, Montana, Wyoming, Colorado, New Mexico, Arizona, and Utah, the largest circulation credited to any publication devoted to engineering and mining is accorded to the MINING AND SCIENTIFIC PRESS, a weekly, published at San Francisco, Cal.—*American Newspaper Directory.*

Among the engineering and mining papers in California, none has credit for so large a regular issue as is accorded to the MINING AND SCIENTIFIC PRESS, published weekly at San Francisco. In fact, it fully equals five times the combined issue accorded to all the others.—*American Newspaper Directory.*

TABLE OF CONTENTS.

ILLUSTRATIONS.—The Utica Mine, Calaveras County, Cal., 365. Electro-Chemical Treatment of Ores, 368. Thirty-six Inch Twin Impulse Wheel, 372.
EDITORIAL.—The Utica Mine, Cal., 365. Some Further Answers; The U. S. Patent Office, 365-67. Miscellaneous, 365-66-67.
MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 373-74-75.
THE MARKETS.—Eastern and Local Markets; Mining Share Market; Sales in San Francisco Stock Board; Notices of Assessments, etc., 386.
MISCELLANEOUS.—Electro-Chemical Treatment of Ores; The Engineer in Modern Warfare, 368. Concerning Certain Physical Theories, 369. The Witwatersrand Banket, with Notes on Other Gold-Bearing Pudding Stones; Gold Deposits, Geology and Geography of Alaska, 370. Coast Industrial Notes; Personal; Recently Declared Mining Dividends; Recent California Mining Incorporations; Commercial Paragraphs; Books Received; List of U. S. Patents for Pacific Coast Inventors; Notices of Recent Patents, 371. Cost Accounts; An Interesting Power Plant; Oil in Steam Boilers; Loading of a Ship, 372.

THREE men from Dawson report that twenty tons of gold will be brought from the Yukon this season. They also state that a $9000 nugget has been found. The Boise, Idaho, *Statesman* incredulously thinks that it should be stated what the boomers paid those men to come out from the Klondike at this season to bring this news.

CALIFORNIA Congressmen are confident of the passage at this session of Congress of the original Mineral Lands bill, which has been pending before that body for several years, provided no amendment be attached to it in extending its operations to Oregon. A U. S. Senator from Nevada and a U. S. Senator from Oregon were able to block this measure twice, but it is believed that there is some probability of success this session.

IN a long communication in *Science*, March 18th, '98, S. H. Emmens of New York declares that he is in receipt of a letter from an eminent physicist informing him that after following his (Emmen's) suggestions regarding the transmutation of silver into gold, he had "performed the crucial experiment," and that "the gold contained in a Mexican dollar, after forty hours of intense cold and continued hammering, was found to be 20.9 per cent more than the quantity of gold contained in the same dollar before the test." It is a matter of regret that the eminent physicist did not disclose how much gold was in the Mexican dollar before the forty hours of intense cold and continued hammering.

UNDER date of March 31st, Prof. Perrine furnishes the following from Lick Observatory, on Mt. Hamilton, Cal.: "The heaviest shock of earthquake ever felt on Mt. Hamilton occurred last night at 11:43:20 o'clock. The seismograph shows the vibrations lasted forty seconds, and the approximate motion of the earth was a quarter of an inch. This is an unusually heavy quake, the motion being usually only a few hundredths of an inch. There was no continuous quake of varying intensity. During the first fifteen seconds the vibration was light. After that came the hardest part of the shock, which gradually lessened. The greatest motion was from northeast to southwest."

AT a meeting of the executive committee of the California State Miners' Association on the 28th ult. it was the sense of the meeting regarding the secretaryship of mines and mining that present success in that direction could best be secured by an effort to have created a Commissioner of Mines as a subordinate part of the Department of the Interior. It was decided that due recognition of the importance of the International Miners' Convention (which is to be held at Salt Lake City, Utah, July 6th, 1898) required adequate representation by California miners, and that the Secretary of the California State Miners' Association communicate with the officers of the several county organizations, urging the appointment of representative delegates who would attend.

THE Government administration of the Swedish State railway invites engineers to a competition of designs for the arrangement of new railroad stations, junctions, etc., for the city of Stockholm. The first prize is 12,000 Swedish crowns (about $3230), the second 8000 Swedish crowns (about $2150), the third about 4000 Swedish crowns (about $1075). The time for competition will expire at noon on Aug. 31, 1898. Particulars will be furnished by the Swedish-Norwegian Legation, 2011 Q street, Washington, D. C., or by the Vice Consul of Sweden and Norway, A. Peterson, LeDroit building, corner F and Eighth streets, Washington, D. C. Security to the amount of $13.50 for the use of the drawings in this competition will be required, which will be refunded when the drawings are returned. The Swedish representative, in making this announcement, expresses the hope that American engineers will carry off some of the above prizes.

Two mining cases last month strikingly illustrate the necessity for change in our mining laws, so that well meaning and intelligent judges can render at least approximately correct decisions. The one was the mining suit of E. R. Morse against the Montana Ore Purchasing Co., which was tried in the United States Court. Judge Knowles, who patiently gave attention to the case, plainly stated his inability to feel satisfied with his own decision. The fact that about twenty mining experts testified to contradictory statements, probably increased the judge's perplexity. Denuded of verbiage, the point was: "Are detached ore bodies and connected stringers to be regarded as part of the vein and entitled to all the extralateral rights with the dip of the vein itself?" In this case the apex of the zone was divided in an extensive way—part in the ground of the defendant, part in that of the plaintiff. The verdict (which was a costly one to all concerned) was in favor of the plaintiff, who had sued for damages in the sum of $150,000, the alleged value of five-sixths of the ore taken from certain stopes on the Windlass vein. The defendant admitted in the course of the trial to having taken 18,039 tons of ore, to the value of $46,144. The question of the amount of damages was submitted to the jury, upon which amount it was unable to decide. The other case was in Colorado, on the application of the Portland Gold Mining Co. of Cripple Creek to restrain the Uinta Tunnel Co. from extending its tunnel through the Lowell claim, one of the properties of the Portland Mining Co. The claim was located in '91, the tunnel site in '92. The tunnel is now in 2300 feet to where it strikes the Lowell. Upon reaching the Lowell, the Portland Co. secured an injunction. The contention was over the right of the Uinta people to extend their tunnel through the Lowell claim. The Portland Co. set up that, under the ruling in the Royal Sovereign case, lately decided by the same judge trying this case, a tunnel cannot be extended through a mining claim of earlier location; another point being that a tunnel site, which starts on unappropriated public domain, with one or more valid claims in its path, cannot cross them. The judge, at present writing, has the case under advisement, new points having been brought up that tend to discredit his former decision. It looks as though the tunnel people would be defeated. In both cases the judges are men of unusual experience and ability, of reputations beyond reproach, and yet they are unable to satisfy themselves, much less administer equal and exact justice. The two cases cited are the latest exemplifications of the much needed simplifying of our present Federal mining law. What is deemed by many as needed in the former case is the abolition of all "extralateral" rights; in the latter an amendment showing what tunnel projectors may justly claim.

Some Further Answers.

A Yuba county, Cal., man wants the "straight" of the present muddle about river improvement and appropriations. This whole thing has been explained at length in previous issues, and what can now be said good of it is not new, and what can be said new of it is not good. Some of those whose interest it is to delay, and whose official position would be cut short by proper expenditure of the money, have succeeded in tying everything up, so that little is being done except talk and refer numerous speculations and hypotheses to State and Federal Attorney-Generals and privates, who furnish opinions that are sufficiently obscure to justify further delay. The most recent suggestion has been that in the case of the $250,000 appropriated by California for the construction of restraining barriers, Congress having voted a similar sum for the same purpose, the Secretary of War be empowered to make contracts whereby it is "agreed that the United States shall pay one-half or other proportion of the amounts stipulated, and the contractor shall look solely to the State of California for the other half or other proportion of the same under the said State acts," the Secretary of War, as in the other instance, being authorized to receive payments from this State as the work proceeds.

With this view the Sundry Civil Appropriation bill (which was reported favorably to the Senate on the 30th ult., and which will undoubtedly go through) contains an appropriation of $250,000 "to carry out the act of 1896 for the erection of restraining barriers under direction of the War Department, and in accordance with the recommendations of the California Debris Commission, provided that California furnishes to the United States Treasury any amount already appropriated or to be hereafter appropriated by the California Legislature. The Secretary of War is authorized to enter into an agreement that the contractor shall look solely to the State of California for one-half of such expenditure to be paid out of said State appropriation, and the United States shall in no manner be liable for said one-half."

As to the construction of restraining barriers, for which both State and National appropriations have been made, it is a matter of regret that greater progress has not been made in the matter. It was long ago supposed that every possible obstacle to the expenditure of the appropriations made respectively by the State and National governments had been overcome, and that nothing remained to be done but to proceed with the work. The appropriation by the Federal Government of $250,000 in June, 1896, was absolute and without condition and is so held by the Controller of the Treasury in his letter to the Secretary of War dated October 2, 1896. In answer to the specific question as to whether or not the appropriation was absolute and without condition the Controller, among other things, says:

"I do not think that a compliance with the terms of the proviso that the Treasurer of the United States is authorized to receive a State appropriation can be construed to be a condition precedent to the use of this appropriation for its intended purpose. This proviso does not read '*provided* the Treasurer of the United States *shall* receive from the State of California any and all sums of money appropriated by the State,' but it is that 'he is *authorized* to receive such appropriation.' In my opinion, if no appropriation were made by the State this $250,000 would (other conditions being complied with) still be available."

Neither is there any difficulty about the expenditure of the Federal appropriation. The Attorney-General of the United States in a letter to the Secretary of War dated September 15, 1896, lays down clearly the course to be pursued by the California Debris Commission in the expenditure of this money. The Attorney-General states that any contract let for the construction of restraining barriers should contain express provisions that the contractor should look for one-half of his pay to the State authorities. Among other things, the Attorney-General says:

"If the California State authorities satisfy the contractor that they may be relied upon to assume one-half of the expense, and if they are willing to go into such a contract as seems to be contemplated by

the California Debris Commission, the Commission are at liberty to consult with the United States Attorney for the Northern District of California with relation to the details."

The two letters quoted above were before the legislative committees at Sacramento during the last session of the Legislature, when the language of the State appropriation was so changed as to meet the requirements suggested in the letters last referred to. It seems that all has been done that is necessary to be done by both Congress and our State Legislature to enable the sum of $500,000 to be expended in the construction of restraining barriers for the purposes set forth in the language of the respective appropriations. The latest mentioned appropriation permits contracts for $500,000 to be entered into by the War Department, though, so far as the debris dams are concerned, it is understood that nothing can be done until there is a report of the Commission, which is expected shortly.

This is a matter in which valley and foothill residents are alike interested. It is a matter of sincere regret that so much effort (that was thought at one time to be successful) has been thwarted in its just result by State officials.

From Colfax, Cal., is asked the difference between "tunnels," "adits" and "drifts." Without assuming to be technically exact, it may be said that the term "tunnel," under the strictest construction, can correctly be applied only to a horizontal passage, slightly inclined, if any, through a hill and open at both ends. The general understanding, however, is about the same as that of an "adit" or "drift"—that is, a nearly horizontal passage from the surface through which a mining claim may be entered, worked or unwatered. As to the remainder of the inquiry as to what constitutes a drift or running a tunnel, since the absurd decision of the Supreme Court of this State in the case of Jorgensen vs. Diller, it is difficult to determine what the judicial interpretation of any of these terms may be. In that case the Supreme Court of California saw fit to solemnly announce that drifting in a tunnel meant taking earth, gravel or ore from ground made accessible because of the tunnel; but that it was not synonymous with running a tunnel. According to that decision, there is a difference between a miner working on a crosscut tunnel until it reaches the ledge, and working upon a tunnel which follows the vein. It will be noticed that this paper uses the word "tunnel" in what is believed to be its ordinary common-sense meaning. So far as ordinary mining usage is concerned we fail to note much, if any, practical difference between the terms "adit," "drift" and "tunnel." Probably if there were any, it would be constituted in the possibly larger size of the subterranean passage designated as a "tunnel."

From southern California, more especially around Randsburg, come several inquiries as to assessment work and recent Federal rulings, that can in general be answered by the long article on this subject in the issue of the 19th ult., which explained the situation and the recent ruling of the Secretary of the Interior regarding the patenting of mining claims, which allows mine owners to July 1st, '98, to secure mineral patent on a group of claims on proof of a total expenditure of $500 for the entire group. It is to be borne in mind that this ruling is merely an extension of the time from January 1st, '98, to July 1st, '98; and after July 1st, '98, the ruling of December 15th, '97, which set aside all former rulings on this subject, comes into effect; that is, on all applications for mineral patent made and passed to entry before July 1st, '98, proof of an expenditure of $500 upon a group of mining locations will be admissable and allowed; but after the 1st of July, '98, all applicants for patents must show an expenditure of $500 upon each claim, in compliance with the famous Ruling 53 of the General Land Office which was issued December 15th, '97.

Regarding the questions asked as to it by two of the inquirers who thoroughly understand the foregoing, it may be said, that owners of groups of claims, by quick work, could rush their applications and secure patents before July 1st, '98; but it would have to be very quickly done. This is April 2nd; it takes sixty days to advertise the application through the Surveyor-General's office; yet by close connection right through, an applicant can take advantage of the extension of time, as there is still practically ninety days in which to make application, begin advertising it, and get the application for patent passed to entry before July 1st, '98. But it must be borne in mind that after July 1st, '98, in any event, not less than $500 worth of work must be satisfactorily shown to have been done upon each claim, whether grouped or not, for which an application for patent is made.

Another inquirer on this subject of assessment work is informed that annual assessment work on an unpatented mining claim is virtually done to keep the claim from lapsing. There is no point in attempting to keep the "title" up. Had the inquirer, for instance, located a mining claim five years ago, and never done anything after that in the way of active work, while the claim would be jumpable at any time, yet he could get in now, were the claim not relocated, and by doing $500 worth of improvement work, get a patent immediately. The question is simply, in a case of this kind, if the locator thinks the claim is worth jumping or not. If he thinks it is not likely to be relocated, he can defer putting any work on it and take his chances; if he thinks it is, the sure way to keep his title alive is to see that $100 worth of work is annually put on it.

Returning to Ruling 53: It is believed by many practical miners that putting it in force will ultimately inure to the general benefit of the mining industry everywhere. Discussing this subject, one authority says:

The ruling allowing an applicant to obtain a patent for a group of claims with an expenditure of no more than $500 upon the whole was all wrong. It worked an injury upon the capitalist, upon the prospector, and upon the community. Under it men were enabled to take up the entire side of a mountain, and if they could make the Surveyor-General believe that a few shallow workings, for which $500 had been expended, would develop the whole, they could get a patent. In this way valuable tracts of mineral land could be held from the prospector, the introduction of capital for the development of the ground would be prevented, and the community would be deprived of the results that would follow development. The law contemplates the expenditure of $500 upon each claim and when the Land Office construed the law so as to permit the patenting of an entire group with no greater expenditure it was a gross injustice to the entire mining industry. The ruling of Commissioner Hermann restoring the old practice of the department in accordance with the law was right and should have been allowed to stand without any extension of time. Because the law had been disregarded once is no reason for the continuance of illegal methods.

Where a miner owning part of a claim wants to get it patented against the wishes of the other part owner or owners he can apply for and have patent issue in the name of himself and other owners. The government will not issue a patent for a divided or undivided interest in a claim. The cost is the same whether jointly or individually owned, and the usual government fees must be paid. Just how that last question can be settled is entirely between the disagreeing partners or owners. But no dissenting part owner can prevent the other or others getting a patent and using his name in the application therefor.

The clipping taken from the Denver *Mining Record*, sent by a Georgetown, Colorado, subscriber, regarding tracing platinum to its original rock source, and accompanying questions, requires more space for extended answer than is at present at our disposal.

Platinum is usually widely found minutely disseminated in serpentine rocks or their debris. Only in the Ural mountains in Russia does it occur in grains, and so far as known, it is only in that region that platinum is largely mined in commercial quantity.

Some time ago a mining and scientific research on the Similmakeen river, B. C., resulted in the discovery of platinum as usual in placer ground, but under circumstances that gave color to the assumption that a belt of diorite cut by the river at that point was that metal's matrix, and would there be found —a theory that considerable subsequent work did not tend to establish.

So far as the writer is able to learn, platinum is not found anywhere except as a placer deposit. On the Demidoff estate and in the Goro-Blagotat district, Russia, unlike anywhere else, platinum is mined for itself alone. It is there found in a 10-inch streak of sand, resting upon a serpentine bedrock from 10 to 40 feet below the surface. A shaft is sunk to bedrock, a drift run, the sand hoisted and fed with water from a stream or sluice. Several thousand men and women are employed there—the former earning about 60 cents a day, the latter about 35 cents. It costs $16.75 per kilo to wash this Ural platinum sand, which would be about 40 cents per metric ton. Sand containing less than three grammes of platinum per ton is not considered profitable; it averages about four grammes per metric ton, on which there is a Government tax of 3 per cent.

A little platinum is yearly produced in this State, mostly found in connection with iridosmine in northern and central California, about 500 crude ounces Troy per year being thus produced, and worth in this State about $6.50 per ounce.

A Lillooet, B. C., correspondent asks at what rate per ton gold is absorbed by new copper plates. We hesitate to state with definiteness. This has been for many years the subject of inquiry and experiment, and so far as known nothing positive can be said. The most recent experiments that have come to the notice of the writer on this subject were made last February at the Simmer and Jack, Johannesburg, South Africa, the experiments going to show that first gold was absorbed there at the rate of about half an ounce to the ton of ore milled. Just how long such absorption continues is also an unsettled question. It is generally accepted that the primary absorption is the greatest; but the process of absorption is a continuous one.

The same correspondent wants "a quick way" of freeing copper plates from gold. One good way would be to put them over a charcoal, coal or coke fire and slowly evaporate the quicksilver off them. Where admissible, the fireplace of a spare boiler can be utilized, using a thin red fire. After the entire evaporation of the quicksilver the plates should be slowly cooled, rubbed with muriatic acid and put in a damp place over night, then rubbed with a solution of sal. ammoniac and saltpeter, and again heated slowly over a red fire. They must not be allowed to get red hot; when the proper degree of heat is reached the gold scale will rise in blisters, when the plates should be taken from the fire and the gold scraped off. Any part of the plate on which the gold has not blistered should be rerubbed with the solution and again fired. The gold scales should be collected in an earthen dish and covered with nitric acid, till all the copper is dissolved, when the gold can be smelted in the usual way; but after it is melted corrosive sublimate should be put in the crucible till a blue flame ceases to be given off.

The U. S. Patent Office.

The report of the Commissioner of Patents for the year 1897 shows that during last year there were received 45,661 applications for patents, of which the patents granted amounted in number to 23,729, including designs; sixty-five patents were reissued, and sixteen prints. The number of patents that expired was 12,826. The total expenditures were, $1,122,843, the receipts over expenditures, $252,798. The total balance to the credit of the Patent Office in the Treasury of the United States on January 1st, 1898, was $4,971,438.

Mr. Greeley has this to say regarding practice before the Patent Office:

"Under the over-liberal rule of practice by which any person of intelligence and good moral character may appear as the agent or attorney in fact of an applicant, not a few such attorneys have in the past been permitted to practice before the office, with the result that, on applications badly prepared and unskillfully and carelessly prosecuted, patents were issued which, while valid for all they claimed, were worthless in that they failed to adequately protect inventions which, properly claimed, might have been worth thousands of dollars.

"An earnest attempt was made during the year to correct abuses which have arisen in consequence of this liberality of practice, and several attorneys whose operations savored of confidence games, by which the unwary and unlearned lose their money, were disbarred."

Applicants for patents cannot be too careful in choosing their patent attorneys, for upon the ability and rectitude of the patent lawyer depends largely the satisfactory securing of the requisite patent. In this regard it is worthy of notice that the books of the MINING AND SCIENTIFIC PRESS Patent Agency, of which Geo. H. Strong is manager, show that during '97, of the applications for patents made through that firm over 90 per cent were granted, while reference to the totals quoted show that of the aggregate of applications less than 52 per cent was granted.

Electro-Chemical Treatment of Ores.

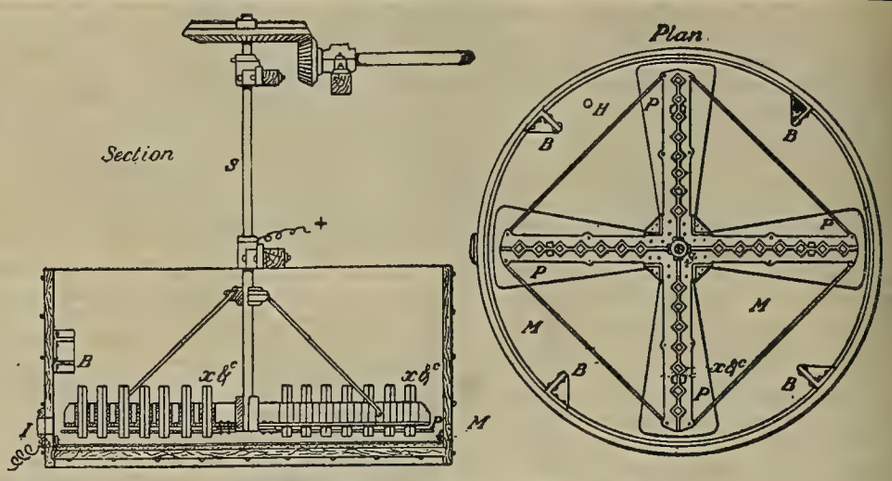
In some notes on the electro-chemical treatment of ores by C. E. Webber, an illustration is given of one of the simplest forms—namely, the circular vat, with the shaft of the anode in a vertical position. (See illustration and foot-note accompanying it).

In this, the space between the revolving anode and cathode is free from all obstructions, the disadvantages of which are that they tend to cause the ore under treatment to accumulate upon the cathode, and prevent perfect parallelism between the surface of the mercury cathode and the effective under-surface of the anode. The sludge is constantly and gently swept by the current from over the cathode, so as to have no tendency to settle on it, and also so that that portion of the sludge which is above the anode should not acquire such a continuous rotary motion as to cause the heavier particles to be carried outwards by the centrifugal action, and thus to travel round in the same plane, instead of in their turn being subject to the combined action of the electric current and the chemical agents employed.

This draws attention to the necessity that efficient agitation should, in the first place, maintain the sludge perfectly homogeneous throughout its mass, and, in the second place, should not be such as to disturb or break up the mercury cathode. In the example cited this is secured by regulating the speed at which the anode is driven, according to the size of the vat and the number and length of arms that are attached to the shaft, either for the support of the anode plates, or to act only as stirrers. For instance, subject to the density of the sludge, it is found that, if the speed of the agitator has to be lowered 30 per cent, the number of arms should be doubled.

As the diameter of a vat is increased, in order to maintain homogeneity in the mixture, the rate of motion at the periphery of the agitator would have to be increased, but to the detriment of the surface of the mercury cathode, namely, above a rate of about 8 to 10 feet a second. To avoid this the number of arms is increased. Provision is also made, to meet special circumstances, to add arms which vary in length, which may form part of the anode or not.

The proportion of water to ore in the sludge is a condition that also affects this department of the treatment, and it is found that between equal weights and proportions the best results are obtained when the water weighs three-fifths of the ore.



As regards the current, the potential should be capable of being governed between five and fourteen volts, and this must be done by resistance fixed in the circuit of each vat or group of vats. For instance, when using vats of 9 feet interior diameter, each capable of treating two and a half tons of ore, in two shifts—total, five tons—in a day of twenty-four hours, should a plant to treat 200 tons of ore a day be worked, forty vats will be required, and these would probably be governed in eight groups of five vats in a group. The quantity is regulated by the resistance in that part of the external circuit which lies between the electrodes. Provision is made for a minimum quality of one and a half ampere per square foot, being half the sum of the cathode and anode together in square feet; thus, if that area is equal to 52 square feet, the current should not be less, and not much more, than thirty-nine amperes.

During the whole time of treatment, "agitation," as distinguished from "percolation" or "circulation," is going on. The stages may be with or without the accompaniment of an electric current during portions of the time, but in any case the current is used during more or less of the time.

The liquid may contain sodium chloride (Na Cl) or potassium cyanide (K C N) alone, or both; but, as the sodium chloride is directly and in the first instance used to "reduce the resistance" or "increase the conductivity" of the solution, there is no stage during which—except for the purpose of mixing—it is used alone, without being accompanied by the current.

The expressions "reduction of resistance" and "increase of conductivity" are useful because they are easily understood; but they are not correct as applied to the solvent, i. e., water. These descriptions of the effect of the mixture of sodium chloride in a solution, and then placing that solution between an anode and a cathode, is scientifically inaccurate. What happens to the sodium chloride in solution in the water is that it is disintegrated and re-formed, and thus it becomes the intermediary by which, at the instant that chlorine gas and sodium are set free, the current is enabled to "commuicate" between the electrodes.

During the time of electrolysis, when the liquid contains only sodium chloride (Na Cl), the primary decomposition will be sodium (Na) and chlorine (Cl). In practice the quantity by weight of Na Cl may be between 0.2 and 1 per cent of the weight of the ore in the sludge, but this depends upon the nature of the gangue. In any case, the presence and addition as required of sodium chloride is a regulator of the electrical resistance of the solution which at any given moment is situated between the cathode and the anode, and, as the resistance in the conductors

ELECTRO-CHEMICAL TREATMENT OF ORES.*

counts for very little, it practically affords means of governing the current in the external circuit of the electrical generator or dynamo. Of the several compounds which might be used for the same purpose, common salt is doubtless much the cheapest.

As the sodium is liberated, in contact with the mercury cathode, a small proportion will no doubt be dissolved in the mercury as an amalgam. If the current ceases, this is converted into sodium hydate (Na HO), with liberation of hydrogen.

But the greater part of the sodium liberated will react at once with the water in the solution, giving Na H O and H, the former to be used as described further on. Most of the chlorine liberated will at first be dissolved in the solution, but, as the liberation will take place at the surface of the anode, a small quantity will be used up in attacking the metal of which the anode is made.

While this is going on, the liquid immediately in contact with the cathode will become rich in sodium hydrate (Na H O), and the agitation will cause it to come in contact with the chlorine liberated at the anode, with some of it to re-form sodium chloride (Na Cl), and with another portion sodium hypochlorite (Na Cl O) and water (H_2O).

This formation of hpochlorite in solution will, subject to the adverse conditions caused by agitation, be directly in proportion to the quantity of Na Cl used to regulate the resistance, and with the relations of the areas of the anode and cathode respectively.

But this formation of sodium hypochlorite will be limited to the extent to which the sodium hydrate above referred to, when it is liberated at the cathode, rises to lay hold of the chlorine which is rich around the anode. This we may regard as taking place in spite of the agitation of the stirrers, which probably tends to cause temporarily a rapid diffusion of the chlorine and sodium hydrate separately in the solution, although eventually they must come together.

Although, when not in excess, it is a useful oxidizer, this formation of sodium hypochlorite has little advantage; and when potassium cyanide is added to the solution, it is, when in excess, even when alkaline, likely to oxidize some of it into potassium cyanade—a decided disadvantage, as it is a salt which is easily decomposed, and much less useful.

Considering what may be effected by the chlorine liberated, but not engaged, as above described, one might expect the nascent chlorine to attack some of the baser metallic ores present in a finely divided state. For instance, sulphides, selenides, arsenides, etc., often attached to particles of gold or silver, would be so attacked, the chlorine uniting with metallic base iron or copper, and the sulphur selenium, or arsenic, being oxidized by the combined action of the chlorine and sodium hypochlorite above alluded to, into sulphuric, selenic or arsenic acids.

These changes would be marked by the formation of sodium sulphate, sodium selenate, etc., and the consequent formation of free acids, including hydrochloric acid.

This probably represents what actually is the cause of disintegration of some of the metallic compounds which are present in refractory ores, as the chlorine attacks these first in preference to the gold. At the same time, it is no doubt the case that, as the process continues, some of the gold is brought into solution by the chlorine diffused through it, as chloride of gold ($AuCl_3$), which is readily deposited by electrolysis on the mercury.

We all know that the solution of gold by chlorine is in common use, but I think that in the example given it is effected under novel conditions, the chlorine being added electrolytically instead of mechanically.

During the first two or three hours of treatment by agitation with the electric current, there is no doubt that the free gold which is not dissolved will be precipitated, the heavy particles at a very early stage of the process.

In all such mixtures there is also more or less of float gold, which in the processes using percolation, and even circulation, is lost in the slimes. These particles, if they escape solution, will be so well mixed up in and diffused through the solution by agitation that they should all in their turn be brought into close neighborhood of the mercury surface of the cathode.

The advantage of mechanically adding small quantities of sodium to mercury employed in gold extraction to assist amalgamation has long been recognized, but in this case the sodium so used is provided electrolytically. There is little doubt that the heavier particles of gold and silver which reach the bottom by subsidence will, owing to the surface being strongly polarized both by the current and by the slight amount of sodium amalgam formed by the current, be more readily amalgamated, and the same conditions also will promote the seizure by the mercury of the minute particles of float gold and silver when they approach the surface. The reason for this is probably, not merely that it is thereby kept clean, i. e., free from oxide, but that the difference of electrical potential set up between the mercury and the liquid alters the surface tension at the liquid junction, and helps the metallic particles to come in actual contact with the mercury. This is, I believe, a new way of defining what occurs when what is called "prevention of flouring" and the establishment of metallic contact with the mercury takes place.

* The revolving anode is mounted so as to be suspended from above in the vat at the lower end of a vertical shaft, S, braced and supported in the manner shown in the drawings.

The lower surfaces of the iron plates, P P, etc., attached to the under sides of the lowest tier of projecting arms, are in the same horizontal plane, and are carried at a distance of between 4 and 6 in. from the mercury cathode, M, which is a matter of regulation according to conditions which are well understood.

The positive connection from the dynamo is by way of the vertical shaft and a rubbing contact connected with the conductor.

The connecting cable from the negative pole of the dynamo is led to the copper plate of the cathode, M, with which it may make connection at one or more points.

In the space between the anode and the cathode the actions and reactions described further on take place, and the metal which is absorbed or taken up by the amalgam is there allowed to collect through the continuance of the treatment of successive charges until, when it is saturated, a clean-up takes place. According to the richness of the ore, a clean-up may be necessary at intervals of, say, two to fifteen days.

In order that the agitation of the sludge may be such as to prevent the accumulation of heavy material on the surface of the mercury, the revolving arms are provided with pins, x x x, vertically, and projecting downwards to within a short distance, say, an inch, of the cathode. These pins, as shown on the drawing, also project upwards, so as to help to maintain agitation throughout the liquid mass.

In order to correct the tendency to continued centrifugal movement of the liquid, projections, or baffiers, B, B, etc., are fixed at intervals to the inner side of the vat above the arms, either vertically or at an angle to the vertical. By their influence the revolving current is broken up, and guide inwards and downwards, so as to oblige every portion to pass in rapid succession through the space below the anode.

The pipe opening at the side of the vat and a little above the bottom, I, is for drawing off a charge at the expiration of its treatment; and the hole, H, in the bottom is provided for the purpose of drawing off the mercury at the time of periodical clean-up.

The Engineer in Modern Warfare.

The present agitation in connection with a possible outbreak of war brings to the public mind most forcibly the remarkable extent to which engineering has entered into all the details of modern warfare. Whether war occurs or not, it cannot be but realized that it is to the work of the engineer more than to any other member of the community that the country must look for defense and offense, and that it is in the machine shops and shipyards, in the drafting rooms and mechanical laboratories, that the destinies of modern nations are to be decided.

One has only to look back a few hundred years in history and note the absolute transformation wrought in warfare as soon as the introduction of gunpowder and fire artillery became an accomplished fact. The trained knight, bred to arms, and honestly believing that in him lay all the science of warfare that could ever be possible, was suddenly transformed into a ridiculous Don Quixote, helpless before the rude band of peasants, who, with their "villainous saltpeter" made all his knowledge of the art of war obsolete. To-day we are undoubtedly on the verge of a similar transformation, and should

he misfortune of war become a dire necessity, there s every reason to believe that the ingenuity of merican engineers, constructors, and inventors ould evolve devices of destruction before which the xisting battleships and fortifications would soon be elegated to obscurity. Two instances of most re- ent occurrence have demonstrated the weakness f modern warships; one the ease with which the ingle blow of a ram sent the Victoria to the bottom f the Mediterranean, the other the havoc which a ingle explosion wrought upon the Maine in Havana arbor. The modern warship is fatally like the rmored knight of mediæval times, vulnerable be- ause of exceeding bulk and clumsiness, a fair mark or the skill of the engineer who can combine force nd motion and substitute rapidity for massiveness, nd secrecy for strength.—The Engineer.

Concerning Certain Physical Theories.

NUMBER IV—CONCLUDED.

Evolution traces the descent of man and the higher nimals through older and simpler forms to a pri- neral germ by ordinary generation modified by en- ironment and natural selection. There has been ome variation under natural selection, but more nder artificial selection—the influence of man. This atter must be eliminated from any estimate of hanges in past eras. What is the meaning of the ouble sex which runs through all animate nature? lainly, it is the same reason that leads nature to eny fertility to cross-breeds and causes the prefer- nce for opposites, as when tall men choose short omen, etc. It is to average the species, to limit ariation. One sex would run into endless diversity. f variation be the great and good agency which has eveloped the higher animals, and improved on na- ure's original crude ideas, why does not nature give ree play to it? Why such care to bring back all ariations to the general average of each species? Natural selection is said to have "improved each reature in respect to its surroundings." Yet it is emarked that "in no country are the natives per- ectly adapted to their conditions, for foreigners ave taken possession in every country." Hence it ollows that animals are best adapted to conditions ifferent from those that moulded them, and to hich, by the theory, they should be best adapted, hus the exact reverse of the Darwinian theory. In- tead of the increasing variations called for by that heory, we see now and in past ages a careful pres- rvation of each species at its average, not at its est, and after a time a new and better species a tep forward. What is called a demonstration of volution is only a showing that these steps were horter than previously supposed and the series ore nearly complete, besides two other facts, that n all animals are vestiges, often useless, looking ack to older and simpler structures, and that em- ryos pass through stages resembling those older orms. All these four facts may be capable of an in- erpretation different from that given to them by volutionists.

If life be carried back to a single primordial germ, special creation only can account for that germ. But that accounting is far more difficult than that or all subsequent life, or for 10,000 subsequent spe- ial creations. Which would a builder sooner under- ake, to erect a palace of marble and iron and vari- us woods, with windows and carpets and stoves and urious bric-a-brac, or to contrive an acorn that would grow into all these? The mystery of the egg s greater than the mystery of the mammoth. For hese and other reasons, Darwinism fails to shed any ight on the origin of life or the methods of creation.

Two facts, the series in past and present from east to greatest in animal form and the unity of lan through all, are plain. If species really, as a natter of fact, arose by natural selection, environ- ment, amount of food, etc., they are of two things: either all these variations that include anything new were successful or that some were failures. There are no failures in nature, and no instance of even a partial failure. In all animal remains we find noth- ng crude or experimental, but only ideas thoroughly, perfectly and successfully worked out. The organs and parts of every creature have perfectly fulfilled their function. In proof, every species has existed for ages. If survival of the fittest be true, and the process has continued for millions of years, the mod- ern forms ought to be so immensely superior in the art of getting a living that the older would have no chance at all in competition. Yet some of the very low forms have persisted from remote geologic eras and are to-day thriving and successful, as the am- phioxus, the round-mouths, the garpike, the ephem- erids, and others. If all variations showing new parts were successful, how did it happen that an animal or a succession of animals could originate an organ or a part different from and superior to its own, serving often a different purpose without ex- perimentation or failure. Such would be possible only to antecedent knowledge and constructive skill, and only to an intelligence capable of holding a com- plete idea prior to its material embodiment.

The history of animal forms in times past is the history of the introduction of new ideas, an intro- duction invariably successful at the right time and manner, of remarkable workmanship and invariably based on a transcendent and perfect knowledge of the laws and attributes of matter. A few examples may illustrate: The eye is the most wonderful organ in nature, except the brain. The animal eye and the insect eye are based on totally different principles. The latter uses only a few straight rays of light from an object, received perpendicular on a few out of many thousand facets. The house fly has 4000 such facets, each a complete eye; other flies 25,000. The animal eye refracts all the rays to a focus, using in doing so a whole series of devices, showing marvel- ous ingenuity and astounding knowledge of optics, as the iris, the varying density and curvature of the crystalline lens, the round lens for water and the latter for air, the muscles for varying that curva- ture to adapt vision to near or remote objects, etc. By no possibility could these two radically different principles ever in the remotest past have been the same, or one have developed from the other, or both from something else. By no possibility could either have originated in any animal brain or in the con- sciousness of unconscious matter, nor could the ex- quisite workmanship shown in every detail have been wrought by "environment, exercise, or the in- herent power of the organism," the three alleged causes working with natural selection. Was it frog brain or something lower that first thoroughly under- stood the intricate laws of light and wrought pa- tiently for thousands of years to make a tool for perception of that light of which it had no knowl- edge? The fish eye in water and the animal eye in air require different lenses, but only an antecedent knowledge could have designed them; they could not have grown by degrees, for any degree short of per- fection would have been worthless. The mole eye is not as good as the eagle eye, but it is equally per- fect for its place. Whence came the idea of tear- ducts and lids to wash and shield the eye, things no fish has; or the idea of the nictitating membrane of birds? Not from fishes that needed them not. Yet the first animal living in air that needed such ad- juncts to the eye had them. How did the fixed fish eye change to the movable animal eye? Who sug- gested the new idea? To secure range of vision are three separate ideas: the rolling animal eye, the many facets of the fixed insect eye, and the fixed in- sect eye on a movable stalk. Who suggested to the anabas the desirability of two kinds of eyes, one for air and one for water?

Ruminants, as cattle, digest their food in a differ- ent way from non-ruminants, as horses. The prin- ciples are diverse and not derivable. The earliest animate forms digested only by solvents, as snakes, etc., do yet. Who invented the gizzard? Who in- vented grinding teeth to comminute the food and as- sist the gastric juice? Evolutionists must answer that the gastric juice, after brooding over its hard work, evolved the brilliant conception of a gizzard, and immediately went to work to manufacture it. That may sound absurd, but the idea must have come from somewhere before it was put in bodily form. The fly's foot for walking overhead, the tiger's claws and pad, the horse's hoof, the duck's webbed foot, the perching bird foot, the tree-grasp- ing monkey foot, the arched human foot, embody each a separate and distinct idea. As modes of pro- gression the fish tail, the bird wing, the large slow butterfly wing, the small swift fly wing, legs of land animals, the squirming snake, the extensible foot as in cephalopods, and other methods, are each based on different principles, are *de novo*, different inven- tions, each requiring a preknowledge of nature's laws before the idea itself could be conceived or its execution begun. Ideas are born full size; they do not grow. What seems growth or improvement is only the addition of new ideas. Quadrupeds cushion the jar of striking the ground with the feet by walk- ing on the toes, as the horse; by pads, as cats and camels, and by curving the leg just above; man by the arch of the foot, and other ways. Anthropoid apes have practically no plantar arch. If in some "missing link" an imperfect arch were found, would it alter the fact that the idea of an arch to cushion the step was then a new idea? Lungs and gills are different methods of obtaining the same result. Hair and feathers are different ideas. Warm-blooded mammal may be saved from cold, especially in water, in two ways: by a layer of fat under the skin, as in whales, or by an enclosure of air outside the skin, as in fur seals. The latter device, waterproofing, by making the hairs very small and close, is very orig- inal and beautiful. The hind legs of some quadrupeds bend forward, others backward, and the fore legs are also of two kinds; but it is difficult to see how one kind could gradually shade into the other. Was the intermediate stage a stiff leg? If so, at that point what great advantage in the struggle for ex- istence did the stiff-legged animals have? Or were the legs double-jointed between times, bending both ways? Did the double joint or the stiff joint add speed to the deer or strength to the tiger's paw? Squirrels and monkeys hold food with their two paws; the human hand and opposing thumb is an- other idea. So is that wonderful instrument, the elephant's proboscis—combining the human hand, the fly's suction pump, the monkey's prehensile tail, a trumpet and a club. A high intelligence could at some time conceive of an inside vertebrate skeleton and an outside frame, single as univalves, hinged as bivalves, compound as insects. All these are inher- ently different mental conceptions, by no possibility desirable one from another. The instincts and man- ners of life, as well as bodily form, of ants, bees, beavers and thousands of others, show in every case numerous and novel ideas; and an idea, I cannot too strongly insist, is an indivisible entity and possible only to intelligence and knowledge.

But I must arrest, even with violence, this enum- eration and turn to consider man, in whom is found indisputable proof that forces other than material nature have been and are at work; that some outside agency has from time to time injected new ideas and new devices into the mechanism of the animal king- dom. The boundless variety and ingenuity of these inventions, their bold originality and perfect execu- tion, excite our admiration and amazement. No de- fect is seen, no failure dreamed of, no improvement possible.

Anatomists fail to separate man from the monkey specifically, because each has the same number of bones, muscles, etc. Any schoolboy can instantane- ously assort them. Why? Because the anatomist won't recognize a fact that he cannot cut out and lay on the table. No effort can disguise that the reasoning, self-conscious brain of man embodies ideas boundlessly different from anything known before. Aside from reason, any one of such lesser ideas as fire making, cooking, shooting game, making tools and weapons, wearing clothes, planting seed, culti- vating the soil, making pictures, laughter, language spoken and written, inventions, religion, and moral ideas, differentialize the homo from the highest ape more widely than is the ape from the bird or quad- ruped. It is in line with these facts that we must conclude that somewhere in the infancy of man were ineradicably impressed upon the human body and brain those different ideas we call racial peculiari- ties, and vainly, now and always, strive to reconcile. Nature for some reason relaxed in the human race the iron rule of the infertility of crosses, and the white, black, red and yellow sometimes mix. Only upon the advent of man do the ideas of moral evil and cruelty come upon the scene. They are of a dif- ferent genera. What was their origin?

It is reasonable that there should be a wide range of animal structures, for there was a wide range of conditions on the earth; and if there be ten possible ways of gaining a needed end, as locomotion or di- gestion, a high creative intelligence would be quite apt to employ them all. In nature the individual is of small account, species and genera more, but ideas most of all. It is all one whether we suppose a spec- ial creation for each species, or a special creative in- troduction of each new idea and device. Either re- quires, as does the beginning of life, or any life, the act of a force outside of and superior to material na- ture. This does not eliminate natural generation. If a species of horse with six legs were about to be originated, it is quite possible we should see, as so- called freaks, numerous six-legged colts, and that these freaks would cease to be produced by the old equines as soon as the new "hexequines" had be- come firmly established, and that thereafter crosses would be infertile. This might be called evolution by natural selection, but, in truth, it would be just as much a special creation as if a full-grown pair should drop from the sky some summer morning. What I contend for is the impossibility of accounting by any process of derivation for the origin of new and orig- inal, underived ideas, or for the existence of organs, as sight, smell, hearing, etc., which require an ante- cedent knowledge. If, as I have tried to show, there are in animal structures many ideas not before known, then evolution is in effect an effort to derive something from nothing—an idea from where no idea was.

Many of the changes alleged to be survival of the fittest do not indicate any such superiority in the struggle for existence. Some animals have five toes, others four, three, two or one. There is no advant- age apparent, and all thrive. What advantage did the miohippus with three toes have over the eohip- pus with five toes? Moreover, it seems to be for- gotten that there was nearly always a long period when these supposed better forms were inchoate and therefore worthless, and having for that time no evolutional power.

If the present horse is so different from his ances- tor of the Miocene—a small, three-toed creature the size of a small sheep—why is it that the most ancient remains of man, extending nearly if not quite to the same age, show no difference at all. The lowest fos- sil skull could be matched in London or New York in ten minutes. Probably the cave dwellers could not be matched in America for strength and physical development. If evolution has changed the horse so much, why has it not changed man much more (in- stead of much less or none), for man is progressive and animals are not? If man has not changed at all in a quarter or half million years, when, at the same rate, would he merge into the tadpole?

Truly, the homo may rest secure from ancestral degradation as the product of ideas so numerous, original and brilliant, and separating him so widely from all other forms that derivation by generation or evolution is absolutely impossible.

Auburn, Cal. W. S. PROSSER.

The Witwatersrand Banket, With Notes on Other Gold-Bearing Pudding Stones.*

NUMBER XI.—CONCLUDED.

By GEO. F. BECKER.

I have not been able to learn that pre-Tertiary banket has been discovered in Victoria, but it may be noted here that much of the Tertiary "gold drift" is regarded by the Australian geologists as of marine origin.

In South Australia there is an auriferous conglomerate at Algebuckina, on the Neales river, which, in the opinion of the Government geologist, Mr. H. Y. L. Brown, may be Mesozoic.

In Tasmania gold is found near Hobart, in the coal measures, according to Liversidge. An auriferous conglomerate, the age of which is not stated, has been worked at Beaconsfield, and another such pudding stone is mentioned as occurring at Mount Lyell.

In New Zealand.—In New Zealand auriferous conglomerates are found near the limit of the Cretaceous and Tertiary, and seemingly on the Mesozoic side of the line. Many such localities are enumerated by Mr. Alexander McKay. The most famous is the Blue Spur. This, according to Mr. S. H. Cox, is a Cretaceous river bed or basin. The ore is stamped and a vast amount of work has been done on the deposit. That it has yielded largely seems evident, but I find no statement as to product. The wide distribution of these conglomerates, and the fact that they lie at the base of the coal-bearing series of New Zealand, suggest a doubt as to their fluvial origin.

In India the presence of gold as a detrital product in strata is suspected, but the evidence seems to be of an indirect nature.

Conclusions.—In glancing through these notes on pre-Tertiary auriferous conglomerates, the reader will doubtless remark the fact that only one of them seems to present considerable similitude to river deposits. The remainder seem to be unquestionably marine. The exception is that at Blue Spur in New Zealand. Even in this case the description is not sufficiently explicit to justify anything like an unqualified acceptance of its reference to stream action. On the other hand, more than half of the gold gathered by man in historic and pre-historic times has undoubtedly been derived from Tertiary and post-Tertiary river beds. The contrast in origin between the later and earlier detrital deposits is striking, but very easily explained.

Accumulations of river gravel are superficial continental features of very small stability. Unless they are accidentally protected by lavas which have flowed down the river beds, the gravels are triturated and removed even by ordinary erosive action. Thus in California the discontinuity of the Tertiary gravels shows that vast quantities of this material have been swept away. Were an auriferous area to remain long enough above the sea, it would be cut down to "base level," and the river channels as well as the gravels would be obliterated. If an area marked by the presence of gravels, such as the Sierra Nevada of California, were to sink beneath the ocean at the rate of a few feet a year, most of its surface features would be destroyed or obscured. The advancing waves, creeping slowly up the slope, would cut away the prominent bluffs or hills, leaving a relatively smooth surface. When submersion was complete this slope would be found covered with coarse detrital material, rounded by wave action and sorted by both waves and currents; in short, a basal gravel would be produced, needing only induration to convert it into a basal conglomerate. Now, in this mass there would evidently be incorporated all or most of the river gravels which had enjoyed an independent existence while the range stood above water level. The river gravels, with any gold which they might contain, would merely furnish their quota to the marine littoral conglomerate. Such a conglomerate would contain gold not only derived from the pre-existent river gravels, but also from the detrital material spread broadcast over the land surface, and some or much, too, from the destruction of solid vein-bearing rocks by the advancing waves.

In the pre-Tertiary rocks only those gravels remain which were protected by superjacent beds and allowed to indurate. River gravels, as such, could escape dispersion only when during subsidence they were immediately covered in by fresh deposits, without undergoing any noteworthy wave action, and such conditions would assuredly be very exceptional. Hence the extreme rarity of pre-Tertiary river gravels. The considerations set forth in the preceding paragraph also make it clear how, currents co-operating, great continuous sheets of gold-bearing basal conglomerate may form, and in the notes above it will be observed that many of the known auriferous conglomerates are basal.

In series which show a basal conglomerate there are very frequently other conglomerates intercalated between sandstones or shales. The mechanical theory of such intercalated beds of pudding stone is much more complex than that of the basal conglomerate. It is not needful to enter upon it here. Evidence enough has been given in the preceding pages to show that in ancient formations alluvial gold is most likely to be found in marine shore deposits entirely analogous to the auriferous beaches of the present time.

Gold Deposits, Geology and Geography of Alaska.

NUMBER III.

Gravel Terraces.—The gravels of a modern stream are not necessarily confined to the present bottom of its valley, for, as is well known, the stream is cutting down its bed and reaching a lower level from year to year; moreover, in the existing bottom its ordinary water channel, in which the cutting is done, is constantly changing from side to side. At high stages of water the stream may fill the entire valley, bringing down in its rapid course more material than it can carry away, and when it dwindles again to a comparatively narrow stream it leaves benches or bars of coarser material on either side, which in the course of its subsequent meandering it does not completely remove. Thus there are often found on the sides of the valley, sometimes at considerable heights above the present bottom, gravel benches or terraces which are relics of such flood-plain deposits, left there in high stages of the river, and when the valley bottom stood at about that level. Such gravel terraces are quite common along the upper Yukon and its various tributaries, sometimes standing several hundred feet above the present stream. Where not too high the terrace gravels often yield gold in paying quantities; but the quantity of this gold will necessarily be dependent, first, upon the gold-bearing quality of the rocks from which they were derived, and, second, upon the distance they have been carried and the configuration of the bedrock, which might or might not favor the concentration of the gold in certain spots. The successively higher terraces spread over broader and broader areas, but in a broad body of water the chances for concentration are less favorable than in one confined within a narrow valley or gorge. In some of the older mining districts, notably the Cassiar district, around Dease lake and the head of Stikine river, from which over $7,000,000 worth of gold was taken, a considerable protion is said to have been derived from terrace gravels. In general, however, they can not be expected to be as rich as the gulch gravels; but when collected in sufficient quantities and in such situations that it is possible to bring a considerable head of water to bear upon them, they may be profitably worked by the hydraulic process, as their elevation renders easy the carrying away of the tailings from the sluices. They may, moreover, have furnished important additions to the gold contents of stream gravels, where they would have been reassorted and concentrated by the action of water.

The same general remarks may be applied to gravel terraces about lake basins which may have been formed at higher stages of the lake waters. In the Silver Bow basin, near Juneau, which was once occupied by a lake, the lake beds have been found gold-bearing only on the side receiving drainage from an area where the rocks are known to be gold-bearing.

Recent Stream Gravels.—Recent stream gravels may by divided into two chief classes' bars and gulch gravels.

Bars.—In the larger streams accumulations of gravel and sand are made in places of slackening current, such as the inner side of curves, or at points where considerable coarse material is brought into the main stream by more rapid tributaries. Such accumulations are called "bars," and often contain much gold. In some cases practically the entire mass of gravel and sand in a river bed contains enough gold to pay working by mechanical processes which admit of the handling of large amounts of material at a very small cost. In earlier times the stream or river was sometimes turned from its course in order to admit of handling such material.

At the present day it has been proved that in most cases such gravel bars can be worked more effectually and cheaply by floating dredges, which raise the gravels to suspended sluices. It is not known whether the bars of the Yukon have yet been tested for gold, but there can be little doubt that they contain it in considerable amount, and it seems probable that those in the upper stretches of the river, especially near streams that drain known gold-bearing areas, will be found to be rich. Whether climatic and other conditions are such that dredging can be carried on with success must be determined by practical experiment.

Gulch Gravels.—Coarse gold can not, under ordinary circumstances, be carried very far by running water; hence it is in the gulches that the rich deposits of coarse gold are ordinarily found, and in the side gulches that it is generally the coarsest, as in them the gravel is nearest its source. It is not always actually running water that has concentrated the gold; the metal is so much heavier than rock material that a relatively slight disturbance of loose material, if continued long enough, will result in settling most of the large particles at or near the bedrocks. Still, that running water is the most important factor in the concentration of gold is shown by the fact that this concentration is greatly dependent on the nature of the bedrock; where this presents a rough, ragged surface, especially where ridge-like protrusions run across the stream, like the riffles in a sluice box, the gold is more readily caught and the gravels resting in it are much richer than where the surface is smooth, even, and without many cracks. Thus the experienced miner knows that where there is a narrow dike of harder rock, or, still better, a series of hard schistose rocks standing on edge that cross the gulch in which he is working, he is liable to find the richest concentration of gold, and that in the latter case it may even settle down into the cracks of the bedrock for several feet. The lowest channel does not necessarily correspond with that of the present stream, since the latter, as already noted, is frequently changing its course within the material accumulated in the long years during which it has been flowing, and it may have been pushed to one side or the other of the valley by landslides. The actual pay dirt is generally confined within comparatively few feet of the bedrock. Sometimes the miner finds what he calls a false bedrock, which is generally a clayey seam that marks some special stage in the history of the stream. The amount or the depth of gravel in the bottom of a gulch or valley is dependent on its size and shape, and the experienced eye can estimate approximately what it is by mentally carrying down the outlines of the rock surface on either side of the valley to a meeting under the gentler-sloping valley bottom. It is also, naturally, much thinner near the head of a gulch, and in this region, where these heads are frequently occupied by glaciers or bodies of perennial ice and snow, they generally have a rounded, amphitheater-like shape, the breaking down of the rock occurring mainly at its contact with the ice. In the great diurnal changes of temperature of the short summer months of this region the water seeping into rock cracks by day is frozen at night, and by its expansion pries off fragments from the cliffs. The material thus loosened gradually slips down; but, as a rule, not until it has been moved for a considerable distance, ordinarily some miles down the valley, is the gold thoroughly settled to the bottom along the bedrock surface.

The general character of the gravel, and of the gold itself in the gulches that have been studied, such as those in the Forty-Mile and Birch Creek districts, shows that the gravels have not been carried very far. The rock fragments are not completely rounded; they are generally rather angular, and often quite flat. The gold also is not completely rounded.

Characteristics and Distribution of Known Placers.—The extraordinarily rich placer deposits of the gulches tributary to the Klondike river above Dawson, and of similar gulches of the nearby Indian creek and Stewart river, have been so recently opened that no detailed geological description of these localities has yet been received. In his report, however, Spurr had shown that the strike of the gold-bearing rocks in the Forty-Mile district, and the exposures observed along the Yukon, indicated that their gold must have been derived from the same gold-bearing formations that had furnished the richest placers in the districts visited by him. A brief statement of the prominent characteristics of these districts as given by him will therefore probably be of value to the prospector. Geology can give only general indications and point out where gold may be found. The actual location of rich concentrations must be determined by the miner himself.

The hills surrounding the gulches of the Little Mynook and Hunter creeks, on the lower Yukon, are formed of rocks of the Rampart series. The bedrocks are of diabase, tuffs, impure shales, and quartzites, and in the bottoms of the gulches there is from 10 to 20 feet of gravel. The gravel consists in part of angular fragments of rocks that form the walls of the gulch, in part of waterworn pebbles of Birch creek schist, schistose granite, and other rocks. The gold is generally in rounded, bean-shaped grains and nuggets, and less frequently in unworn particles. This points to a two-fold origin of the gold, as derived in part from the rocks immediately about and in part from distant and older rocks, which may have been worn down, possibly along an old seashore, into terrace gravels, and then by subsequent erosion brought into the present stream beds. Further exploration in the hills to the south may disclose the true source of these pebbles and of the gold that accompanies them. On American creek, in the Mission Creek district, the gold-bearing placers are also derived from rocks of the Rampart series—quartzitic schists, serpentines, and chloritic rocks—and the gold is said by Spurr to have been derived mainly from the schistose zones in the bedrock.

(*To be Continued.*)

Coast Industrial Notes.

—The price of Oregon sheep has increased from $1.50 to $2 per head.

—Grading has begun on the Stockton & Tuolumne County, Cal., railroad.

—Ventura, Cal., proposes to issue $20,000 40-year bonds for a new electric-light plant.

—The California Powder Works at Santa Cruz, Cal., has a Government order for 3,000,000 pounds brown prismatic powder.

—The Oregon Railroad & Navigation Co. has declared a 1 per cent dividend on its preferred stock, payable this month, $110,000.

—The steel ferryboat of the Southern Pacific Co. will next August be placed on the San Francisco ferry service. The steamer will be 289 feet long, 64 feet beam.

—Work has began on the Ohio Canal Co.'s ditch from the Colorado river, twenty miles from Ehrenburg, Arizona. When completed, the canal will be twenty-two miles long.

—The steamer Wellington, from Comox, B. C., has arrived at San Francisco with a cargo of coke—believed to be the first ship arriving with a full cargo of coke of Pacific coast manufacture.

—A fir log was recently cut in Skagit county, Wash., that scaled 32,444 feet. It was 48 feet long and nearly 9 feet in diameter. Another fir log scaled 16,000 feet, and weighed 68,000 pounds.

—The sugar plant in construction at La Grande, Oregon, will cost $400,000. To keep the plant in operation requires 350 tons of beets a day and 7000 cords of wood for its season of operation, about 100 days.

—The report of the Broken Hill Proprietary Co., of Australia, whose head office is in Melbourne, shows that this concern is the largest consumer of Douglas fir in the world. For the six months ending Nov. 30th, '97 the expenses for mine timber amounted to over $75,000.

—The San Gabriel Electric Co. expects to have its plant delivering power in Los Angeles, Cal., this month. There are eight miles of tunnels and ditches and a fall of 400 feet; the pipe is 36 inches in diameter. Eight wheels, each 48 inches in diameter, will each deliver 275 H. P. to a dynamo.

—The British Columbia salmon pack for last season gives the following totals: Fraser river pack, 860,459 cases; Skeena river, 65,905; Rivers inlet, 40,207; Naas river, 20,847; Lowe inlet, 10,666; Namu harbor, 4357; Alert bay, 8602; west coast Vancouver island, 4434. Total pack for the season, 1,015,477 cases, compared with 601,570 the previous season.

—The cargo trade of the lumber mills of British Columbia amounted in 1897 to 68,000,000 feet, valued at $608,989. Of this amount the United States received about 250,000 feet. Australia bought nearly one-third of the total exported, Europe about one-fourth, China one-eight, also Japan. Of the sixty-four cargoes twenty-seven went from Vancouver and seventeen from Chemainus.

—At Portland, Or., Inman & Poulson have begun the construction of a lumber raft, to be towed to San Francisco. It will be built upon a cradle of heavy timbers, bolted and chained, and will hold 5,000,000 feet of lumber, which is as much as ten ordinary lumber vessels can carry. The lumber will be placed in layers alternating each other crosswise, then secured by chains, to make the mass solid and compact. It will be 200 feet in length, 30 feet wide and 28 feet deep.

—The exports of silver from the Pacific coast during February were as follows:

	1898.	1897.	Changes.
Silver bars	$ 381,100	$ 542,910	Dec.$ 161,810
Mexican dollars.	89,348	696,980	Dec. 607,632
Peruvian soles..	26,460	5,100	Inc. 21,360
U. S. silver	1,000	97,000	Dec. 96,000
Totals	$ 497,908	$1,341,990	Dec.$ 844,082
For two months.			
Silver bars	$ 715,700	$1,055,450	Dec.$ 339,750
Mexican dollars.	586,519	1,242,911	Dec. 656,392
Peruvian soles..	37,040	8,300	Inc. 28,740
U. S. coin	2,082	119,000	Dec. 116,918
Totals	$1,344,341	$2,425,661	Dec.$1,081,320

—Gen. Agt. Maze of the Union Pacific says: "The Vanderbilts, in co-operation with the Morgan interest, have secured the control of the Oregon Short Line stock, and in its purchase they have secured the controlling interest in the Oregon Navigation Co. The Vanderbilts asked for the presidency for Mr. Burt, and the office was accordingly given to him. The consolidation controls the Ogden gateway and with it the great Northwest. The Vanderbilts control the New York Central from New York to Chicago; the Chicago & Northwestern from Chicago to Council Bluffs, Ia.; and the Union Pacific from Council Bluffs to Ogden, and a controlling interest sufficient for a freeze-out of the other interests in the Short Line and the Oregon Ry. & Navigation Co. The total length of the line will be, including the branches, over 6000 miles, and, exclusive of the New York Central, this line across the country will be known as the Union Pacific. It is believed that as soon as the details are completed that a new force of officers for the two roads leading out of Salt Lake City will be appointed. The additional mileage to the present Union Pacific system will be 1705 miles of road. The Short Line runs from Granger, Wyo., in a northwesterly direction to Huntington, Or., where it joins the Oregon Ry. & Navigation Co., which runs to Portland, a distance of 945 miles. Another branch runs from Salt Lake to Frisco, Utah, 275 miles, while still another branch runs northward from Salt Lake. The idea of constructing a line of 400 miles from Frisco, Utah, across Nevada to Vanderbilt, Cal., the terminal of a Los Angeles line, has been discussed, but it is feared that the Southern Pacific would retaliate by turning over all their Pacific coast business to the Rio Grande Western at Ogden." Mr. Maze says that when all the details are ended, however, that the Southern Pacific will be found in the consolidation, or its influence represented in the board of directors of the new company.

Personal.

G. P. BLAIR is the new Supt. Mammoth mines, Tucson, Ariz.

PH. DEIDESHEIMER has returned to San Francisco from Skaguay.

W. F. DETERT, Supt. Zella mine, Jackson, Cal., is in San Francisco.

D. HARMON, Supt. Gaston Ridge mine, Graniteville, Cal., is in San Francisco.

R. DILLON, Pres. Jerome Copper Co., Jerome, Ariz., has returned home from Denver.

J. ROSS, JR., Supt. Wildman-Mahoney mine, Sutter Creek, Cal., is in San Francisco.

D. KEITH, managing owner Silver King mine, Park City, Utah, is in San Francisco.

G. DAY, Supt. Enterprise mine, East Fork, Cal., has returned home from San Francisco.

CHAS. H. KROUSE has been appointed Supt. Tamarack and Osceola mills, Houghton, Mich.

F. W. BACORN has been appointed receiver of the American D. & M. Co., at Gibsonville, Idaho.

F. S. ROUMAGE, Supt. Horseshoe Bar G. M. Co., Michigan Bluff, Cal., has recovered his health.

F. F. THOMAS, Supt. Gwin mine, Mokelumne Hill, Cal., has returned home from Nevada Co., Cal.

J. E. SEXTON, Supt. Cleveland mine, Placerville, Cal., has returned home from San Francisco.

C. HELMAN, Supt. Spring Valley M. Co., Cherokee, Cal., has returned home from San Francisco.

J. B. MATO has been appointed Gen. Mgr. Old Reliable M. Co., with headquarters at Golden, N. M.

J. R. PHILLIPS, Gen. Mgr. Amador Queen No. 2, Jackson, Cal., has returned home from San Francisco.

GEO. CLARK has resigned as Supt. Chloride Point, Mercur, Utah. His successor has not yet been named.

GEO. P. THURSTON, Sec'y Orleans M. Co., has moved to his new quarters, 324 Pine St., San Francisco.

H. T. SCOTT of the Union Iron Works has returned from a successful business trip to Washington, D. C.

A. H. TEN BROECK, Supt. Gold Bug mine, Georgetown, Cal., was in attendance Executive Committee meeting, San Francisco, this week.

HERMAN DAVIS AND A. HERIVAL of Dayton, Nev., will go to Guanajuato, Mexico, to test a lot of tailings with a view to treating them on a large scale.

PROF. J. G. ALLEN, mining engineer for Mariner & Hoskins, Chicago, Ill., is expected in San Francisco soon from Montana, where he has been on a business and pleasure trip.

H. E. PICKET, managing owner Grand Victory mine, Placerville, Cal., was in San Francisco this week attending a meeting of the Executive Committee State Miners' Association.

PROF. J. E. KEELER, recently elected director of the Lick Observatory, will decline the position if within "a reasonable time" the trustees of the observatory at Allegheny, Penn., where he is at present employed, can raise $200,000 to build and equip there a new observatory. To the 25th ult. $137,000 had been subscribed thereto.

W. BEDDIG, representing the Krupp Bros. at Essen, Germany, is in Salt Lake City. He is visiting the State in search of uranium. This is one of the "rare earths," and of economic value for hardening gun metal and armor plate. It is quoted at 60c per gram, $2.50 per lb. It was recently reported discovered in commercial quantities at Black Hawk, Colo.

Recent California Mining Incorporations.

The Oro Fino Gravel Mining Company, San Francisco; capital stock, $500,000; George A. Pope, William H. Taylor Jr., Augustus B. Taylor, Robert S. Moore and William E. Miles.

Hardy G. M. & M. Co., San Francisco; capital stock, $1,500,000; subscribed $140,000; E. Lichan, I. I. Brown, A. T. Vogelsang, W. Garrard, W. G. Drown.

Placerita C. M. & I. Co., Los Angeles; J. G. Evans, W. Hogan, A. C. Harmon, W. W. Ross, C. B. Ford.

Bonanza G. M. Co., Stockton; capital stock $300,000, subscribed $200,000; J. L. Bryson, C. H. Patterson, F. A. McCan, F. W. Rathentrust, G. Miller.

California M. & T. Co., San Francisco; capital stock $500,000, subscribed $310; J. R. Kendall, J. Fanbul, E. C. Loftus, C. W. Ormsby, F. H. Barnes.

Bown M. Co., San Francisco; capital stock $1,000,000, subscribed $50; W. J. Rule, P. Rowe, G. Rowe, J. M. W. Wright, E. S. Vance.

Recently Declared Mining Dividends.

Lillie, Colorado, 1 cent per share, $9000; payable April 1.

Moon-Anchor, Colorado, 2½ cents per share, $15,000; payable April 2.

Standard Con., California, 10 cents per share, $20,000; March 28.

Horn Silver, Utah, 5 cents per share, $20,000; April 1.

Obituary.

There died in West Liberty, Iowa, on the 16th ult., a man who never touched anything with his pen that he did not adorn, and who was a part of the mining life in this west half of America for over a generation. Reference is made to William Wright, known and hailed by every mining man on this coast as "Dan de Quille." Just thirty-seven years ago he began newspaper work as a mining reporter on the Virginia City, Nevada, *Enterprise*, and even among newspaper men, whose work is prodigious, he was a noted example of versatility. He was always writing something and was always at home on all themes, however divergent.

Mark Twain and he were on the same paper, and no one could ever tell from reading the jokes in that once famous newspaper which were Mark Twain's and which were Dan de Quille's. Some famous mining experts were on the Comstock in those days; but, unless signed, a scientific dissertation on mining or metallurgy would be credited alike to Dan de Quille or a mining engineer. A Sunday sketch on the fancy flow in that arid region of a babbling brook would flow as deliciously from his pen as an authentic account of a scrap on the 1700-foot level of the Yellow Jacket.

He was an ideal newspaper man, a heavensent humorist, and one of the most delightful all-around workers that ever ground out copy for the printers. He was a philosopher to the last, and though wrecked by disaster and racked with pain, steadily kept to the end his sunny nature.

Until his departure from Virginia City about a year ago, he kept up his old-time habit of sending desultory essays on sundry mining matters to the MINING AND SCIENTIFIC PRESS; and his last letter to the editor of this paper, just before his departure, was devoted largely to the details of an intended journey down the Mississippi to New Orleans, which he contemplated with much satisfaction. But he has taken a longer journey, and the memory of one of the best men that ever lived will long be with those who knew his genial nature.

F. L. PERKINS, mining expert and mine superintendent, died at Alameda, Cal., on the 27th ult. Deceased was well known in California, Nevada, Idaho and Montana. He was formerly Supt. Granite Mountain and Hope mines in Idaho.

Pennsylvania's Coal Production.
